industry. A large quantity of iron, copper and other ores is smelted
in the blast-furnaces of Saint Louis in the vicinity and in other
foundries scattered over the country. The workshops of the
companies have large workshops for the construction or repair of
marine steam-engines and every branch of iron ship-building. To
these industries must be added flour-milling, the manufacture of
semolina and other farinaceous foods and of biscuits, bricks and
tiles, rope, casks, capsules for bottles and other tin-goods, tanning,
distilling, brewing and sulphur-and sugar-refining. There are state
tobacco and match factories.

History.—The Greek colony of Massalia (Lat. Massilia) was
founded by the mariners of Phocaea in Asia Minor, about 600 B.C.
The settlement of the Greeks in waters which the Carthaginians
reserved for their own commerce was not effected without a naval
conflict; it is not improbable that the Phoenicians were settled
at Marseilles before the Greek period, and that the name of the
town is the Phoenician for "settlement." Whether the judges
(sophetim, "suffetes") of the Phoenician sacrificial table of
Massalia were the rulers of a city existing before the advent of
the Phocaens, or were consuls for Punic residents in the Greek
period, is disputed. In 542 B.C. the fall of the Phocaean cities
before the Persians probably led to a considerable reduction in the
importance of the city of Massalia from close connexion with the
mother country. Isolated amid alien populations, the
Massalians made their way by prudence in dealing with the
inland tribes, by vigilant administration of their oligarchical
government, and by frugality united to remarkable commercial
and naval enterprise. Their colonies spread east and west
along the coast from Monaco to Cape St Martin in Spain,
carrying with them the worship of Artemis; the inland trade,
in which wine was an important element, can be traced by finds
of Massalian coins across Gaul and through the Alps as far as Tirol.
In the 4th century B.C. the Massaliot Pytheas visited the coasts
of Gaul, Britain and Germany, and Euthymenes is said to have
sailed down the west coast of Africa as far as Senegal.
The great rival of Massalian trade was Carthage, and in the Punk Wars
the city took the side of Rome, and was rewarded by Roman assistance
in the subjugation of the native tribes of Liguria. In the war
between Caesar and Pompey Massilia took Pompey's side and
in A.D. 49 offered a vain resistance to Caesar's lieutenant Trebonius.
In memory of its ancient services the city, "without which,"
as Cicero says, "Rome had never triumphed over the Transalpine
nations," was left as a civitas libera, but her power was broken
and most of her dependencies taken from her. From this time
Massilia has little place in Roman history; it became for a time
a port of call for the transportation of letters and medicine, but its commercial
and intellectual importance declined. The town appears to
have been christianized before the end of the 3rd century, and
at the beginning of the 4th century was the scene of the martyr-
dom of St Victor. Its repute partly revived through the
names of Gennadius and Cassian, which give it prominence

MARSEILLES 767
MARSH, A.—MARSH, H.

in the history of Semi-Pelagianism and the foundation of western monachism.

After the ravages of successive invaders, Marseilles was repopulated in the 10th century under the protection of its viscounts. The town gradually bought up their rights, and at the beginning of the 13th century was formed into a republic, governed by a podesta, who was appointed for life, and exercised his office in conjunction with 3 notables, and a municipal council, composed of 80 citizens, 3 clerics, and 6 principal tradesmen. During the rest of the middle ages, however, the higher town was governed by the bishop, and had its harbour at the creek of La Joliette which at that period ran inland to the north of the old town. The southern suburb was governed by the abbot of St Victor, and owned the Port des Catalans. Situated between the two, the lower town, the republic, retained the old harbour, and was the most powerful of the three divisions. The period of the crusades brought prosperity to Marseilles, though throughout the middle ages it suffered from the competition of Pisa, Genoa and Venice.

In 1245 and 1256 Charles of Anjou, count of Provence, whose predecessors had left the citizens a large measure of independence, established his authority above that of the republic. In 1423 Alphonso V. of Aragon sacked the town. King René, who had made it his winter residence, however, caused trade, arts and manufactures again to flourish. On the embodiment of Provence in the kingdom of France in 1451, Marseilles preserved a separate administration directed by royal officials. Under Francis I. the disaffected constable Charles de Bourbon vainly besieged the town with the imperial forces in 1524. During the wars of religion, Marseilles took part against the Protestants, and long refused to acknowledge Henry IV. The loss of the ancient liberties of the town brought new disturbances under the Fronde, which Louis XIV. caused in person to suppress. He entered the town by a breach in the walls and afterwards had Fort St Nicolas constructed. Marseilles repeatedly suffered from the plague, notably from May 1720 to May 1721.

During the Revolution the people rose against the aristocracy, who up to that time had governed the commune. In the Terror they rebelled against the Convention, but were promptly subdued by General Carteaux. The wars of the empire, by dealing a blow to their maritime commerce, excited the hatred of the inhabitants against Napoleon, and they hailed the return of the Bourbons and the defeat of Waterloo. The news of the latter provoked a bloody reaction in the town against those suspected of imperialism. The prosperity of the city received a considerable impulse from the conquest of Algeria and from the opening of the Suez Canal.

MARSH, ADAM (ADAM DE MARISCO) (d. c. 1258), English Franciscan, scholar and theologian, was born about 1200 in the diocese of Bath, and educated at Oxford under the famous Grosseteste. Before 1226 Adam received the benefice of Wearmouth from his uncle, Richard Marsh, bishop of Durham; but between that year and 1230 he entered the Franciscan order. About 1235 he became the lecturer of the Franciscan house at Oxford, and within a few years was regarded by the English province of that order as an intellectual and spiritual leader. Roger Bacon, his pupil, speaks highly of his attainments in theology and mathematics. His fame, however, rests upon the influence which he exercised over the men of his day.

Consulted as a friend by Grosseteste, as a spiritual director by Simon de Montfort, the countess of Leicester and the queen, as an expert lawyer and theologian by the primate, Boniface of Savoy, he did much to guide the policy both of the opposition and of the court party in all matters affecting the interests of the Church. He shrank from office, and never became provincial minister of the English Franciscans, though constantly charged with responsible commissions. Henry III. and Archbishop Boniface unsuccessfully endeavoured to secure for him the see of Ely in 1256. In 1257 Adam's health was failing, and he appears to have died in the following year. To judge from his corres-

spondence he took no interest in secular politics. He sympathized with Montfort as with a friend of the Church and an unjustly treated man; but on the eve of the baronial revolution he was on friendly terms with the king. Faithful to the traditions of his order, he made it his ambition to be a mediator. He rebuked both parties in the state for their shortcomings, but he did not break with either.

See his correspondence, with J. S. Brewer's introduction, in Monumenta franciscana, vol. i. (Rolls ser., 1858); the biographical notice in A. G. Littled's Grey Friars in Oxford (Oxford, 1862), where some of his sermons are quoted, and the references are collected. On Marsh's relations with Grosseteste, see Robert Grosseteste epistolæ, ed. H. R. Luard (Rolls ed., 1861), and F. S. Stevenson, Robert Grosseteste (London, 1890). (H. W. C. D.)

MARSH, GEORGE PERKINS (1801-1882), American diplomatist and philologist, was born at Woodstock, Vermont, on the 15th of March 1801. He graduated at Dartmouth College in 1820, was admitted to the bar in 1825, and practised law at Burlington, Vermont, devoting himself also with ardour to philological studies. In 1835 he was a member of the Supreme Executive Council of Vermont, and from 1843 to 1849 he was a Whig representative in Congress. In 1849 he was appointed United States minister resident in Turkey, and in 1852-1853 discharged a mission to Greece in connexion with the imprisonment by the authorities of that country of an American missionary, Dr Jonas King (1792-1869). He returned to Vermont in 1854, and in 1857 was a member of the state railway commission.

In 1861 he became the first United States minister to the kingdom of Italy, and died in that office at Vallombrosa on the 23rd of July 1882. He was buried in a Protestant cemetery in Rome. Marsh was an able linguist, writing and speaking with ease the classical and modern European languages, a remarkable philologist for his day, and a scholar of great breadth, knowing much of military science, engraving and physics, as well as of Icelandic, which was his specialty. He wrote many articles for Johnson's Universal Cyclopedia, and contributed many reviews and letters to the Nation. His chief published works are: A Compendious Grammar of the Old Northern or Icelandic Language (1838), compiled and translated from the grammars of Rask; The Camel, its Organisation, Habits, and Uses, with Reference to his Introduction into the United States (1836); Lectures on the English Language (1860); The Origin and History of the English Language (1862; revised ed., 1885); and Man and Nature (1865). The last-named work was translated into Italian in 1872, and, largely rewritten, was issued in 1874 under the title The Earth as Modified by Human Action; a revised edition was published in 1889. He also published a work on Medieval and Modern Saints and Miracles (1876). His valuable library was presented in 1883 by Frederick Billings to the university of Vermont. His second wife, Caroline (Crane) Marsh (1816-1901), whom he married in 1839, published Wolfe of the Knoll and other Poems (1860), and the Life and Letters of George Perkins Marsh (New York, 1888). This last work was left incomplete, the second volume never having been published. She also translated from the German of Johann C. Bieratzki (1795-1840), The Hallig; or the Sheepfold in the Waters (1836).

MARSH, HERBERT (1757-1839), English divine, was born at Faversham, Kent, on the 10th of December 1757, and was educated at St John's College, Cambridge, where he was elected fellow in 1782, having been second wrangler and second Smith's prizeman. For some years he studied at Leipzig; and between 1793 and 1801 published in four volumes a translation of J. D. Michaelis's Introduction to the New Testament, with notes of his own, in which he may be said to have introduced German methods of research into English biblical scholarship. His History of the Politics of Great Britain and France (1799) brought him much notice and a pension from William Pitt. In 1807 he was appointed Lady Margaret professor of divinity at Cambridge, and lectured to large audiences on biblical criticism, substituting English for the traditional Latin. Both here, and afterwards as bishop of Llandaff (1816) and of Peterborough (1819), he stoutly opposed
hymn-singing, Calvinism, Roman Catholicism, and the Evangelical movement, as represented by Charles Simeon and the Bible Society. Among his writings are Lectures on the Criticism and Interpretation of the Bible (1828), A Comparative View of the Churches of England and Rome (1814), and Horae Pelagianae (1815). He died at Peterborough on the 1st of May 1839.

MARCH, NARCISSUS (1658–1713), archbishop of Dublin and Armagh, was born at Hannington, Wiltshire, and educated at Oxford. He became a fellow of Exeter College, Oxford, in 1678. In 1682 he was ordained, and presented to the living of Swindon, which he resigned in the following year. After acting as chaplain to Seth Ward, bishop of Exeter and Salisbury, and Lord Chancellor Clarendon, he was elected principal of St Alban Hall, Oxford, in 1673. In 1679 he was appointed provost of Trinity College, Dublin, where he did much to encourage the study of the Irish language. He helped to found the Royal Dublin Society, and contributed to it a paper entitled Introductory Essay to the Doctrine of Sounds (printed in Philosophical Transactions, No. 156, Oxford, 1684). In 1683 he was consecrated bishop of Ferns and Leighlin, but after the accession of James II he was compelled by the turbulent solildary to flee to England (1689), where he became vicar of Gresford, Flint, and canon of St Asaph. Returning to Ireland in 1691 after the battle of the Boyne, he was made archbishop of Cashel, and three years later he became archbishop of Dublin. About this time he founded the Marsh Library in Dublin. He became archbishop of Armagh in 1703. Between 1699 and 1711 he was six times a lord justice of Ireland. He died on the 2nd of November 1713.

MARCH, OTHNIEL CHARLES (1831–1899), American palaentologist, was born in Lockport, New York, on the 29th of October 1831. He graduated at Yale College in 1856, and studied geology and mineralogy in the Sheffield scientific school, New Haven, and afterwards palaentology and anatomy in Berlin, Heidelberg and Breslau. Returning to America in 1866 he was elected professor of vertebrate palaeontology at Yale College, and there began the researches of the fossil vertebrata of the western states, whereby he established his reputation. He was aided by a private fortune from his uncle, George Peabody, whom he induced to establish the Peabody Museum of Natural History (especially devoted to zoology, geology and mineralogy) in the college. In May 1871 he discovered the first pterodactyl remains found in America, and in subsequent years he brought to light from Wyoming and other regions many new genera and families, and some entirely new orders of extinct vertebrata, which he described in monographs or periodical articles. These included remains of the Cretaceous toothed birds Hesperornis and Ichthyornis, the Cretaceous flying-reptiles (Pteranodon), the swimming reptiles or Mosasauria, and the Cretaceous and Jurassic land reptiles (Dinosauria) among which were the Brontosaurus and Atlantosaurus. The remarkable mammals which he termed Brontotheria (now grouped as Thalatherium), and the huge Dinocerata, one being the Uintatherium, were also brought to light by him. Among his later discoveries were remains of early ancestors of horses in America. On becoming vice-president of the American Association for the Advancement of Science in 1875 he gave an address on the "Introduction and Succession of Vertebrate Life in America," summarizing his conclusions to that date. He repeatedly organized and often accompanied scientific exploring expeditions in the Rocky Mountains, and their results tended in an important degree to support the doctrines of natural selection and evolution. He published many papers on these, and found time—besides that necessarily given to the accumulation and care of the most extensive collection of fossils in the world—to write Odontorhines: A Monograph on the Extinct Toothed Birds of North America (1885); Dinocerata: A Monograph on an Extinct Order of Gigantic Mammals (1884); and The Dinosaurs of North America (1896). His work is full of accurately recorded facts of permanent value. He was long in charge of the division of vertebrate palaeontology in the United States Geological Survey, and received many scientific honours, medals and degrees, American and foreign. He died in New Haven on the 18th of March 1899.

See obituary by Dr Henry Woodward (with portrait) in Geol. Mag. (1899). p. 237.

MARSH (O. F. merse, for merse, a place full of "meres" or pools; cf. Ger. Meer, sea, Lat. mare), an area of low-lying watery land. The significance of a marsh area is not so much in the manner of its formation as in the peculiar chemical and physical results that accompany it, and its relation to the ecology of plant and animal life. Chemically it is productive of such gases as arise from decomposing vegetation and are transitory in their effects, and in the production of hydrated iron oxide, which may be seen floating as an iridescent scum at the edge of rusty, marshy pools. This sinks into the soil and forms a powerful iron cement to many sandstones, binding them into a hard local mass, while the surrounding sandstones are loose and friable. A curious morphological inversion follows in a later geological period, the marsh area forming the hard cap of a hill (see Mesa) while the surrounding sandstones are weathered away. Salt marshes are a feature of many low-lying sea-coasts and areas of inland drainage.

MARCHAL (med. Lat. maresculesc, from O.H.G. marh, horse, and scale, servant), a title given in various countries to certain military and civil officers, usually of high rank. The origin and development of the meaning of the designation is closely analogous with that of constable (q.v.). Just as the title of constable, in all its medieval and modern uses, is traceable to the style and functions of the Byzantine count of the stable, so that of marshal was evolved from the title of the marescule, or masters of the horse, of the early Frankish kings. In this original sense the word survived down to the close of the Holy Roman empire in the titular office of Erb-Marchsch (arch-marshal), borne by the electors of Saxony. Elsewhere the meaning of office and title was modified. The importance of cavalry in medieval warfare led to the marshalship being associated with military command; this again led to the duty of keeping order in court and camp, of deciding questions of chivalry, and to the assumption of judicial and executive functions. The marshal, as a military leader, was originally a subordinate officer, the chief command under the king being held by the constable; but in the 12th century, though still nominally second to the constable, the marshal has come to the forefront as commander of the royal forces and a great officer of state. In England after the Conquest the marshalship was hereditary in the family which derived its surname from the office, and the hereditary title of earl-marshall originated in the marriage of William Marshal with the heiress of the earldom of Pembroke (see Earl Marshal). Similarly, in Scotland, the office of marischal (from the French maréchal), probably introduced under David I, became in the 14th century hereditary in the house of Keith. In 1485 the Scottish marischal became an earl under the designation of earl-marischal, the dignity coming to an end by the attainder of George, 10th earl-marischal, in 1716. In France, on the other hand, though under Philip Augustus the marshal of France (marescules Franciae) appears as commander-in-chief of the forces, care was taken not to allow the office to become descendible; under Francis I the number of marshals of France was raised to two, under Henry III. to four, and under Louis XIV. to twenty. Revived by Napoleon, the title fell into abeyance with the downfall of the Second empire.

In England the use of the word marshal in the sense of commander of an army appears very early; so Matthew Paris records that in 1214 King John constituted William, earl of Salisbury, maresculesc of his forces. The modern military title of field marshal, imported from Germany by King George II. in 1736, is derived from the high dignity of the maresculesc in a roundabout way. The maresculesc campi, or maréchal des champs, was originally one of a number of officials to whom the name, with certain of the functions, of the marshal was given. The marshal, being responsible for order in court and camp, had to employ subordinates, who developed into officials often but nominally dependent upon him. On military expeditions it was usual for two such marshals to precede the army, select the site of the camp and assign to the lords and knights their places in it.
time of peace they preceded the king on a journey and arranged for his lodging and maintenance. In France maréchal des logis is the title of superior non-commissioned officers in the cavalry.

Similarly at the king's court the marésculcus alae or intrinsecus was responsible for order, the admission or exclusion of those seeking access, ceremonial arrangements, &c. Such "marshals" were maintained, not only by the king, but by great lords and ecclesiastics. The more dignified of their functions, together with the title, survive in the various German courts, where the court marshal (Hofmarschall) is equivalent to the English lord chamberlain. Just as the marésculcus intrinsecus acted as the vicar of the marshal for duties "within" the court, so the marésculcus forinsecus was deputed to perform those acts of serjeancy due from the marshal to the Crown "without." Similarly there appears in the statute 5 Edw. III. cap. 8, a marésculcus banci regii (marchal du Banc du Roy), or marshal of the king's bench, who presided over the Marshalsea Court, and was responsible for the safe custody of prisoners, who were likewise known as the marésculcha, or Marsheasea prison. The office of marshal of the queen's bench survived till 1840 (see Lord Steward; and Marshalsea).

The official known as a judge's marshal, whose office is of considerable antiquity, and whose duties consisted of making abstracts of indictments and pleadings for the use of the judge, still survives, but no longer exercises the above functions. He accompanies a judge of assize on circuit and is appointed by him at the beginning of each circuit. His travelling and other expenses are paid by the judge, and he receives an allowance of two guineas a day, which is paid through the Treasury. He introduces the high sheriff of the county to the judge of assize on his arrival, and swears in the grand jury. For the French maréchaussée see France: § Law and Institutions.

In the sense of executive legal officer the title marshall survives in the United States of America in various senses. The United States Marshal is the principal officer of the Federal courts, one being appointed for each district, or exceptionally, one for two districts. His duties are to open and close the sessions of the district and circuit courts, serve warrants, and execute throughout the district the orders of the court. There are United States marshals also in Alaska, Hawaii, Porto Rico and the Philippines. They are appointed by the President, with the advice and consent of the Senate, for a term of four years, and, besides their duties in connexion with the courts, are employed in the service of the internal revenue, public lands, post office, &c. The temporary police sworn in to maintain order in times of disturbance, known in England as special constables, are also termed marshals in the United States. In some of the southern and western states of the Union the title marshal has sunk to that of the village policeman, as distinct from the county officers known as sheriffs and those of the justices' courts called constables.

In England the title of marshal, as applied to an executive officer is survied in the army, where the provost marshal is chief of the military police in large garrisons and in field forces. Office and title were borrowed from the French prévot des maréchaux, the modern equivalent of the medieval prepositus mariscalorum or guerrarm.

 MARSHALL, ALFRED (1842-1926), English economist, was born in London on the 26th of July 1842. He was educated at the Merchant Taylors' School and St John's College, Cambridge, being second wrangler in 1865, and in the same year becoming fellow of his college. He became principal of University College, Bristol, in 1877, and was lecturer and fellow of Balliol College, Oxford in 1883-1884. He was professor of political economy at Cambridge University from 1885 to 1908, and was a member of the Royal Commission on Labour in 1891. He became a fellow of the British Academy in 1902. He wrote (in conjunction with his wife) Economics of Industry (1870), whilst his Principles of Economics (1st ed. 1889) is a standard English text.

 MARSHALL, JOHN (1755-1835), American jurist, chief-justice of the U.S. Supreme Court, was born on the 24th of September 1755 at Germantown (now Midland), in what four years later became Fauquier county, Virginia. He was of English descent, the son of Thomas Marshall (1732-1806) and his wife Mary Isham Keith. Marshall served first as lieutenant and after July 1778 as captain in the Continental Army during the War of Independence. He resigned his commission early in 1781; was admitted to the bar after a brief course of study, first practised in Fauquier county; and after two years began to practise in Richmond. In 1786 we find him counsel in a case of great importance, Hite v. Fairfax, involving the original title of Lord Fairfax to that large tract of country between the headwaters of the Potomac and Rappahannock, known as the northern neck of Virginia. Marshall represented tenants of Lord Fairfax and won his case. From this time, as is shown by an examination of Call's Virginia Reports which cover the period, he maintained the leadership of the bar of Virginia. He was a member of the Virginia Assembly in 1782-1791 and again in 1795-1797; and in 1788, he took a leading part in the Virginia Convention called to act on the proposed constitution for the United States, with Madison, and urged the ratification of that instrument. In 1795 Washington offered him the attorney-generalship, and in 1796, after the retirement of James Monroe, the position of minister to France. Marshall declined both offers because his situation at the bar appeared to him "to be more independent and not less honourable than any other," and his "preference for it was decided." He spent the autumn and winter of 1797-1798 in France as one of the three commissioners appointed by President John Adams to adjust the differences between the young republic and the directory. The commission failed, but the course pursued by Marshall was approved in America, and with the resentment felt because of the way in which the commission had been treated in France, made him, on his return, exceedingly popular. To this popularity, as well as to the earnest advocacy of Patrick Henry, he owed his election as a Federalist to the National House of Representatives in the spring of 1799, through the feeling in Richmond was overwhelmingly in favour of the "Repub. in Congress" and was the deliberation in the great majority of cases that office in Congress was his speech on the case of Thomas Naab, alias Jonathan Robbins, in which he showed that there is nothing in the constitution of the United States which prevents the Federal government from carrying out an extradition treaty. He was secretary of state under President Adams from the 6th of June 1800 to the 4th of March 1801. In the meantime he had been appointed chief-justice of the Supreme Court, his commission bearing date the 31st of January. Thus while still secretary he presided as chief-justice.

At the time of Marshall's appointment it was generally considered that the Supreme Court was the one department of the new government which had failed in its purpose. John Jay, the first chief-justice, who had resigned in 1795, had just declined a reappointment to the chief-justice'ship on the ground that he had left the bench perfectly convinced that the court would never acquire proper weight and dignity, its organization being fatally defective. The advent of the new chief-justice was marked by a change in the conduct of business in the court. Since its organization, following the prevailing English custom, the judges had pronounced their opinions seriatim. But beginning with the December term 1801, the chief-justice became practically the sole mouthpiece of the court. For eleven years the opinions are almost exclusively his, and there are few recorded dissents. The change was admirably adapted to strengthen the power and dignity of the court. The chief-justice embodied the majesty of the judicial department of the government almost as fully as the president stood for the power of the executive. That this change was acquiesced in by his associates without diminishing their goodwill towards their new chief is testimony to the persuasive force of Marshall's personality; for his associates were not men of mediocre ability. After the advent of Mr Justice Joseph Story the practice was abandoned. Marshall, however, delived the opinions in the great majority of cases, and in practically all cases of any importance involving the interpretation of the Constitution. During the course of his judicial life his associates were as a rule men of learning and ability. During most of the time the majority were the appointees of
Democratic presidents, and before their elevation to the bench supposed to be out of sympathy with the federalistic ideas of the chief-justice. Yet in matters pertaining to constitutional construction, they seem to have had hardly any other function than to add the weight of their silent concurrence to the decision of their great chief. Thus the task of expounding the constitution during the most critical period of its history was his, and it was given to him to preside over the Supreme Court when it was called upon to decide four cases of vital importance: *Marbury v. Madison*, *McCulloch v. Maryland*, *Cohens v. Virginia* and *Gibbons v. Ogden*. In each of these cases it is Marshall who writes the opinion of the court; in each the continued existence of the peculiar Federal system established by the Constitution depended on the action of the court, and in each the court adopted a principle which is now generally perceived to be essential to the preservation of the United States as a federal state.

In *Marbury v. Madison*, which was decided two years after his elevation to the bench, he decided that it was the duty of the court to disregard any act of Congress, and, therefore, a fortiori any act of a legislature of one of the states, which the court thought contrary to the Federal Constitution.

In *McCulloch v. Maryland*, in spite of the contention of Jefferson and the then prevalent school of political thought that it was contrary to the Constitution for a person to bring one of the states of the United States, though only as an appellee, into a court of justice, he has declared that the power of the act of a state person who was convicted in a state court, to appeal to the Supreme Court of the United States, if he alleged that the state act under which he was convicted conflicted with the Federal Constitution or with an act of Congress.

In *McCulloch v. Maryland*, though admitting that the Federal government is one of delegated powers and cannot exercise any power not expressly given in the Constitution, he laid down the rule that Congress had a delegation of power, a delegate power, a wide latitude in the choice of means, not being confined in its choice of means to those which must be used if the power is to be exercised at all.

Lastly, in *Gibbons v. Ogden*, he held that when the power to regulate commerce among the several States was conferred by the Constitution on the Federal government, the word "commerce" included not only the exchange of commodities, but the means by which interstate and foreign intercourse was carried on, and therefore that Congress had the power to license vessels to carry goods and passengers between the states, and an act of one of the states making a regulation which interfered with such regulation of Congress was, *pro tanto*, of no effect. It will be seen that in the first two cases he established the Supreme Court as the final interpreter of the Constitution.

The decision in *McCulloch v. Maryland*, by leaving Congress unhampered in the choice of means to execute its delegated powers, made it possible for the Federal government to accomplish the ends of its mission, "Lay the foundation, end the evil" and Marshall, in course of his opinion, "let it be within the scope of the Constitution, and all means which are appropriate, which are plainly adapted to that end, which are not prohibited, but consist with the letter and spirit of the Constitution, are constitutional."

If the decision in *McCulloch v. Maryland* gave vigour to all Federal power, the decision in *Gibbons v. Ogden*, by giving the Federal government control over the means by which interstate and foreign commerce is carried on, preserved the material prosperity of the country. The decision recognizes what the framers of the Constitution recognized, namely that the United States is an economic union, and that business which is national should be under national, not state, control.

Though for the reasons stated, the four cases mentioned are the most important of his decisions, the value of his work as an exponent of the Constitution of the United States is not to be measured by these cases alone. In all he decided forty-four cases involving constitutional questions. Nearly every important part of the Constitution of the United States as it existed before the amendments which were adopted after the Civil War, is treated in one or more of them. The Constitution in its most important aspects is the Constitution as he interpreted it. He did not work out completely the position of the states in the Federal system, but he did grasp and establish the position of the Federal legislature and the Federal judiciary. To appreciate his work, however, it is necessary to see that it was the work not of a statesman but of a judge. Had Marshall been merely a far-seeing statesman, while most of his important cases would have been decided as he decided them, his lifetime would have been a failure. It was not only necessary that he should decide great constitutional questions properly, but also that the people of the United States should be convinced of the correctness of his interpretation of the Constitution. His opinions, therefore, had to carry to those who studied them a conviction that the constitution as written had been interpreted according to its evident meaning. They fulfilled this prime requisite. Their chief characteristic is the cumulative force of the argument. The ground for the premis is carefully prepared, the premis itself is clearly stated; nearly every possible objection is examined and answered; and then comes the conclusion. There is little or no repetition, but there is a wealth of illustration, a completeness of analysis, that convinces the reader, not only that the subject has been adequately treated, but that it has been exhausted. His style, reflecting his character, perfectly subjects the matter under simple. In the best sense of the word, his intellectual processes were so clear that he never doubted the correctness of the conclusion to which they led him. Apparently from his own point of view, he merely indicated the question at issue, and the inexorable rules of logic did the rest. Thus his opinions are simple, clear, dignified. Intensely interesting, the interest is in the argument, not in its expression. He had, in a wonderful degree, the power of phrase. He expressed important principles of law in language which tersely yet clearly conveyed his exact meaning. Not only is the Constitution interpreted largely as he taught the people of the United States to interpret it, but when they wish to express important constitutional principles which he enunciated they use his exact words. Again, his opinions show that he adhered closely to the words of the Constitution; indeed no one who has attempted to expand that instrument has confined himself more strictly to an examination of the text. In the proper, though not in the historical, sense he was the strictest of strict constructionists, and as a result his opinions are practically devoid of theories of government, sovereignty and the rights of man.

A single illustration of his avoidance of all theory and his adherence to the words of the Constitution will suffice. In the case of the United States v. Fisher the constitutional question involved was the power of Congress to give to the United States a preference over all other creditors in the distribution of the assets of a bankrupt. Such an act can be upheld on the ground that all governments have necessarily the right to give themselves priority. Not so Marshall. To give the United States a preference on any ground would make the theory of the innate nature of the government, national or otherwise, but as a reasonable means of carrying out one of the express powers conferred by the Constitution on the Federal government. Thus, he held that an act in question bearing the power expressly conferred on the Federal government to pay the debts of the union, and as a necessary consequence of this power the right to make remittances by bills or otherwise and to take precautions which will render the transactions safe.

It is important to emphasize the fact that Marshall adhered in his opinions to the Constitution as written, not only because it is a fact which must be recognized if we are to understand the correct value of his work in the field of constitutional law, but also because there exists to-day a popular impression that no implication is too great to stretch to his utmost the powers of the Federal government. This impression is due to all the ignorance of many of those who have undertaken to praise him. During his life he was charged by followers of the States Rights School of political thought with upholding Federal power in cases not warranted by the constitution. Later, however, those who admired a strong national government, without taking the trouble to ascertain whether the old criticism by members of the States Rights Party was just, regarded the assumption on which it was founded as Marshall's best claim to country's gratitude.

As a constitutional lawyer, Marshall stands without a rival. His work on international law and admiralty is of first rank. But though a good, he was not a great, common law or equity lawyer. In these fields he did not make new law nor clarify what was obscure, and his constitutional opinions which to-day are found least satisfactory are those in which the question to be solved necessarily involves the discussion of some common-law
conception, especially those cases in which he was required to construe the restriction imposed by the Constitution on any state impairing the obligation of contracts. His decision in the celebrated case of Dartmouth College v. Woodward, in which he held that a state could not repeal a charter of a private corporation, because a charter is a contract which a subsequent act of the state repealing the charter impairs, though of great economic importance, does not touch any fundamental question of constitutional law. The argument which he advances lacks the clearness and finality for which most of his opinions are celebrated. It is not certain with whom he thought the contract was made: with the corporation created by the charter, with the trustees of the corporation, or with those who had contributed money to its objects.

Of the wonderful persuasive force of Marshall's personality there is abundant evidence. His influence over his associates, already referred to, is but one example through a most impressive one. From the moment he delivered the opinion in Marbury v. Madison the legal profession knew that he was a great judge. Each year added to his reputation and made for a better appreciation of his qualities. The bar of the Supreme Court during his chief-justicehip was the most brilliant which the United States has ever known. Leaders, not only of legal, but political thought were among its members; one, Webster, was a man of genius and commanding position. To a very great degree Marshall impressed on the members of this bar and on the profession generally his own ideas of the correct interpretation of the Constitution and his own love for the union. He did this, not merely by his arguments but by the influence which was his by right of his strong, sweet nature. Statesmen and politicians, great and small, were at this time, almost without exception, members of the bar. To influence the political thought of the bar was to a great extent to influence the political thought of the people.

In 1782 he married Mary Willis Ambler, the daughter of the then treasurer of Virginia. They had ten children, six of whom grew to full age. For the greater part of the forty-eight years of their married life Mrs Marshall suffered intensely from a nervous affliction. Her condition called out the love and sympathy of her husband's deep and affectionate nature. June 1834, she used to tell her friends, "That day was his highest glory, was the purity, affectionateness, liberality and devotedness of his domestic life." For the first thirty years of his chief-justiceship his life was a singularly happy one. He never had to remain in Washington for more than three months. During the rest of the year, with the exception of a visit to Raleigh, which his duties as circuit judge required him to make, and a visit to his old home in Fauquier county, he lived in Richmond. His house on Shockhoe Hill is still standing.

On Christmas Day 1831 his wife died. He never was quite the same again. On returning from Washington in the spring of 1835 he suffered severe contusions, from an accident to the stage coach in which he was riding. His health, which had not been good, now rapidly declined and in June he returned to Philadelphia for medical attendance. There he died on the 6th of July. His body, which was taken to Richmond, lies in Shockoe Hill Cemetery under a plain marble slab, on which is a simple inscription written by himself. In addition to his opinions, Marshall wrote a number of essays on George Washington (5 vols., 1804-1807; 2d ed., 2 vols., 1832), which though prepared hastily contains much material of value.

The principal sources of information are: an essay by James B. Thayer (Boston and New York, 1904); Great American Lawyers (Philadelphia, 1908), ii, 313-408, an essay by Wm. Draper Lewis; and Allan B. Magruder, John Marshall (Boston, 1885), in the "American Statesmen Series." The addresses delivered on Marshall Day, the 4th of July, 1901, are collected by John P. Dillon (Chicago, 1903). In the "Appendix" to Dillon's collection will be found the "Discourse" by Joseph Story and the "Eulogy" by Horace Binney, both delivered soon after Marshall's death. For a study of Marshall's decisions, the Constitutional Decisions of John Marshall, edited by Joseph P. Collon, Jr. (New York and London, 1906), is of value.

(MARSHALL) John (1818-1891), British surgeon and physiologist, was born at Ely, on the 11th of September 1818, his father being a lawyer of that city. He entered University College, London, in 1838, and in 1847 he was appointed assistant-surgeon at the hospital, becoming in 1866 surgeon and professor of surgery. He was professor of anatomy at the Royal Academy from 1873 till his death. In 1883 he was president of the College of Surgeons, also Bradshaw lecturer on "Nerve-stretching for the relief or cure of pain"). Hunterian orator in 1885, and Morton lecturer in 1886. In 1867 he published his well-known textbook The Outlines of Physiology in two volumes.

He died on the 1st of January 1891. "Marshall's fame," wrote Sir W. MacCormac in his volume on the Centenary of the College of Surgeons (1900), "rests on the great ability with which he taught anatomy in relation to art, on the introduction into modern surgery of the galvano-cautery, and on the operation for the excision of varicose veins. He was one of the first to show that cholera might be spread by means of drinking water, and issued a report on the outbreak of cholera in Broad Street, St James's, 1854. He also invented the system of circular wards for hospitals, and to him are largely owing the details of the modern medical system of London hospitals.

MARSHALL, Stephen (c. 1594-1659), English Nonconformist divine, was born at Hadham in Huntingdonshire, and was educated at Emmanuel College, Cambridge (M.A. 1622, B.D. 1629). After holding the living of Wethersfield in Essex he became vicar of Finchingfield in the same county, and in 1636 was reported for "want of conformity." He was a preacher of great power, and influenced the elections for the Short Parliament of 1640. Clarendon esteemed his influence on the parliamentary side greater than that of Laud on the royalist. In 1642 he was appointed lecturer at St Margaret's, Westminster, and delivered a series of addresses to the Commons in which he advocated episcopal and liturgical reform. He had a share in writing Smectymnuus, which was appointed chaplain to the Earl of Essex's regiment in 1642, and a member of the Westminster Assembly in 1643. He represented the English Parliament in Scotland in 1643, and attended the parliamentary commissions at the Uxbridge Conference in 1645. He waited on Archbishop Laud before his execution, and was chaplain to Charles I. At the House of Lords he was present at Carisbrook. A moderate and judicious Presbyterian, he prepared with others the "Shorter Catechism" in 1647, and was one of the "Triers," 1648. He died in November 1655 and was buried in Westminster Abbey, but his body was exhumed and maltreated at the Restoration. His sermons, especially that on the death of John Pym in 1643, reveal eloquence and fervour. The only "systematic" work he published was A Defence of Infant Baptism, against John Tombs (London, 1646).

MARSHALL, a city and the county-seat of Saline county, Missouri, U.S.A., situated a little W. of the centre of the state, near the Salt Fork of the La Mine River. Pop. (1890), 4297; (1900), 5086 (208 being foreign-born and 98 negroes); (1910) 4899. It is served by the Missouri Pacific and the Chicago & Alton railways. The city is laid out regularly on a high, undulating prairie. It is the seat of Missouri Valley College (opened 1889; coeducational), which was established by the Cumberland Presbyterian church, and includes a preparatory department and a conservatory of music. The court-house (1883), a Roman Catholic convent and a high school (1897) are the principal buildings. The Missouri colony for the feeble-minded and epileptic (1899) is at Marshall. The principal trade is with the surrounding farming country. The municipality owns and operates the waterworks. Marshall was first settled and was made the county seat in 1830; it became a town in 1866 (re-incorporated 1870) and a city in 1878.

MARSHALL, a city and the county-seat of Harrison county, Texas, U.S.A., about 145 m. E. by S. of Dallas. Pop. (1890), 7207; (1900) 7855 (3769 negroes); (1910) 11,452. Marshall is served by the Texas & Pacific and the Marshall & East Texas railways, which have large shops here. Wiley University was
founded in 1873 by the Freedman's Aid Society of the Methodist Episcopal Church, and Bishop College, was founded in 1881 by the American Baptist Home Mission Society and incorporated in 1885. Marshall is situated in a region growing cotton and Indian corn, vegetables, small fruits and sugar-cane; in the surrounding country there are valuable forests of pine, oak and gum. In the vicinity of the city there are several lakes (including Caddo Lake) and springs (including Hynson and Rosborough springs). The city has a cotton compress, and among its manufactures are cotton-seed oil, lumber, ice, foundry products and canned goods. The municipality owns and operates the waterworks. Marshall was first settled in 1842, was incorporated in 1843, and received a city charter in 1848; in 1909 it adopted the commission form of government.

MARSHALL ISLANDS, an island group in the western Pacific Ocean (Micronesia) belonging to Germany. The group consists of a number of atolls ranging in size from small to large. The atolls are composed of coral formed by the remains of minute animals and plants. The atolls are typically ring-shaped, with a central lagoon and a reef surrounding it. The highest point on the atolls is usually between 40 and 50 feet above sea level. The climate is tropical, with high temperatures and humidity throughout the year. The vegetation is dominated by coconut palms, pandanus, and other tropical plants.

The Marshall Islands have a rich history, dating back to prehistoric times when the Polynesians first settled in the area. The islands were later inhabited by Micronesians, who developed a complex culture and trading network.

The islands were annexed by Germany in 1899 and became a mandated territory under League of Nations administration in 1922. In 1947, the Marshall Islands were granted internal self-government and became a United Nations Trust Territory in 1946. In 1979, they gained independence as the Federated States of Micronesia.

There are numerous islands in the group, with a total land area of approximately 74 square kilometers. The population is estimated to be around 20,000 people, with a dense urban population in Majuro, the capital and largest city.

The economy of the Marshall Islands is based on fishing, tourism, and the sale of fishing rights to other countries. The islands also have a small industry sector, primarily focused on lumber and handicrafts.
MARSHMAN—MARSIGL

MARS, an ancient people of Italy, whose chief centre was Marruvium, on the eastern shore of Lake Fucinus. They are first mentioned as members of a confederacy with the Vestini, Paeligni and Marrucini (Liv. viii. 29, cf. viii. 6, and Polyb. ii. 24, 12). They joined the Samnite同盟 in 306 B.C. (Liv. ix. 41), and on their submission became allies of Rome in 304 B.C. (Liv. ix. 45). After a short-lived revolt two years later, for which they were punished by loss of territory (Liv. x. 3), they were readmitted to the Roman alliance and remained faithful down to the social war, their contingent (e.g. Liv. xiv. 46) being always regarded as the flower of the Italian forces (e.g. Hor. Od. ii. 20, 18). In this war, which, owing to the prominence of the Marsian rebels is often known as the Marsic War, they fought bravely against odds under their leader Q. Pompaedius Silo, and, though they were frequently defeated, the result of the war was the enfranchisement of the allies (see *Rome: History*, "The Republic"). The Marsi were a hardy mountain people, famed for their simple habits and indomitable courage. It was said that the Romans had never triumphed over them or without them (Appian). They were also renowned for their magicians, who had strange remedies for various diseases.

The Latin colony of Alba Fucens near the north-west corner of the lake was founded in the adjoining Aequian territory in 303, so that from the beginning of the 3rd century the Marsians were in touch with a Latin-speaking community, to say nothing of the Latin colony of Carsioli (298 B.C.) farther west. The earliest pure Latin inscriptions of the district seem to be *C.I.L.* ix. 3874 and 3878 from the neighbourhood of Sipunum; it's character generally is of the Gracchan period, though it might be somewhat earlier.

Mommsen (*Unteritalische Dialekten*, p. 345) pointed out that in the social war all the coins of Pompaedius Silo have the Latin legend "Italia," while the other leaders in all but one case used *Oscan.*

The chief record of the dialect or patois we owe to the goddess Angitia, whose chief temple and grove stood at the south-west corner of Lake Fucinus, near the inlet to the *emissaria* of Claudianus (resided by Prince Toltonia), and the modern village of Lucu. She (or they, for the name is in the plural in the Latin inscription next cited) was widely worshipped in the central highlands (Salmo, *C.I.L.* ix. 3074, Furto in Venetorium, ibid. 3515) as a goddess of healing, especially skilled to cure snake bites by charms and the herbs of the Marsian woods. Her worshippers naturally practised the same arts—as their descendants do (see A. de Nino's charming collection of *Usci et costume abrausati*), their country being in Rome counted the home of witchcraft; see *Hor. Sat.* 1, 9, 29, *Epod.* 17, 28, &c.

The earliest local inscriptions date from about 300 to 150 B.C. and include the interesting and difficult bronze of Lake Fucinus, which seems to record a votive offering to Angitia, if *A(n)ctic* is as probable, was the local form of her name. Their language differs very slightly from Roman Latin of that date; for apparently contracted forms like *Pougno* instead of *Fucino* may really only be a matter of spelling. In final syllables the diphthongs *ai*, *ei*, *oi* all appear as *ë*. On the other hand, the older form of the name of the tribe (dat. plur. *Martes* = *Lat. Martis*) shows its derivation and exhibits the assimilation of *-to* into *-to*—proper to many Oscan dialects (*see Osca Lingua*) but strange to classical Latin.

See R. S. Conway, *The Italic Dialects*, pp. 290 sqq. (from which some portions of this article are taken by permission of the publishers of the Camb. Univ. Press); on the Fucino-Bronze, ib. p. 294. (R. S. C.)

MARSIGL [Latinized Marsilius], LUIGI FERDINANDO, COUNT (1658–1730), Italian soldier and scientific writer, was born at Bologna on the 10th of July 1658. After a course of scientific studies in his native city he travelled through Turkey collecting data on the military organization of that empire, as well as on its natural history. On his return he entered the service of the emperor Leopold (1682) and fought with distinction against the Turks, by whom he was wounded and captured in an
MARSILIO OF PADUA

action on the river Raab, and sold to a pasha whom he accompanied to the siege of Vienna. His release was purchased in 1684, and he then took part in the war of the Spanish succession. In 1703 he was appointed second in command under Count Arco in the defense of Alt-Breisach. The fortress surrendered to the duke of Burgundy, and both Arco and Marsigli were court martialed; the former was condemned to death and the latter cashiered, although acquitted of blame by public opinion. Having thus been forced to give up soldiering, he devoted the rest of his life to scientific investigations, in the pursuit of which he made many journeys through Europe, spending a considerable time at Marseilles to study the nature of the sea. In 1712 he presented his collections to his native city, where they formed the nucleus of the Bologna Institute of Science and Art. He died at Bologna on the 1st of November 1730. Marsigli was a fellow of the London Royal Society and a member of the Paris Academy of Science.

BIBLIOGRAPHY.—A list of his works, over twenty in number, is given in Niceron’s *Memoriae*; his *Breve ritratto del signor Marsilio de l’Alberghieri* alla storia del mare was published at Venice in 1711, and again at Amsterdam (in French) in 1725; the *Stato militare dell’impero ottomano* was published at Amsterdam and the Hague in Italian and French, respectively (1694); the *Della storia dei dogmi* (1681) and the *Danubius pannonico-mysticus*, a large work in six volumes containing much valuable historic and scientific information on the Danubian countries, at the Hague (1725). See Fontenelle, "Essai historique sur la vie de Marsigli" (1730); Quinney, *Memoires sur la vie de M. le comte Marsigli* (Zurich, 1741), and Fantuzzi’s biography of Marsigli (Bologna, 1770).

MARSILIO OF PADUA [MARSIGLIO MARINARDINO] (1270–1342), Italian medieval scholar, was born at Padua, and at first studied medicine in his own country. After practising various professions, among others that of a soldier, he went to Paris about 1311. The reputation which he had gained in the physical sciences soon caused him to be raised to the position of rector of the university (for the first term of the year 1313). While still practising medicine he entered into relations with another master of Paris, the philosopher John of Jandun, who collaborated with him in the composition of the famous *Defensor pacis* (1324), one of the most extraordinary political and religious works which appeared during the 14th century. The violent struggle had just broken out between pope John XXII and Louis of Bavaria, king of the Romans, and the latter, on being excommunicated and called upon to give up the empire, only replied to the pope’s threats with fresh provocations. Marsilius of Padua and John of Jandun, though they had both reason to be grateful for the benefits of John XXII, chose this moment to demonstrate, by plausible arguments, the supremacy of the Empire, its independence of the Holy See, and the emptiness of the prerogatives “usurped” by the sovereign pontiffs—a demonstration naturally calculated to give them a claim on the gratitude of the German sovereign.

The *Defensor pacis*, as its name implies, is a work intended to restore peace, as the most indispensable benefit of human society. The author of the law is the people, i.e. the whole body, or at least the most important part (valensior) of the citizens; the people should themselves elect, or at least appoint, the head of the government, who, lest he should be tempted to put himself above the bounds of his office, should have at his disposal only a limited armed force. This chief is responsible to the people for the breaches of the law, and in serious cases they can condemn him to death. The real cause of the trouble which prevails among men is the papacy, a “fictitious” power, the development of which is the result of a series of usurpations. Marsilius denies, not only to the pope, but to the bishops and clergy, any coercive jurisdiction or any right to pronounce on their own authority excommunications and interdicts, or in any way to impose the observance of the divine law. He is not opposed to penalties against heretics, but he would have them pronounced only by civil tribunals. Desiring to see the clergy practise a holy poverty, he proposes the suppression of tithes and the seizure by the secular power of the greater part of the property of the church. The clergy, thus deprived of its wealth, privileges and jurisdiction, is further to be deprived of independence, for the civil supreme power is to have the right of appointing to benefices, &c. The supreme authority in the church is to be the council, but a council summoned by the emperor. The pope, no longer possessing any more power than other bishops (though Marsilius recognizes that the supremacy of the Church of Rome goes back to the earliest times of Christianity), is to content himself with a pre-eminence mainly of an honorary kind, without claiming to interpret the Holy Scriptures, define dogmas or distribute benefices; moreover, he is to be elected by the Christian people, or by the delegates of the people, i.e. the princes, or by the council, and these are also to have the power to punish, suspend or depose him. Such is this famous work, full of obscurities, redundancies and contradictions, in which the thread of the argument is sometimes lost in a labyrinth of reasonings and citations, both sacred and profane, but which nevertheless expresses, both in religion and politics, such audacious and novel ideas that it is possible to trace in it, as it were, a rough sketch of the doctrines developed during the periods of the Reformation and of the French Revolution. The theory was purely democratic, but was all ready to be transformed, by means of the teachings of another, but an imperialist, doctrine; and in like manner it contained a visionary plan of reformation which ended, not in the separation of the church from the state, but in the subjection of the church to the state. To overthrow the ecclesiastical hierarchy, to deprive the clergy of all their privileges, to reduce the pope to the rank of a kind of president of a Christian republic, which governs itself, or rather submits to the government of Caesar—such is the dream formed in 1324 by two masters of the university of Paris.

When in 1326 Louis of Bavaria saw the arrival in Nuremberg of the two authors of the book dedicated to him, startled by the boldness of their political and religious theories, he was at first inclined to treat them as heretics. He soon changed his mind, however, and, admitting them to the circle of his intimates, loaded them with favours. Having become one of the chief inspirers of the imperial policy, Marsilius accompanied Louis of Bavaria to Italy, where he preached or circulated written attacks against the pope, especially at Milan, and where he came within the sight of the realization of his wildest utopias. To see a king of the Romans crowned emperor at Rome, not by the pope, but by those who claimed to be the delegates of the people (Jan. 17, 1328), to see John XXII deposed by the head of the Empire (April 18), and a mendicant friar, Pietro de Corbara, raised by an imperial decree to the throne of St Peter (as Nicholas V.) after a sham of a popular election (May 12), all this was merely the application of principles laid down in the *Defensor pacis*. The two authors of this book played a most active part in the Roman Revolution. Marsilius, appointed imperial vicar, abused his power to persecute the clergy who had remained faithful to John XXII, in recompense for his services, he seems to have been appointed archbishop of Milan, while his collaborator, John of Jandun, obtained from Louis of Bavaria the bishopric of Ferrara.

Marsilius of Padua also composed a treatise *De translatione imperii romanii*, which is merely a rearrangement of a work of Landolfo Colonna, *De jurisdictione imperatoris in causa matrimonii*, intended to prove the exclusion of the pope in matrimonial affairs, or rather, to justify the intervention of Louis of Bavaria, who, in the interests of his policy, had just annulled the marriage of the son of the king of Bohemia and the countess of Tirol. But, above all, in an unpublished work preserved at Oxford, the *Defensor minor*, Marsilius completed and elaborated in a curious manner certain points in the doctrine laid down in the *Defensor pacis*. In it he deals with ecclesiastical jurisdiction, penances, indulgences, crusades and pilgrimages, vows, excommunication, the pope and the council, marriage and divorce. Here his democratic theory is more clearly leads up to a proclamation of the imperial omnipotence.

Marsilius of Padua does not seem to have lived long after 1342. But the scandal provoked by his *Defensor pacis*, condemned by the court of Avignon in 1326, lasted much longer. Benedict XII and Clement VI censured it in turn; Louis of Bavaria
MARSIVAN—MARSTON, J.

disowned it. Translated into French, then into Italian (14th century) and into English (16th century), it was known by Wycliffe and Luther, and was not without an influence on the Reform movement.

There are numerous manuscripts of the Defensor pacis extant. We will here mention only one edition, that given by Golzat, in 1614, in vol. i. of his Monarchia sacri imperii; an unpublished last chapter was published by Karl Müller, in 1883, in the Göttingische gelehrte Anzeigen, pp. 923–925.

Count Lützow in The Life and Times of Master John Huis (London and New York, 1909), pp. 5–9, gives a good abstract of the Defensor pacis and the relations of Marsilius to other precursors of the Reformation.

MARSIVAN, or MERZIETZ (anc. Phasemon), a town in the Amasia sanjak of the Sivas vilayet of Asia Minor, situated at the foot of the Tavshén Dagh. Pop. about 20,000, two-thirds Mussulman.

It is a centre of a American missionary and educational enterprise, and the seat of Anatolia College, a theological seminary, and schools which were partly destroyed in the anti-Armenian riots of 1903 and 1895. There is also a Jesuit school. Marsivan is an unusually European place both in its aspect and the commodities procurable in the bazaar.

MARS-LA-TOUR, a village of Lorraine, between Metz and the French frontier, which formed part of the battlefield of the 16th of August 1870. The battle is often called the battle of Mars-la-Tour, though it is more usually named after Vionville. (See Metz; and Franco-German War.) At Mars-la-Tour occurred the destruction of the German 38th brigade.

MARSTON, JOHN (c. 1575–1634), English dramatist and satirist, eldest son of John Marston of Coventry, at one time lecturer of the Middle Temple, was born in 1575, or early in 1576. Swinburne notes his affinities with Italian literature, which may be partially explained by his parentage, for his mother was the daughter of an Italian physician, Andrew Guarisi. He entered Brasenose College, Oxford, in 1592, taking his B.A. degree in 1594. The elder Marston in his will expresses regret that his son, to whom he left his law-books and the furniture of his rooms in the Temple, had not been willing to follow his profession. John Marston married Mary Wilkes, daughter of one of the royal chaplains, and Ben Jonson said that “Marston wrote his father-in-law’s preachings and his father-in-law’s sermons.” His first work was The Metamorphosis of Pigmalions Image, and certaine Satyres (1598). "Pigmalion" is an erotic poem in the metre of Venus and Adonis, and Joseph Hall attacked a rather clumsy epigram to every copy that was exposed for sale in Cambridge. In the same year Marston published, under the pseudonym of W. Kinsayer, already employed in the earlier volume, his Scourge of Villaine, eleven satires, in the sixth of which he asserted that Pigmalion was intended to parody the amorous poetry of the time. Both this volume and its predecessors were burnt by order of the archbishop of Canterbury. The satires, in which Marston avowedly took Persius as his model, are coarse and vigorous. In addition to a general attack on the vices of his age he avenges himself on Joseph Hall who had assailed him in Virgidiæna. He had a great reputation among his contemporaries. John Weever couples his name with Ben Jonson’s in an epigram; Francis Meres in Palladis tamia (1608) mentions him among the satirists; a long passage is devoted to “Monsieur Kinsayer” in the Return from Parnassus (1606), and Dr Brinsley Nicholson has suggested that Furor poeticus in that piece may be a satirical portrait of him. But his invective by its general tone, goes far to justify Mr W. J. Courthope’s judgment that “it is likely enough that in seeming to satirise the world without him, he is usually holding up the mirror to his own prurient mind.”

On the 28th of September 1599 Henslowe notes in his diary that he lent “unto Mr Maxton, the new poete, the sume of forty shillinges, as an advance on a play which is not named.” Another

1 Hist. of Eng. Poetry, iii. 70.

hand has amended “Maxton” to “Mastone.” The earliest plays to which Marston’s name is attached are The History of Antonio and Melida, The First Part; and Antonio’s Revenge, The Second Part (both entered at Stationers’ Hall in 1601 and printed 1602). The second part is preceded by a prologue which, in its gloomy forecast of the play, moved the admiration of Charles Lamb, who also compares the situation of Andrugio and Lucia to Lear and Kent, but the scene which he quotes gives a misleading idea of the play and of the general tenor of Marston’s work.

The melodrama and the exaggerated expression of these two plays offered an opportunity to Ben Jonson, who had already twice ridiculed Marston, and now pilloried him as Crispinus in The Poetaster (1601). The quarrel was patched up, for Marston dedicated his Malcontent (1604) to Jonson, and in the next year he prefixed commendatory verses to Sejanus. Far greater restraint is shown in The Malcontent than in the earlier plays. It was printed twice in 1604, the second time with additions by John Webster. The Dutch Courteesan (1605) and Parasitaster, or the Faune (1606) followed. In 1605 Eastward Hoe, a gay comedy of London life, which gave offence to the king’s Scottish subjects, was produced. The part played by Marston, Chapman and Jonson—to be imprisoned at the instance of Sir James Murray. The Wender of Women, or the Tragedie of Sophonisba (1606), seems to have been put forward by Marston as a model of what could be accomplished in tragedy. In the preface he mocks at those authors who make a parade of their authorities and their learning, and the next play, What you Will (printed 1607; but probably written much earlier), contains a further attack on Jonson. The tragedy of The Insatiate Countesse was printed in 1613, and again, this time anonymously, in 1616. It was not included in the collected edition of Marston’s plays in 1633, and in the Duke of Devonshire’s library there is a copy bearing the name of William Barkstead, the author of the poems, Myrrha, the Mother of Adonis (1607), and Hiren and the Fair Greek (1611). The piece contains many passages superior to anything to be found in Marston’s well-authenticated plays, and Mr A. H. Bullen suggests that it may be Barkstead’s version of an earlier one drafted by Marston. The character and history of Isabella are taken chiefly from “The Disordered Lyfe of the Countess of Celant” in WilliamPaynter’s Palace of Pleasure, derived eventually from Bandello. There is no certain evidence of Marston’s authorship in Histrionomastix (printed 1610, but probably produced before 1599), or in Jacke Drums Entertainiment, or the Comedie of Pasquill and Katherine (1610), though he probably had a hand in both. Mr R. Boyle (Englišche Studien, vol. xxx., 1901), in a critical study of Shakespeare’s Troilus and Cressida, assigns to Marston’s hand the whole of the action dealing with Hector, with the prologue and epilogue, and attributes to him the bombast and coarseness in the last scenes of the play. It will be seen that his undoubted dramatic work was completed in 1607. It is uncertain at what time he exchanged professions, but in 1616 he was presented to the living of Christchurch, Hampshire. He formally resigned his charge in 1631, and when his works were collected in 1633 the publisher, William Sheares, stated that the author “in his autumn and declining age” was living “far distant from this place.” Nevertheless he died in London, in the parish of Aldermary, on the 25th of June 1634. He was buried in the Temple Church.

Marston’s works were first published in 1633, once anonymously as Tragedies and Comedies, and then in the same year as Works of Mr John Marston. The Works of John Marston (3 vols.) were reprinted by Mr J. O. Halliwell (Phillipps) in 1886, and again by Mr. A. H. Bullen (3 vols.) in 1887. His Poems (2 vols.) were edited by Mr. H. Q. Croxton in 1909. The British Museum Catalogue tentatively assigns to Marston The WHisping of the Satyrie in a white sheet; or, the Boodle’s Confutation (1601), a pamphlet in answer to The Whisping of the Satyrie. For an account of the quarrel of Dekker and Marston with Ben Jonson see Dr R. A. Small, The

2 Revived at Drury Lane (1751) as The Prentices, in 1775 as Old City Manners, and said to have suggested Hogarth’s “Industrious and Idle Prentices.”

Aromstein in Englische Studien (vols. xx. and xxxi., 1895), and "Quellenstudie zu den Dramen Ben Jonsons, John Marston..." by Emil Koeppel (Münchener Beiträge zur roman. und engl. Philologie, pt. xi. 1895).

**MARSTON, PHILIP BOURKE** (1850–1887), English poet, was born in London on the 13th of August 1850. His father, **JOHN WESTLAND MARSTON** (1810–1890), of Lincolnshire origin, the friend of Dickens, Macready and Charles Kean, was the author of a series of metrical dramas which held the stage in succession to the ambitious efforts of John Tobin, Talfourd, Bulwer and Sheridan Knowles. • His chief plays were The Patriarch's Daughter (1841), Strathmore (1849), A Hard Struggle (1858) and Donna Diana (1863). He was looked up to as the upholder of the outworn tradition of the acted poetic drama, but his plays showed little vitality, and Marston's reviews for the Athenæum, including one of Swinburne's Atalanta in Calydon, and his dramatic criticisms embodied in Our Recent Actors (1888) will probably claim a more enduring reputation. His Dramatic and Poetical Works were collected in 1876. The son, Philip Bourke, was born in a literary atmosphere. His sponsors were Philip James Bailey and Dinah Mulock (Mrs Craik). At his father's house near Chalk Farm he met authors and actors of his father's generation, and subsequently the Rossettis, Swinburne, Arthur O'Shaughnessy and Irving. From his earliest years his literary precocity was overshadowed by misfortunes. In his fourth year, in part owing to an accident, his sight began to decay, and he gradually became almost totally blind. His mother died in 1870. His fiancé, Mary Nesbit, died in 1871; his closest friend, Oliver Madox Brown, in 1874; his sister Cicely, his amanuensis, in 1878; in 1879 his remaining sister, Eleanor, who was followed to the grave after a brief interval by her husband, the poet O'Shaughnessy, and her two children. In 1882 the death of his mother and poetic ally and inspirer, Rossetti, was followed closely by the tragedy of another kindred spirit, the sympathetic pessimist, James Thomson ("B. V.") who was carried dying from his blind friend's rooms, where he had sought refuge from his latest miseries early in June of the same year. It is said that Marston came to dread making new friendships, for fear of evil coming to the recipients of his affection. In the face of such calamities it is not surprising that Marston's verse became more and more sorrowful and melancholy. The idylls of flower-life, such as the early and very beautiful "The Rose and the Wind" were succeeded by dreams of sleep and the repose of death. These qualities and gradations of feeling, reflecting the poet's successive ideals of action and quiescence, are traceable through his three published collections, Songtide (1871), All in All (1873) and Wind Voices (1883). The first and third, containing his best work, went out of print, but Marston's verse was collected in 1882 by Mrs Louise Chandler Moulton, a loyal and devoted friend, and herself a poet, as Philip Marston read his poetry and of poetic values, especially of the intense order, his judgment could not be surpassed in sensitiveness. He was saturated with Rossetti and Swinburne, and his imitative power was remarkable. In his later years he endeavoured to make money by writing short stories in Home Chimes and other American magazines, through the agency of Mrs Chandler Moulton. His popularity in America far exceeded that in his own country. His health showed signs of collapse from 1883; in January 1887 he lost his voice, and suffered intensely from the failure to make himself understood. He died on the 13th of February 1887.

He was commemorated in Dr Gordon Hale's "Blind Boy," and in a fine sonnet by Swinburne, beginning "The days of a man are three-score years and ten." There is an intimate sketch of the blind poet by a friend, Mr Coulson Kernahan, in Sorrows and Songs (1887, p. 127).

**MARSTON MOOR, BATTLE OF,** was fought on the 2nd of July 1644 on a moor (now enclosed) seven miles west of York, between the Royalist army under Prince Rupert and the Parliamentary and Scottish armies under the earl of Manchester, Lord Fairfax and Lord Leven. For the operations that preceded the battle see GREAT REBELLION. Rupert had relieved York and joined forces with the marquess of Newcastle's army that had defended that city, and the Parliamentarians and Scots who had besieged it had drawn off south-westward followed by the Royalists. On the morning of the 2nd of July, however, Rupert's attack on their rearguard forced them to halt and deploy on rising ground on the south edge of the moor, their position being defined on the right and left by Long Marston and Tockwith and divided from the Royalist army on the moor by a lane connecting these two villages. The respective forces were—Royalists about 18,000, Parliamentarians and Scots about 27,000. The armies stood front to front. On the Royalist right was half the cavalry under Rupert; the infantry was in the centre in two lines and the left wing of cavalry was under General (Lord) Goring. The lane along the front was held by skirmishers. On the other side the cavalry of the Eastern Association under Lieut.-General Cromwell and that of the Scots under Major-General Leslie (Lord Newark) formed the left of the infantry of the Eastern Association under Major-General Crawford, of the Scots under Lord Leven, and of the centre and the Yorkshire cavalry under Sir Thomas Fairfax was on the right wing.

During the afternoon there was a desultory cannonade, but neither side advanced. At last, concluding from movements in the enemy's lines that there would be no fighting that day, Rupert and Newcastle strolled away to their coaches and their soldiers dismounted and lay down to rest. But seeing this Cromwell instantly advanced his wing to the attack (5 p.m.). His dragoons drove away the skirmishers along the lane, and the line cavalry crossed into the moor. The general forward movement spread along the Parliamentary line from left to right, the Eastern Association infantry being the first to cross the road. In Rupert's momentary absence, the surprised Royalist cavalry on their flank attacked the central regiment of Cromwell's charge, although the latter was only made piecemeal as each unit crossed the lane and formed to the front. Rupert soon galloped up with his fresh second line and drove back Cromwell's men, Cromwell himself being wounded, but Leslie and the Scots Cavalry, taking ground to their left, swung in upon Rupert's flank, and after a hard struggle the hitherto unscathed cavalry of the prince was broken and routed. Then, being unlike other cavalry of the time, a thoroughly disciplined force, the Eastern Association cavalry rallied, leaving the pursuit to the Scots light horse. On the Parliamentary right, Goring had swept away the Yorkshire horse, and although most of his troopers had followed in disorderly pursuit, Sir Charles Lucas with some squadrons was attacking the exposed right of Leven's infantry. At the same time the Parliamentary infantry had mostly crossed the lane and was fighting at close quarters and suffering severely. Newcastle's own country "White-Coat" brigades driving back and finally penetrating their centre. Lord Leven gave up the battle as lost and rode away to Tadcaster. But the Scots on the right of the foot held firm against Lucas's attacks, and Cromwell and Leslie with their cavalry passed along the rear of the Royal army, guided by Sir Thomas Fairfax (who though wounded in the rout of his Yorkshire horse had made his way to the other flank). Then, on the ground where Goring had routed Fairfax, Cromwell and Leslie won an easy victory over Goring's scattered and disordered horsemen. The Eastern Association infantry had followed the horse and was now in rear of the Royalists. The original Parliamentary centre of foot, a remnant, but one containing only the bravest and steadiest men, held fast, and soon the Royalist infantry was broken up into isolated regiments and surrounded by the victorious horse and foot of the enemy. The White-Coats retreated into an enclosure and there defended themselves to the last man. The rest were cut down on the field scattered in the pursuit and at nightfall the Royalist army had ceased to exist. Some of Rupert's foot regiments made their way to York, but the dispirited garrison only held out for a fortnight. Rupert rallied some six thousand of the men and escaped over the hills into Lancashire, thence rejoining King Charles in...
MARSUPIALIA

the south. But the Northern army, the main hope of the Royalist cause, was destroyed.

MARSUPIALIA (from Lat. marsupium, a "pouch," or "bag"), the group of mammals in which the young are usually carried for some time after birth in a pouch on the under-surface of the body of the female. The group, which has also the alternative title of Didelphia, is by some authorities regarded as a sub-class of the mammalia of equal rank with the Monotremata, while by others it is brigaded with the placentals, so that the two together form a sub-class of equal grade with the one represented by the monotremes. There is much to be urged in favour of either view; and in adopting the former alternative, it must be borne in mind that the difference between monotremes and marsupials is vastly greater than that which separates the latter from placentals. In elevating the marsupials to the rank of a sub-class the name Metatheria has been suggested as the title for the higher grade, with MARSUPIALIA as the designation for the single order by which they are now represented. It is, however, less liable to cause confusion, and in many other ways more convenient to employ the better known term Marsupialia in both senses.

Marsupials may be defined as the egg-laying (non-egg-laying) mammals, in which the young are born in an imperfect condition, and almost immediately attached to the teats of the mammary glands; the latter being generally enclosed in a pouch, and the front edge of the pelvis being always furnished with epipubic or "marsupial" bones. As a rule there is no allantoic placenta forming the means of communication between the blood of the parent and the foetus, and when such a structure does occur its development is incomplete. In all cases a more or less full series of teeth is developed, these being differentiated into incisors, canines, premolars and molars, when all are present; but only a single pair of teeth in each jaw has deciduous predecessors.

The pouch from which the marsupials take their name is supported by the two epipubic bones, but does not correspond to the temporary breeding-pouch of the monotremes. It may open either forward or backwards; and although present in the great majority of the species, and enclosing the teats, it may, as in many of the opossums, be completely absent, when the teats extend in two rows along the whole length of the under-surface of the body. Whether a pouch is present or not, the young are born in an exceedingly imperfect state of development, after a very short period of gestation, and are immediately transferred by the female parent to the teats, where they remain firmly attached for a considerable time; the milk being injected into their mouths at intervals by means of a special muscle which compresses the glands. In the case of the great grey kangaroo, for instance, the period of gestation is less than forty days, and the newly-born embryo, which is blind, naked, and unable to use its bud-like limbs, is little more than an inch in length.

As additional features of the subclass may be mentioned the absence of a corpus callosum connecting the right and left hemispheres of the brain, and of a fossa in the septum between the two auricles of the heart. In the skull there are always vacuities, or unossified spaces in the bones of the palate, while the "angle," or lower hind extremity of each half of the lower jaw is strongly bent inwardly, so that the body of the jaw forms a kind of shelf, and the alisphenoid bone takes a share in the formation of the tympanum, or auditory bladder, or bulla. Didelphia, the alternative name of the group was given in allusion to the circumstance that the uterus has two separate openings (stomata), whereas in the marsupials the alimentary canal and the urino-genital sinus in a common sphincter muscle, and the position of the scrotum in advance of the penis. The bandicoots alone possess a placenta. Lastly the number of trunk-vertebrae is always nineteen, while there are generally thirteen pairs of ribs.

As regards the teeth, in all cases except the wombats the number of upper incisors differs from that of the corresponding lower teeth. As already stated, there is no vertical displacement and succession of the teeth, except in the case of a single tooth on one side of each jaw, which is the third of the premolar series, and is preceded by a tooth having more or less of the characters of a molar (see fig. 1). In some cases (as in rat-kangaroos) this tooth retains its place and function until the animal has nearly, if not quite,

1 The presence or absence of the corpus callosum has been much disputed; the latest researches, however, indicate its absence.

attained its full stature, and is not shed and replaced by its successor until after all the other teeth, including the molars, are in place and use. In others, as the thylacine, it is rudimentary, being shed or absorbed before any of the other teeth have cut the gum, and therefore functionless. It may be added that there are some marsupials, such as the wombat, koala, marsupial ant-eater and the dasyures,

in which no such deciduous tooth, even in a rudimentary state, has been discovered. In addition to this replacement of a single pair of functional teeth in each jaw, it has been discovered that marsupials possess rudimentary tooth-germs which never cut the gum. According to one theory, these rudimentary teeth, together with the one pair of functional teeth in each jaw that has vertical successors, represent the milk- or placental dentition. On the other hand, there are those who believe that the functional dentition (other than the replacing premolar and the molars) correspond to the milk-dentition of placentals, and that the rudimentary tooth-germs represent a "pre-leaf" dentition. The question, however, is of academic rather than of practical interest, and whichever way it is answered does not affect our general conception of the nature and relationships of the group.

Unfortunately the homology of the functional series does not by any means end the uncertainty connected with the marsupial dentition; as there is also a difference of opinion with regard to the serial homology of some of the cheek-teeth. For instance, according to the older view, the dental formula in the thylacine or Tasmanian wolf is 5-6.5; in the present writer, this formula, so far as the cheek-teeth are concerned, should be altered to p. 4, m. 3, n. 3, f. 3, thus bringing it in accord, so far as these teeth are concerned, with the placental formula, and making the single pair of replacing teeth the third premolars. It may be added that the formula given above shows that the marsupial dentition may comprise more teeth than the 44 which form the normal full placental complement.

As regards geographical distribution, existing marsupials, with the exception of two families, Didelphidae and Euphylidae, are mainly limited to the Australian region, forming the chief mammalian fauna of Australia, New Guinea, and some of the adjacent islands. The Didelphidae are almost exclusively Central and South American, only one or two species ranging into North America. Fossil remains of members of this family have also been found in Europe in strata of the Oligocene period.

History.—The origin and evolution of the Australian marsupials have been discussed by Mr. B. A. Bensley. In broad contrast to the views of Dr. A. R. Wallace, this author is of opinion that marsupials did not enter Australia until the middle of the Tertiary period, their predecessors being probably opossums of the American type. They were then arboreal; but they speedily entered upon a rapid, although short-lived, course of evolution, during which leaping terrestrial forms like the kangaroos were developed. The short period of this evolution is at least one factor in the primitive grade of even the most specialized members of the group. In the advance of their molar teeth from a tritubercular to a grinding type, the author traces a curious parallelism between marsupials and placentals. Taking opossums to have been the ancestors of the group, the author considers the present writer may be right in his view that marsupials entered Australia from Asia by way of New Guinea. On the other hand there is nothing absolutely decisive against their origin being southern.

Again, taking as a text Mr. L. Dollo's view that marsupials were originally arboreal, that, on account of their foot-structure, they could not have been the ancestors of placentals, and that they themselves are degenerate placentals, Mr. Bensley contrasts this with Huxley's scheme of mammalian evolution. According
to the latter, the early monotremes which became specialized into modern monotremes, gave rise to the ancestors of the modern marsupials; while the modern placentals are likewise offshoot from the ancestral marsupial stock. This phylogeny, the author thinks, is the most probable of all. It is urged that the imperfect placenta of the bandicoots instead of being vestigial, may be an instance of parallelism, and that in marsupials generally the allantois failed to form a placental connexion. Owing to the antiquity of both placentals and marsupials, the arboreal character of the feet of the modern forms of the latter is of little importance. Further, it is considered that too much weight has been assigned to the characters distinguishing monotremes from other mammals, foetal marsupials showing a monotreme type of coracid, while it is probable that in the long run it will be found impossible to maintain the essential dissimilarity between the milk-glands of monotremes and other mammals.

Another view is to regard both marsupials and placentals as deriving from implacental ancestors more or less nearly related to the creodont carnivora, or possibly as independently descended from anomodont reptiles (see CREODONTA). Finally, there is the hypothesis that marsupials are the descendants of placentals, in which case, as was suggested by its discoverer, the placent of the bandicoots would be a true vestigial structure.

Classification.

Existing marsupials may be divided into three main divisions or sub-orders, of which the first, or Polyprotodontia, is common to America and Austrasias; the second, or Paucituberculata, is exclusively South American; while the third, or Diprotodonts, is as solely Australasian inclusive of a few in the eastern Austro-Malayan islands.

1. Polyprotodontia.—The Polyprotodonts are characterized by their numerous, small, sub-equal incisors, of which there are either five or four pairs in the upper and always three in the lower jaw, (fig. 2) and the generally strong and large canines, as well as by the presence of from four to five sharp cusps or tubercles on the crown of the molars. The pouch is often absent, and may open backwards. For the most part the species are carnivorous or insectivorous.

The first family is that of the true or American opossums—Didelphyidae, in which there are five pairs of upper incisors, while the feet are of the presumed primitive arboreal type, the hind foot having the four outer toes sub-equal and separate, with the first opposable to them all. With the exception of the water-opossum, forming the genus Chironectes, all the living members of the family may be included in the genus Didelphys. The latter may, however, be split up into several sub-generic groups, such as Metachirus, Philander, Marmosa (Micosurus or Procyonos), Peramys, Dryomys, etc. The small South American forms included in Marmosa, which lack the pouch, and have numerous teats, and molar teeth of a primitive type, are doubtless the most generalized representatives of the group (see Opossum and WATER-OPOSSUM).

Nearly allied is the Australian family Dasyuridae, characterized by the presence of only four pairs of upper incisors, the generally small and rudimentary condition of the first hind toe, which can but seldom be opposed to the rest, and the absence of prehensile power in the tail; the pouch being either present or absent, and the fore feet always five-toed. The stomach is simple, and there is no caecum to the intestine, although this is present in the opossums.

The largest representative of the family is the Tasmanian wolf, or thylacine, alone representing the genus Thylacinus, in which the dentition numbers i, c, p, m. 46; with the incisors small and vertical, the outer one in the upper jaw being larger than the others. Summits of the lower incisors, before they are worn, with a deep transverse groove, dividing it into an anterior and a posterior cusp. Canines long, strong and conical. Premolars with compressed crowns, increasing in size from before backwards. Molars in general characters resembling those of Sarcophilus, but of more simple form, the cusps being less distinct and not so sharply pointed. Deciduous molar very small, and shed before the animal leaves the mother's pouch. General form dog-like, with the head elongated, the muzzle pointed, and the ears moderate, erect and triangular. Fur short and closely applied to the skin. Tail of moderate length, thick at the base and tapering towards the apex, clothed with short hair. First hind toe (including the metacarpal bone) absent. Vertebræ: C. 7, D. 13, L. 6, S. 2, Ca. 23. Marsupial bones ossified. The gradual passage of the root of the tail into the body is a character common to the Tasmanian wolf and the aard-wark, and may be directly inherited from reptilian ancestors (see THYLACINE).

The next genus is represented solely by the Tasmanian devil, Sarcophilus (or Dacculus) orus, a medium-sized animal with a dental formula similar to that of the dasyures, but with teeth (fig. 2), approximating to those of the thylacine, though markedly different in details. The first hind toe is absent.

In the "native cats," or dasyures, constituting the genus Dasyurus, the dental formula is i, c, p, m. total 42. The upper incisors are nearly equal and vertical, with the first slightly longer, narrower, and separated from the rest. Lower incisors sloping forward and upward. Canines large and sharply pointed. First two premolars with compressed and sharp-pointed crowns, and slightly developed anterior and posterior accessory basal cusps. Molars with numerous sharp-pointed cusps. In the upper jaw the first two with crowns having a triangular free surface; the last small, simple, narrow and placed transversely. In the lower jaw the canines more compressed, with longer cusps; the last not notably smaller than the others. Ears of moderate size, prominent and obtusely pointed. First hind toe rudimentary, clawless or absent; its metatarsal bone always present. Tail generally long and well clothed with hair. Vertebræ: C. 7, D. 13, L. 6, S. 2, Ca. 18-20 (see DASYURE).

The genus Phascologale comprises a number of small marsupials, none exceeding a rat in size, differing from the dasyures in possessing an additional premolar—the dentition being i, c, p, m. total 46—and in having the teeth generally developed upon an insectivorous rather than a carnivorous pattern, the upper middle incisors being larger and inclined forward, the canines relatively smaller, and the molars two-rooted, crowned with pointed tubercles. The muzzle is pointed. Ears moderately rounded, and nearly naked. Fore feet with five sub-equal toes, with compressed, slightly curved pointed claws. Hind feet with the outer toes sub-equal, with claws similar to those in the fore feet; the first toe almost always distinct and partially opposable, though small and nailless, sometimes absent.

In some respects intermediate between the preceding and the next genus is Dasyuroidea byrnei, of Central Australia, an animal of the size of a rat, with one lower premolar less than in Phascologale, without the first hind toe, and with a somewhat thickened tail. The pouch is incomplete, with two lateral folds, and the number of teats six.

Sminthopsis includes several very small species, with the same dental formula as Phascologale, but distinguished from the genus by the narrowness of the hind foot, in which the first toe is present, and the granulated or hairy (in place of broad, smooth and naked)
soles. A pouch is present, and there are eight or ten teats. Nearly allied is the jumping Antechinomys laniger, of East Central Australia, an elegant mouse-like creature, with large oval ears, elongated limbs, a long and tufted tail and no hind toe. In connexion with the large size of the ears is the excessive inflation of the auditory bulla of the skull.

From all other members of the family the marsupial, or banded, ant-eater (Myrmecobius fasciatus) differs by the presence of more than seven pairs of cheek-teeth in each jaw, as well as by the exceedingly long and protrusile tongue. Hence it is made the type of a distinct subfamily, the Myrmecobiinae, as distinct from the Dasyurinae, which includes all the other members of the family. From the number of its cheek-teeth, the banded ant-eater had been regarded as related to some of the primitive Jurassic mammals; but this view is disputed by Mr. Bensley, who regards this multiplicity of teeth as a degenerate feature. On the other hand, it is noteworthy that this marsupial retains in its upper jaw the so-called mylo-hyoid groove, which is found in the aforesaid Jurassic mammals. Myrmecobius has a total of 52 or 54 teeth, which may be classed as I., C., P, + M, 4 or 5. The teeth are all small and (except the four posterior inferior molars) separated from each other by an interval. Head elongated, but broad behind; muzzle long and pointed; ears of moderate size, ovate and rather pointed. Fore-feet with five toes, all having strong pointed, compressed claws, the second, third and fourth nearly equal, the fifth somewhat and the first considerably shorter. Hind-feet with no trace of first toe externally, but the metatarsal bone is present. Tail long, clothed with long hairs. Fur rather harsh and bristly. Female without pouch, the young when attached to the nipples being concealed by the long hair of the abdomen. Vertebræ: C. 7, D. 13, L. 6, S. 3, C. 23.

From Gould.

**Fig. 4.**—The Marsupial or Banded Ant-eater (Myrmecobius fasciatus).

The single species, which is a native of western and southern Australia, is about the size of an English squirrel, to which its long bushy tail gives it some resemblance; but it lives entirely on the ground, especially in sterile sandy districts, feeding on ants. Its prevailing colour is chestnut-red, but the hinder part of the back is marked with broad, white, transverse bands on a dark ground.

With the banded ant-eater, or Peramelidae, we come to a family of polyprotodonts which resemble the diprotodonts in the peculiarly specialized structure of their hind limbs; an adaptation which we must apparently regard as having been independently acquired in the two groups. The dentition is I., C., P, + M, 4 or 5, total, 48: the upper incisors being small, with short, broad crowns; the lower incisors moderate, narrow, procumbent; canines well developed. Premolars compressed, pointed; and the molars with quadrate tuberculated crowns. Deciduous premolar preceded by a minute molariform tooth, which remains in place until the animal is nearly full grown. Fore feet with two or three of the middle toes of nearly equal size, and provided with strong, sharp, slightly curved claws, the other toes rudimentary. Hind feet long and narrow; the first toe rudimentary or absent; the second and third very slender and united in a common integument; the fourth very large, with a stout elongated conical claw; the fifth smaller than the fourth (see fig. 6).

The terminal phalanges of the large toes of both feet clasp at their extremities. Head elongated, with the muzzle long, narrow and pointed. Stomach simple. Caecum of moderate size. Pouch complete, generally opening backwards. Alone among marsupials bandicoots have no clavicles. More remarkable still is the development of a small allantoic placenta.

In the true bandicoots of the genus Perameles (fig. 5) the fore-feet have the three middle toes well developed, the third slightly larger than the second, the fourth somewhat shorter, provided with long, strong, slightly curved, pointed claws. First and fifth toes very short and without claws. Hind feet with one or two phalanges, in the first toe forming a distinct tubercle visible externally; the second and third toes very slender, of equal length, joined as far

From Gould.

**Fig. 5.**—Gunn's Bandicoot (Perameles gunni).

as the terminal phalange, but with distinct claws; the fifth intermediate in length between these and the largely developed fourth toe. Ears of moderate or small size, ovate, pointed. Tail rather short, clothed with short depressed hairs. Fur short and harsh. Pouch opening backwards. Vertebræ: C. 7, D. 13, L. 6, S. 1, C. 17. (see Bandicoot.)

The rabbit-bandicoot, Peragale (or Thylacomyx) represents a genus in which the cheek-teeth are curved, with longer crowns and shorter roots than in the last. Hind extremities proportionally longer with inner toe represented only by a small metatarsal bone. Muzzle much elongated and narrow. Fur soft and silky. Ears very large, long and pointed. Tail long, its apical half-clothed on the dorsal surface with long hairs. Pouch opening forwards. Vertebræ: C. 7, D. 13, L. 6, S. 2, C. 23.

The one species, from Western Australia, is the largest member of the family, being about the size of a rabbit, to which it bears sufficient superficial resemblance to have acquired the name of "native rabbit" from the colonists. It burrows in the ground, but in other respects resembles bandicoots in habits.

In the pig-footed bandicoot (Chooropus castanotis) the dentition generally resembles that of Perameles, but the canines are less developed, and in the upper jaw two-rooted. Incisors slender; posterior nearly twice the length of the anterior. Fore feet with the functional toes reduced to two, the second and third, of equal length, with closely united metacarpals and short, sharp, slightly curved, compressed claws. First toe represented by a minute rudiment of a metatarsal bone; the fourth by a metatarsal and two small phalanges without a claw; and not reaching the middle of the metatarsal of the third; fifth entirely absent. Hind foot long and narrow, mainly composed of the strongly developed fourth toe, terminal phalanx a conical pointed nail, with a strong pad behind it; the first toe, represented by a rudimentary metatarsal; the remaining toes completely developed, with claws, but exceedingly slender; the united second and third reaching a little way beyond the metatarso-phalangeal articulation of the fourth; the fifth somewhat shorter. Tail not quite so long as the body, and covered with short hairs. Ears large and pointed, and folded down when the animal is at rest. Fur soft and loose. Pouch opening backwards. Vertebræ: C. 7, D. 13, L. 6, S. 1, C. 20.

The only species of this genus is about the size of a small rat, found in the interior of Australia. Its general habits and food appear to resemble those of other bandicoots. A separate family, Notoryctidae, is represented by the marsupial mole (Notoryctes typhlops), of the deserts of south Central Australia, a silky, golden-haired, burrowing creature, with a curious leathery muzzle, and a short, naked stump tail. The limbs are five-toed, with the third and fourth toes of the front pair armed with enormous digging claws.
there are no external ear-conchs; and the dentition includes four pairs of upper, and three of lower, incisors, and distinctly tritubercular cheek-teeth. The small pouch, supported by the usual epipubic bones, opens backwards. In correlation with its burrowing habits, some of the vertebræ of the neck and of the loins are respectively welded together. The eyes have degenerated to a greater extent than those of any other burrowing mammal, the retina being reduced to a mass of simple cells, and the cornea and sclerotic ("white") to a pear-shaped fibrous capsule enclosing a ball of pigment. The reason for this extreme degeneration is probably to be found in the sandy nature of the soil in which the creature burrows, a substance which would evidently irritate and inflame any functional remnant of an eye. The portion of the lachrymal duct communicating with the cavity of the nose has, on the other hand, been abnormally developed, apparently for the purpose of cleansing that chamber from particles of sand which may obtain an entrance while the animal is burrowing. (See MARSUPIAL MOLE.)

2. Paucituberculata.—The second suborder of marsupials, the Paucituberculata, is exclusively South American, and typically represented by the family Epanorthidæ, the majority of the members of which are extinct, their remains being found in the probably Miocene Santa Cruz beds of Patagonia, although one existing genus (Caenolestes) survives in Ecuador and Colombia. One of the two living species was, indeed, described so long ago as the year 1863, under the preoccupied name of Hyracodon, but attracted little or no attention, as its affinities were not fully recognized. Externally Caenolestes has a shrew-like appearance. The elongated skull (fig. 8) has four pairs of upper incisors and long upper canines, while in the lower jaw there is a single pair of procumbent incisors.

followed by several small teeth representing the canine and earlier premolars. The three pairs of molars in each jaw are, like the last premolar, quadrirubercular oblong teeth. The five-toed feet are of normal structure, and the rat-like tail is prehensile towards the tip. The female has a small pouch. The extinct members of the family are represented by the genera Epanorthus, Aedestis, Garama, &c. In a second family—Abderidæ—from the Patagonian Miocene, the penultimate premolar is developed into an enormous tooth, with a tall, secan and grooved crown, somewhat after the fashion of the enlarged premolar of Plagiaulax. From the structure of the skull, it is thought probable that Abderis had an elongated snout, like that of many insectivora. As a sub-order, the

Paucituberculata are characterized by the presence of four pairs of upper and three of lower incisor teeth; the enlargement and forward inclination of the first pair of lower incisors, and the presence of four or five sharp cusps on the cheek-teeth, coupled with the absence of "syndactylyism" in the hind limbs.

3. Diprotodonts.—The third and last sub-order of marsupials is the Diprotodontia, which is exclusively Australasian and includes the wombats, koala, cuscuses, kangaroos and their relatives. There are never more than three pairs of upper and one of lower incisors, of which the middle upper and the single lower pair are large and chisel-like (fig. 9); the canines are small or absent; the cheek-teeth have bluntly tuberculate or transversely-ridged crowns in most cases; and the hind-feet are syndactylous. With one exception, the intestine has a caecum, and the pouch is large and opens forwards. It should be added that Professor Elliot Smith has pointed out a certain peculiarity in its commissures whereby the brain of the diprotodonts differs markedly from that of the polyprotodonts and approximates to the placental type. Dr Einar Lönberg has also recorded certain adaptive peculiarities in the stomach. Most of the species, particularly the specialized types, are more or less completely herbivorous.

The first family, Phascolomyidae, is typified by the wombats; but according to the view adopted by Mr H. Winge, and endorsed by Professor Max Weber, is also taken to include the koala. In this wider sense the family may be characterized as follows. The tympanic process of the alisphenoid bone of the skull is short, not covering the cavity of the tympanum, nor reaching the paroccipital process. The tail is rudimentary, the first hind-toe opposable, the first pair of upper incisors very large, but the second and third either absent or small and placed partially behind the larger pair; and only five pairs of cheek-teeth in each jaw. The stomach has a cardiac gland, and the number of teats is two.

In the wombats (Phascolomys) the dentition is i 1 c 3 p m 1 total 24; all the teeth growing from persistent pulps, and the incisors large and chisel-like, with enamel only on the front surface. The cheek-teeth strongly curved, forming from the base to the summit about a quarter of a circle, the concavity being directed outwards in the upper and inwards in the lower teeth. The first of the series (which appears to have no predecessor) single-toothed; the other four composed of two lobes, each subtriangular in section. Lips equal, stout and short. Fore-feet with five distinct toes, each furnished with a long, strong and slightly curved nail, the first and second only short; and the third toe, partially united by integument, of nearly equal length, the fifth distinct and rather shorter; all four nails long and curved nails. In the skeleton the second and third toes are distinctly more slender than the fourth, showing a tendency towards the character so marked in the following families. Tail rudimentary. Caecum very short and wide, with a vermiform appendage (see Winge, 1877).

In addition to remains referable to the existing genus, the Pleistocene deposits of Australia have yielded evidence of an extinct giant wombat constituting the genus Phascolos (Sceparodon). The koala, or "native bear" (Phascolarctus cinereus), which differs widely from the wombats in its arboreal habits, is less specialized as regards its dentition, of which the formula is i 1 c 3 p m 1 total 30. Upper incisors crowded together, cylindrical, the first much larger than the others, with a bevelled cutting edge (fig. 9). Canine very small; a considerable interval between it and the first premolar, which is as long from before backwards but not so broad as the molars, and has a cutting edge, with a smaller parallel inner ridge. The molar-like teeth slightly diminishing in size from the
first to the fourth, with square crowns, each bearing four pyramidal cusps. The lower incisors are partially inclined forwards, compressed and tapering, bevelled at the ends. Cheek-teeth in continuous series, as in the upper jaw. Fore-feet with the two inner toes slightly separated from and opposed to the remaining three, all with strong curved and much compressed claws. Hind-foot with the two pairs of feet forming the same as that of the rat-kangaroos, but relatively much larger; molars rudimentary, tubercular. The functional teeth are reduced to one

pair of large cutting incisors situated close to the middle line, and one great, cutting, compressed cuspal, or long and dilated, with numerous folds. Vertebrae: C. 7, D. 11, L. 8, S. 2, C. 8. Ribs eleven pairs (see KOALA).

Briefly we have noticed three genera of large extinct marsupials from the Pleistocene of Australia whose affinities appear to ally them to the Phalangeridae, and to the phalangers on the other. The longest known is Diprotodon, an animal of the size of a rhinoceros, with a dental formula of I. 1, c. 2, p. + m. 4, total 28. The first upper incisor very large and chisel-like, molars with prominent transverse ridges, as in Macropus, but without the longitudinal connecting ridge. Complete skeletons disinterred by Dr E. C. Stirling indicate that in the structure of the feet this creature presents resemblances both to the wombats and the phalangers, but is nearer to the former than to the latter. On the other hand, the considerably smaller Nototherium, characterized by its sharp and broad skull and smaller incisors, seems to have been much more wombats-like, and may perhaps have possessed similar burrowing habits.

The last of the three is Thylacoleo carnifex, so named on account of its supposed carnivorous habits. In the adult the incisors (fig. 11) is 1, c. 2, p. + m. 4, total 24. The first upper incisor is much larger than the others; canine and first two premolars rudimentary. In the lower jaw there are also one or two small and early deciduous premolars, which are formed on the same type as that of the rat-kangaroos, but relatively much larger; molars rudimentary, tubercular. The functional teeth are reduced to one

By means of the little musk-kangaroo, the cuscuses and phalangers, constituting the family Phalangeridae, are so closely connected with the kangaroos, or Macropodidae, that in the opinion of some naturalists they ought all to be included in a single family, with three sub-families. Theoretically, no doubt, this is correct, but the typical members of the two groups are perfectly distinct in appearance, and from the point of view of convenience, the retention of the two families seems advisable. From the Phascolomyidae, the two families, which may be collectively designated Phalangeridae, differ by the circumstance that in the skull the tympanic process of the alisphenoid covers the tympanic cavity and reaches the paroccipital process. The tail is long and in some cases prehensile; the first hind-toe may be either large, small or absent; the dentition usually includes three pairs of upper and one of lower incisors, and six or seven pairs of cheek-teeth in each jaw: the stomach is either simple or sacculated, without a cardiac gland; and there are four teats.

With the exception of the aberrant long-snouted phalanger, the members of the family Phalangeridae have the normal number of functional incisors, in addition to which there may be one or two rudimentary pairs in the lower jaw. The first in the upper jaw is strong and curved, cutting as the other two generally somewhat smaller; the single lower functional incisor large, more or less inclined forwards; canines upper small or moderate, conical and sharp-pointed; lower absent or rudimentary; premolars variable; molars, with four obtuse tubercles, sometimes forming a single transverse band.

The lower jaw has no pocket on the outer side. All are animals of small or moderate size and arboreal habits, feeding on a vegetable or mixed diet, and inhabiting Australia, Papua and the Moluccan Islands.

As the first example of the group may be taken the elegant little long-nosed phalanger (Thylacinus ruflatius, fig. 12), a west Australian cuscus, of the size of a mouse, which may be regarded as representing by itself a sub-family (Tarsipesinae), characterized by the rudimentary teeth, the long and extensile tongue, and absence of a caecum. The head is elongated, with a slender muzzle and the mouth-opening small. The two lower incisors are long, very slender, sharp-pointed and horizontally placed. All these teeth are simple, conical, minute and placed at considerable and irregular intervals apart in the jaws, the number appearing to vary in different individuals, and even on different sides of the jaw of the same individual. The formula in one specimen was: 2 2 c. 1 1 p. m. 3 4; total 20. The lower jaw is slender, nearly straight, and without a coronoid process or inflected angle. Fore-feet with five well-developed toes, carrying small, flat, scale-like nails, not reaching the extremity of the digits. Hind-feet rather long and slender, with a well-developed opposable and nailless first toe;
second and third digits united, with sharp, compressed curved claws; the fourth and fifth free, with small flat nails. Ears of moderate size and rounded. Tail longer than the body and head, scantly clothed with short hairs, prehensile. Vertebræ: C. 7, D. 13, L. 5, S. 24 (fig. 10, C. a. 2).

As indicated in the accompanying illustration, the long-sounged phalanger is arboreal in habits, extracting honey and probably small insects from long-tubed flowers by means of its extensile tongue.

The remaining members of the family may be included in the subfamily Phalangerinae, characterized by the normal nature of the dentition (which shows rudimentary lower canines) and tongue. Cuscuses and phalangers form a numerous group, all the members of which can be termed arboreal, and some of which are associated with long squeeles and expansions of skin enabling them to glide from tree to tree like flying-squirrels. The true phalangers, or opossums of the continent, constitute the genus Trichosurus, while the ring-tailed species are known as Pseudechis; the latter ranging to New Guinea. Dactylopiia is easily recognized by the presence of the distal-molar-like teeth, the flying species are classed as Petaurides, Petaurus, Gymnothriæ and Acrobatæ, the last no larger than a mouse; while Dromicia, Distachura and Acrobatæ are allied types without parachutes (see PHALANGER).

An equally brief notice must suffice of the kangaroo tribe or Macropodidæ, since these receive a special notice elsewhere. The dentition is i. 3, 0 or 1, 3, m. 1, 3; the incisors being sharp and cutting, and those of the lower jaw frequently having a scissors-like action against one another. The broad molars are either bluntly tuberculated or transversely ridged; the outer side of the hind part of the lower jaw has a deep pocket; and the hind-limbs are generally very small in comparison with the fore-limbs. The family is connected with the Phalangeridæ by means of the musk-kangaroo (Hypsiprymnodon moschatus); forming the sub-family Hypsiprymnodontinae. Then come the rat-kangaroos, or kangaroo-rats, constituting the sub-family Petaurinæ; while the tree-kangaroos (Dorcus and Lepidogale), rock-rabbits (Petrogale), bandicoots and kangaroos (Macropus) form the Macropodidæ (see KANGAROO).

Extinct Marsupials

Reference has been made to the Australasian Pleistocene genera Phascolonus, Diprotodon, Nototherium and Thyacoloc, whose affinities are with the wombats and phalangers. The same deposits have also yielded remains of extinct types of kangaroo, some of gigantic size, constituting the genera Selenotherium, Picrodon and Polochestes. Numerous types more or less nearly allied to the phalangers, such as Burramys and Trilis have also been described, as well as a flying form, Palaeomastix. It is also interesting to note that fossil remains of thylacines and Tasmanian devils on the Australian mainland. Of more interest is the imperfectly known Wynyardia, from older Tertiary beds in Tasmania, which apparently presents points of affinity both to phalangers and to the Oligocene and Miocene marsupials of Europe and America. From the Lower Oligocene beds of England have been obtained numerous remains of opossums referable to the American family Didelphidæ. These ancient opossums have been separated generally from Didelphys (in its widest sense) on account of certain differences in the relative sizes of the lower premolars, and have been assigned to a type of these on lower jaws, of which some hundreds have been found, it is impossible to judge how far these differences are correlated with other dental or osteological characters. In the opinion of Dr H. Filhol, the fossorial types themselves represent two genera, Peratherium, containing the greater part of the species, about twenty in number, and Amblyatherium, with three species only. All are comparatively small animals, few of them exceeding the size of a rat.

Bearing in mind the interesting European fossils, a certain number of diaphlench bones have been found in the caves of Brazil, but these are either closely allied to the species now living in the same region.

The occurrence in the Santa Cruz beds of Patagonia of fossil marsupials allied to the living Caenolestes has been mentioned above. The alleged occurrence in the same beds of marsupials allied to the thylacine is based on remains now more generally regarded as referable to dasyuroid carnivores (see CREODONTA).

Mesoic Mammals.—Under the heading of Multituberculata will be found a brief account of certain extinct mammals from the Mesoic formations of Europe and North America which have been regarded as more or less nearly related to the monotremes. The same deposits also contain remains of small mammals, and this condition approximates more nearly to that of either polyprotodont marsupials or insectivores; and these may be conveniently noticed here without prejudice to their true affinities. Before proceeding further it may be mentioned that the remains of these various types are very scarce, even in formations apparently in every way suitable to the preservation of such fossils, and it hence seems probable that these creatures are stragglers from a country where primitive small mammals were abundant. Not improbably this country was either “Great Britain,” “Gondwanaland,” connecting Mesozoic India with Africa, or perhaps Africa itself. At any rate, there seems little doubt that it was the region where monotremes and other primitive mammals were first differentiated from their reptilian ancestors.

Of the Old World forms, the family Triconodonta is typified by the genus Triconodon, from the English Purbeck, in which the cheek-teeth carry three cutting cusps arranged longitudinally. There seems to have been a replacement of some of these teeth; and it has been suggested that the larger size may have been the result of the marsupial type. To the same family are referred Phascolotherium (fig. 14), of the Lower Jurassic Stonesfield slate of England, and Spalacotherium (fig. 15), of the Dorsetshire Purbeck; the latter having the three cusps of the cheek-teeth rotated so as to assume a triturcular type. Other genera are Menocodon and Pliocodon, the former American, and the latter common to Europe and North America. By one authority Amphilestes (fig. 16), of the Stonesfield Slate, is included in the same group, while by a second it is regarded as representing a family by itself. Amphilestidae, to which the Stonesfield type, typifies the family Amphilestidae, which includes the American Brymelestes, and in which some would class the European Purbeck genus Amblyatherium, although Professor H. F. Osborn has made the last the type of a distinct family. Yet another family, according to the palaeontologist now cited, is typified by the genus Stylacodon, of the English Purbeck. To mention the other forms which have received names will be unnecessary on this occasion.

Over will be observed from the figures of the lower jaws, which are in most cases the only parts known, that in many instances the number of cheek-teeth exceeds that found in modern marsupials except Myrmecobius. The latter has indeed been regarded as the direct descendant of these Mesoic forms; but as already stated, in the opinion of Mr B. A. Beney, this is incorrect. It may be added that the division of these teeth into premolars and molars in figs. 14 and 16 is based upon the view of Sir R. Owen, and is not altogether trustworthy, while the restoration of some of the missing teeth is more or less conjectural. As regards the affinities of the creatures to which these jaws belonged, Professor Osborn has referred some species of Triconodonta and Amphilestes (as represented by the English Purbeck Carleton), to a primitive group of marsupials, while he has assigned the Amblytheriidae and Spalacodontidae to an ancestral assemblage of Insectivora. On the other hand, in the opinion of Professor H. Winge, a large number of these creatures are primitive monotremes. Besides the above, in the Trias of North America we have Dromotherium and Microconodon, extremely primitive forms, representing the family...
MARSUPIAL MOLE—MARTEN, H.

Dromotheriidae, and apparently showing decided traces of reptilian affinity. It may be added that a few traces of mammals have been obtained from the English Wealden, among which incisor tooth fossholes show the rodent type.

MARSUPIAL MOLE (Notoryctes typhlops), the "Ur-quamaat" of the natives, an aberrant polyprotodont from central South Australia, constituting a family (Notoryctidae). This is a small burrowing animal, of a pale golden-yellow colour, with long silky hair, a horny shield on the nose, and a stumpy leathery tail. The feet are five-toed, and the third and fourth toes of the front pair armed with enormous claws adapted for digging. Neither ear-conches nor eyes are visible externally. There are but three pairs of incisor teeth in each jaw, and the upper molars are tricuspoid. This animal spends most of its time burrowing in the sand in search of insects and their larvae, but occasionally makes its appearance on the surface.

MARSUS, DOMITIUS. Latin poet, the friend of Virgil and Tibullus, and contemporary of Horace. He survived Tibullus (d. 19 B.C.), but was no longer alive when Ovid wrote (c. a.d. 12) the epistle from Pontus (Ars Pontic, iv. 10) containing a laudatory ode. He was the author of a work called Cricula ("hemlock") from their bitter sarcasm, and of a beautiful epitaph on the death of Tibullus; of elegiac poems, probably of an erotic character; of an epic poem Amazonis; and of a prose work on wit (De urbanitate). Martial often alludes to Marsus as one of his predecessors, but he is never mentioned by Horace, although a passage in the Odes (iv. 4, 10) is supposed to be an indirect allusion to the Amazonis (M. H. A. O. Paris, iii. 332).

See J. A. Weichert, Poetarum Latinorum vita et religiæ (1830); R. Unger, De Dom. Marsi circulo (Friedland, 1861).

MARSYAS, in Greek mythology, a Phrygian god or Silenus, son of Hyagnis. He was originally the god of the small river of the same name near Celaenae, an old Phrygian town. He represents the art of playing the flute as opposed to the lyre—the one the accomplishment of the worship of Cybele, the other that of the worship of Apollo. According to the legend, Athena, who had invented the flute, threw it away in disgust, because it disturbed the features. Marsyas found it, and having acquired great skill in playing it, challenged Apollo to a contest with his lyre. Midas, king of Phrygia, who had been appointed judge, declared in favour of Marsyas, and Apollo, in revenge, caused Marsyas by changing his ears into ass's ears. In another version, the Muses were judges and awarded the victory to Apollo, who tied Marsyas to a tree and flayed him alive. Marsyas, as well as Midas and Silenus, are associated in legend with Dionysus and belong to the cycle of legends of Cybele. A statue of Marsyas was set up in the Roman forum and colonies as a symbol of liberty.

The contest and punishment of Marsyas were favourite subjects in Greek art, both painting and sculpture. In Florence there are several statues of Marsyas hanging on the tree as he is going to be flayed (see Greek Art, fig. 54, Pl. II); Apollo and the executioner complete the group. In the Lateran museum at Rome there is a statue representing Marsyas in the act of playing the flute, a copy of a masterpiece by Myron (Hyginus, Fab. 167, 105; Apollo and Marsyas hanging on the tree, a copy of a statue by Myron, Cl. 145-149), for which see Greek Art, fig. 64 (Pl. III.).

MARTABAN, a town in the Thaton district of Lower Burma, on the right bank of the Salween, opposite Moulmein. It is said to have been founded in A.D. 573, by the first king of Pegu, and was once the capital of a powerful Taungking kingdom; but it is now little more than a village. Martaban is frequently mentioned by European voyagers of the 17th century; and it has given the name of "Martavans" to a class of large vessels of glazed pottery, also known in India as "Pegu jars." It was twice captured by the British, in 1824 and 1852. The Bay of Martaban receives the rivers Irrawaddy and Salween.

MARTELLO TOWER, a kind of tower formerly used in English coast defence. The name is a corruption of Mortella. The Martello tower was introduced in consequence of an incident during the French revolution. In 1793 the British squadron of three ships of the line and two frigates was ordered to support the Corsican insurgents. It was determined in the first place to take a tower on Cape Mortella which commanded the only secure anchorage in the Gulf of San Fiorenzo. This tower, according to James, was named "after its inventor"; but the real derivation appears to be that of a wild myrtle which grew thickly around. The tower, which mounted one 24-pounder and two 18-pounders on its top, was bombarded for a short time by the frigates, was then deserted by its little garrison, and occupied by a landing party. The tower was afterwards retaken by the French from the Corsicans. So far it had done nothing to justify its subsequent reputation. In 1794, however, a fresh attempt was made to support the insurgents. On the 7th of February 1400 troops were landed, and the tower was attacked by land and sea on the 8th. The "Fortitude" and "Juno" kept up a cannonade for 23 hours and then hauled off, the former being on fire and having sixty-two men killed and wounded. The fire from the batteries on shore produced no impression until a hot shot set fire to the base junk with which, to the depth of 5 ft., the insides of the tower were lined, but it was only one of three towers, the others then surrendered. The armament was found to consist only of two 18-pounders and one 6-pounder. The strong resistance offered by these three guns seems to have led to the conclusion that towers of this description were specially formidable, and Martello towers were built in large numbers, and at heavy expense, along the shores of England, especially on the southern and eastern coasts, in which certain parts are lined with these towers at short intervals. They are structures of solid masonry, containing vaulted rooms for the garrison, and providing a platform at the top for two or three guns, which fire over a low masonry parapet. Access is provided by a ladder, communicating with a door about 20 ft. above the ground. In some cases a deep ditch is provided around the base. The chief defect of the tower was its weakness against vertical fire; its masonry was further liable to be cut through by breaching batteries. The French tours modeles were somewhat similar to the Martello towers; their chief use was to serve as keeps to unrevetted works. While the Martello tower owes its reputation and its widespread adoption in Great Britain to a single incident of modern warfare, the round masonry structure entered by a door raised high above the base is to be found in many lands, and is one of the earliest types of masonry fortification.

MARTEN, HENRY (1602-1680), English regicide, was the eldest son of Sir Henry Marten, and was educated at University College, Oxford. As a public man he first became prominent in 1639 when he refused to contribute to a general loan, and in 1640 he entered parliament as one of the members for
MARTEN

785

Berkshire. In the House of Commons he joined the popular party, spoke in favour of the proposed bill of attainder against Strafford, and in 1642 was a member of the committee of safety. Some of his language about the king was so frank that Charles demanded his arrest and his trial for high treason. When the Great Rebellion broke out Marten did not take the field, although he was appointed governor of Reading, but in parliament he was very active. On one occasion he blamed Edward the Levellers, for following a parliament, and having round on some of them, was imprisoned for a few days. In the following year, however, he was made governor of Aylesbury, and about this time took some small part in the war. Allowed to return to parliament in January 1646, Marten again advocated extreme views. He spoke of his desire to prepare the king for heaven; he attacked the Presbyterians, and, supporting the army against the parliament, he signed the agreement of August 1647. He was closely associated with John Lilburne and the Levellers, and was one of those who suspected the sincerity of the political changes. In 1649 he was imprisoned in Whitehall, and in 1650 he was summoned to the trial of Charles I. However, he acted with Cromwell in bringing Charles I to trial; he was one of the most prominent of the king's judges and signed the death warrant. He was then energetic in establishing the republic and in destroying the remaining vestiges of the monarchical system. He was chosen a member of the council of state in 1649, and as compensation for his losses and reward for his services during the war, lands valued at £100 a year were settled upon him. In parliament he spoke often and with effect, but he took no part in public life during the Protectorate, passing part of this time in prison, where he was placed on account of his debts. Having sat among the restored members of the Long Parliament in 1659, Marten surrendered himself to the authorities as a regicide in June 1660, and with some others he was excepted from the act of indemnity, but with a saving clause. He behaved courageously at his trial, which took place in October 1660, but he was found guilty of taking part in the king's death. Through the action, or rather the inaction of the House of Lords, he was spared the death penalty, but was imprisoned at Newgate and then at Chesham Castle when he died on the 9th of September 1660. Although a leading Puritan, Marten was a man of loose morals. He wrote and published several pamphlets, and in 1662 there appeared Henry Marten's Familiar Letters to his Lady of Delight, which contained letters to his mistress, Mary Ward.

Marten's father, Sir Henry Marten (c. 1562–1641), was born in London and was educated at Winchester school and at New College, Oxford, becoming a fellow of the college in 1582. Having become a barrister, he secured a large practice and soon came to the front in public life. He was sent abroad on some royal business, was made chancellor of the diocese of London, was knighted, and in 1617 became a judge of the admiralty court. Later he was appointed a member of the court of high commission and dean of the arches. He became a member of parliament in 1625, and in 1628 represented the university of Oxford, taking part in the debates on the petition of right.

Some authorities have given the Marten family (1860); M. Noble, Lives of the English Regicides (1798); the article by C. H. Firth in Dict. Nat. Biog. (1893); and S. R. Gardiner, History of the Great Civil War and History of the Commonwealth and Protectorate.

MARTEN,1 a name originally belonging to the pine-marten (Mustela martes), but now applied to all members of the same genus of carnivorous mammals (see Carnivora). Martens are limited to the northern hemisphere, ranging throughout the greater part of the northern temperate regions of both Old and New Worlds, and southwards in America to 35° N. lat., while in Asia one species is met with in Java.

The species appear to be similar in their habits. They live in woods and rocky places, and spend most of their time in trees, although descending to the ground in quest of prey. They climb with great facility, and are agile and graceful in their movements. Some are said occasionally to resort to berries and other fruit for food, but as a rule they are carnivorous, feeding chiefly on birds and their eggs, small mammals, as squirrels, hares, rabbits and moles, but chiefly mice of various kinds, and occasionally snakes, lizards and frogs. In proportion to their size they are among the most bloodthirsty of animals, though less so than the weasels. The female makes her nest of moss, dried leaves and grass in the hollow of a tree, but sometimes in a hole among rocks or ruined buildings, and produces several young at a birth, usually from four to six. Though wild and untameable to a great degree if captured when fully grown, if taken young they are docile, and have frequently been domesticated. In the smaller Mustelidae. The pine-marten appears to have been partially domesticated by the Greeks and Romans, and used to keep houses clear from rats and mice. In the same way, according to Brian Hodgson, the yellow-bellied weasel (Putorius kalthis) "is exceedingly prized by the Nepalese for its service in ridding houses of rats. It is easily tamed; and such is the dread of it common to all murine animals that not one will approach a house where it is domiciled." It is, however, to the great value attached to the pelts of these animals that their importance to man is chiefly due. Though all yield fur of serviceable quality, the commercial value varies immensely, not only according to the species from which it is obtained, but according to individual variation, depending upon age, sex, season, and other circumstances. The skins from northern regions are more full and of a finer colour and gloss than those from more temperate climates, as are those of animals killed in winter compared to the same individuals in summer. Fashion has, moreover, set fictitious values upon slight shades of colour. Enormous prices are given to the animals that can be killed with eggs, to supply the demand of the fur trade, Siberia and North America being the principal localities from which they are obtained.

With the exception of the pekan (M. pennant), the martens are much alike in size, general colouring and cranial and dental characters. The following description by Dr Elliott Coues of the American marten (M. americana) will apply almost equally well to most of the others. "It is almost impossible to describe the colour of the pelts, varying in general from bright orange to pale greenish-yellow, as the pelts of many species of Marten, are whitish; the ears usually have a whitish rim, while on the throat there is usually a large tawny-yellowish or orange-brown patch, from the chin to the fore legs, sometimes entire, sometimes broken into a number of smaller, irregular blotches, sometimes forming a large square blotch on the fore part of the upper surface, while the lower part is often entirely black; when the animal is bicolor, like a stoat in summer. The general "brown" has a greysish cast, as far as the under fur is concerned, and is overlaid with rich lustrous blackish-brown in places where the hair is most sparse. The tails and limbs are whitish, the naked nose pads and whiskers are black. The tail occasionally shows interspersed white hairs, or a white tip." The following are the best-known species:

1 By old authors, as Ray, Pennant, Shaw and Fleming, the word is written "Martín," but this form of spelling is now generally reserved for the bird (see Martin). The word, as applied to the animal here described, occurs in most Germanic and Romance languages. In German, marten; Dutch, marten; Danish, maer; English, marten, martens, marten, martens and martellet; French, marte et martrie; Italian, martora and martorella; Spanish and Portuguese, marta. Its earliest known use is in the form martes (Martial, Ep. x. 37), but it can scarcely be an Old Latin word, as it is not found in Pliny or other classical writers, and Martian often introduced foreign words into his Latin. Its etymology has
The Pine-Martens (Mustela martes).

"pine-marten," it does not appear to have any special preference for coniferous trees.

Next comes M. sibirina, the sable (German, Zobel and Zebel; Swedish, sabel; Russian, sobel, a word probably of Turanian origin), which closely resembles the last, if indeed it differs except in the quality of the fur—the most highly valued of that of all the group. The sable is found chiefly in eastern Siberia.

Very distinct is the brilliantly coloured orange-and-black Indian marten (M. flavigula), found from the Himalaya and Ceylon to Java.

The North American M. americana is closely allied to the pine-marten and Asiatic sable. The importance of the fur of this animal as an article of commerce may be judged of from the fact that 15,000 skins were sold in one year by the Hudson's Bay Company as long ago as 1743. It is ordinarily caught in wooden traps of simple construction, being little enclosures of stakes or brush in which the bait is placed upon a trigger, with a short upright stick supporting a log of wood, which falls upon its victim on the slightest disturbance. A line of such traps, several to a mile, often extends many miles. The bait is any kind of meat, a mouse, squirrel, piece of fish or bird's head. It is principally trapped during the colder months, from October to April, when the fur is in good condition, as it is nearly valueless during the shedding in summer. It maintains its numbers partly in consequence of its shyness, which keeps it away from the abodes of men, and partly because it is so prolific, bringing forth six to eight young at a litter. Its home is sometimes a den under ground or beneath rocks, but oftener the hollow of a tree, and it is said to take possession of a squirrel's nest, driving off or devouring the rightful proprietor.

The pkan or Pennant's marten, also called fisher marten, though there appears to be nothing in its habits to justify the ascription of the name of fisher to it, is the largest of the group, the head and body measuring from 24 to 30 in., and the tail 14 to 18 in. It is also more robust in form than the others, its general aspect being more that of a fox than a weasel, in fact its usual name among the American hunters is "black fox." Its general colour is blackish, lighter by mixture of brown or grey on the head and upper fore part of the body, with a light patch on the throat, and unlike other martens generally darker below than above. It is generally distributed in wooded districts throughout the greater part of North America, as far north as Great Slave Lake, lat. 63° N., and Alaska, and extending south to the parallel of 35°; but at the present time is almost exterminated in the settled parts of the United States east of the Mississippi.

MARTENS, F. F. DE—MARTENS, G. F. VON

the hair) 9 to 12 in. This species is extensively distributed throughout northern Europe and Asia, and was formerly common in most parts of Great Britain and Ireland. It is still found in the northern counties of England and North Wales, but in decreasing numbers. In Scotland it is rare, but in Ireland may be found in almost every county occasionally. Though commonly called special work, Martens was chosen to afford it. His book on The Right of Private Property in War, had appeared in 1860, and had been followed in 1875 by that upon The Office of Consul and Consular Jurisdiction in the East, which had been translated into German and republished at Berlin. These were the first of a long series of studies which won for their author a world-wide reputation, and raised the character of the Russian school of international jurisprudence in all civilized countries. First amongst them must be placed the great Recueil des traites et conventions conclus par la Russie avec les puissances étrangères (13 vols., 1874-1902). This collection, published in Russian and French in parallel columns, contains not only the texts of the treaties but valuable introductions dealing with the diplomatic conditions of which the treaties were the outcome. These introductions are based largely on unpublished documents from the Russian archives. Of Martens' original works his International Law of Civilized Nations is perhaps the best known; it was written in Russian, a German edition appearing in 1884-1885, and a French edition in 1887-1888. It displays much judgment and acumen, though some of the doctrines which it defends by no means command universal assent. More openly "tendentious" in character are such treatises as Russia and England in the Central Asia (1879); Russia, Conflict with China (1881), The Egyptian Question (1883), and The African Conference of Berlin and the Colonial Policy of Modern States (1887). In the delicate questions raised in some of these works Martens stated his case with learning and ability, even when it was obvious that he was arguing as a special pleader. Martens was repeatedly chosen to act in international arbitrations. Among the controversies which he helped to adjust were that between Mexico and the United States—the first case determined by the permanent tribunal of The Hague—and the difference between Great Britain and France in regard to Newfoundland in 1891. He played an important part in the negotiations between his own country and Japan, which led to the peace of Portsmouth (Aug. 1905) and prepared the way for the Russo-Japanese convention. He was employed in laying the foundations for The Hague Conferences. He was one of the Russian plenipotentiaries at the first conference and president of the fourth committee—that on maritime law—at the second conference. His visits to the chief capitals of Europe in the early part of 1907 were an important preliminary in the preparation of the programme. He was judge of the Russian supreme court during the cases arising during the war with Japan. He received honorary degrees from the universities of Oxford, Cambridge and Yale; he was also awarded the Nobel Peace Prize in 1902. In April 1907 he addressed a remarkable letter to The Times on the position of the second Duma, in which he argued that the best remedy for the ills of Russia would be the dissolution of that assembly and the election of another on a narrower franchise. He died suddenly on the 20th of June 1909.

See T. E. Holland, in Journal of the Society of Comparative Legislation for October 1909, where a list of the writings of Martens appears.

MARTENS, GEORGE FRIEDRICH VON (1756-1821), German jurist and diplomatist, was born at Hamburg on the 22nd of February 1756. Educated at the universities of Göttingen, Regensburg and Vienna, he became professor of jurisprudence at Göttingen in 1783 and was ennobled in 1789. He was made a councillor of state by the elector of Hanover in 1808, and in 1810 was president of the financial section of the council of state of the kingdom of Westphalia. In 1814 he was appointed privy cabinet-councillor (Geheimer Kabinetrat) by the king of Hanover, and in 1816 went as representative of the king to the Congress of Vienna. He died at Frankfurt on the 21st of February 1821.

Of his works the most important is the great collection of treaties Recueil des traités, &c., from 1761 onwards. Of this the first seven volumes were published at Göttingen (1791-1801), followed by four supplementary volumes partly edited by his nephew Karl von Martens (see below). These were followed by Nouveau recueil, of treaties subsequent to 1808, in 16 vols. (Göttingen, 1817-1842), of which G. F. von Martens edited the first four, the fifth being the
work of K. von Martene, the others (9-10) by F. Saalfeld and (9-10) F. Murhard. A Nouveau supplément, in 3 vols., filling gaps in the previous collection, was also published by Murhard (Göttingen, 1839-1842). This was followed by Nouveau recueil ... continuation du grand recueil ... (Gottingen, 1845-1873), edited by F. Murhard, C. Murhard, H. F. F. F. Martene, and J. Hopf, with a general index of treaties from 1493 to 1874 (1876). This was followed by Nouveau recueil, 2ère série (Göttingen, 1876-1896; vols. xxi.-xxxv., Leipzig, 1897-1908). From vol. x. on this series, the editors were Felix von Martene and J. Hopf, with the assistance of Emil Greifswald. In 1909 appeared vol. i. of a further Continuation (troisième série) under the editorship of Professor Heinrich Triepel of Kiel University.

Of Martene’s other works the most important are the Précis du droit des gens modernes de l’Europe (1789; 3rd ed., Göttingen, 1821; new ed., G. S. Pinheiro-Ferreira, 2 vols., 1858, 1864); Erzählungen merkwürdiger Fälle de neueren europäischen Völkerrechts, 2 vols. (Gottingen, 1830); Cours diplomatique ou histoire des relations des puissances de l’Europe, 3 vols. (Berlin, 1801); Grundriss einer diplomatischen Gesch. de europ. Staatsbücherei u. Friedensgeschichte seit dem Ende des 15. Jahrhunderts (ibid., 1807).

His nephew K. von Martene (1834-1863), who at his death was minister resident of the grand-duke of Weimar at Dresden, published a Manuel diplomatique (Leipzig, 1823), re-issued as Guide diplomatique in two vols. in 1832 (5th ed. by Geffcken, 1866), a valuable textbook of the rules and customs of the diplomatic service. In 1834 he published Nouvelles causes célèbres (2 vols., ibid., 1843), both republished, in 5 vols. (1858-1861); Recueil manuel et pratique de traités (7 vols., ibid., 1840-1857); continued by Geffcken in 3 vols., 1885-1888.

**MARTENSEN, HANS Lassen** (1838-1884), Danish divine, was born at Flensborg on the 19th of August 1808. He studied in Copenhagen, and was ordained in the Danish Church. At Copenhagen he was lector in theology in 1838, professor extraordinary in 1840, court preacher also in 1845, and professor of ordination in 1848; he was made bishop of Seeland. In his studies he had come under the influence of Schleiermacher, Hegel and Franz Baader; but he was a man of independent mind, and developed a peculiar speculative theology which showed a disposition towards mysticism and theosophy. His contributions to theological literature included treatises on Christian ethics and dogmatics, on moral philosophy, on baptism, and a sketch of the life of Jakob Boehme, who exercised so marked an influence on the mind of the great English theologian of the 18th century, William Law. Martensen was a distinguished preacher, and his works were translated into various languages. The "official" eulogy he pronounced upon Bishop Jakob P. Mynster (1775-1854) in 1854, brought down upon his head the invectives of the philosopher Sören Kierkegaard. He died at Copenhagen on the 3rd of February 1884.

Amongst his works are: Grundriss des Systems der Moralphilosophie (1841); 3rd ed., 1879; German, 1845; Die Philosophie der Erkenntnis, 2nd ed., 1845; Prinz Professor Gottfried, 3rd ed., 1860; Des Christlichen Dogmatik, 4th ed., 1883; Eng. trans., 1886; German by himself, 4th ed., 1887; Christliche Ethik (1871; Eng. trans., Part I. 1873, Part II. 1881 seq.); Hintergründe (1870-1872); Katholizismus und Protestantismus (1882; Eng. trans., 1885). An autobiography, Aus meinem Leben, appeared in 1883, and in 1888, after his death, the Briefwechsel zwischen Martensen und Dörner (1888).

**MARTHA’S VINEYARD**, an island including the greater part of Dukes county, Massachusetts, U.S.A., lying about 3 m. off the southern coast of that state. Its extreme length (east to west) is about 20 m., and its extreme width (north to south) about 9 m. Along its north-west and a portion of its north-east shore lies Vineyard Sound. Its principal bays are Vineyard Haven Harbor, a deep indentation at the northernmost angle of the island; and, on the eastern coast, Edgartown Harbor and Katama Bay, both formed by the juxtoposition of Chappaquiddick Island. The surface is naturally flat, excepting a strip about 2 m. broad along the north-western coast, and the sandy beaches of Oak Bluffs (pop. 2,600), which are hilly, with several eminences of 200 to 300 ft., the highest Prospect Peak, in Chilmark township, 308 ft. Gay Head Light; a beacon near the western extremity, stands among picturesque cliffs, 145 ft. above the sea. Along the southern coast are many ponds, all shut off from the ocean by a narrow strip of land, excepting Tisbury Great Pond, which has a small outlet to the sea. Others are Sengekontacket Pond on the eastern coast; Lagoon Pond, which is practically an arm of Vineyard Haven Harbor; and, about a mile east of the Harbor, Chappaquiddock Pond. Martha’s Vineyard is divided into the following townships (from east to west): Edgartown (in the south-eastern part of the island), pop. (1910), 1,910; area, 297 sq. m.; Oak Bluffs (north-eastern portion), pop. (1910), 1,884; area, 79 sq. m.; Tisbury, pop. (1910), 1,216; area, 7 sq. m.; West Tisbury, pop. (1910), 437; area, 30.5 sq. m.; Chilmark, pop. (1910), 282; area, 104 sq. m.; and Gay Head, pop. (1910), 162; area 52 sq. m. The population of the county, including the Elizabeth Isds. (Gosnold town, pop. 152), N. W. of Martha’s Vineyard; Chappaquiddick Island (Edgartown township), and No Man’s Land (a small island south-west of Martha’s Vineyard), was 4561 in 1900 (of whom 645 were foreign-born, including 79 Portuguese and 72 English-Canadians, and 154 Indians), and in 1910, 4504. The principal villages are Oak Bluffs on the north-east coast, facing Vineyard Sound; Vineyard Haven, in Tisbury township, beautifully situated on the west shore of Vineyard Haven Harbor, and Edgartown on Edgartown Harbor—all summer resorts. No Man’s Land, included politically in Chilmark township, lies about 6½ m. south of Gay Head. It is about 13 m. long (east and west) and about 2 m. wide, is composed of treeless swamps, and is used mainly as sheep grazing; there being no practical farming. Martha’s Vineyard is served by steamship lines from Wood’s Hole and New Bedford to Vineyard Haven, Oak Bluffs, and Edgartown. The Martha’s Vineyard railway (from Oak Bluffs to the south-east extremity of the island, by way of Edgartown), opened in 1874, was not a financial success, and had been practically abandoned in 1909, but an electric line from Oak Bluffs to Vineyard Haven provides transit facilities for that part of the island.

For more than a century whale fishing was practically the sole industry of Martha’s Vineyard. It was carried on at first from the shore in small boats; but by the first decade of the 18th century vessels especially built for the purpose were being used, and by 1760 shore fishing had been practically abandoned. The industry, seriously crippled by invasions of British troops during the War of American Independence—especially by a force which landed at Holmes’s Hole (Vineyard Haven) in September 1778—and again during the War of 1812, revived and was at its height in 1840-1850, only to receive another setback during the Civil War. In the last part of the 19th century its decline was rapid, not because of any diminishing scarcity of whales, but because of the introduction of the mineral oils, and by the end of the century whaling had ceased to be of any economic importance. Herring fishing, on both the north and the south shore, occupies a small percentage of the inhabitants, and there is also some deep-sea fishing. Sheep-raising, especially for wool, is an industry of considerable importance, and Dukes county is one of the three most important counties of the state in this industry.

Martha’s Vineyard was discovered in 1602 by Captain Bartholomew Gosnold, who landed (May 21) on the island now called No Man’s Land, and named it Martha’s Vineyard, which name was subsequently applied to the larger island. Captain Gosnold rounded Gay Head, which he named Dover Cliff, and established on what is now Cuttyhunk Island, which he called Elizabeth Island, the first (though, as it proved, a temporary) English settlement in New England. The entire line of sixteen islands, of which Cuttyhunk is the westernmost of the larger ones, have since been called the Elizabeth Islands; they form the dividing line between Buzzards Bay and Vineyard Sound, and in 1834 were incorporated as Gosnold township (pop. in 1910, 1,360). The territory within the jurisdiction of the Council for New England was parcelled in 1635 among the patentees in such a manner as to provide the advantage of the best natural harbors, the best sandy beaches, the best land for sheep-raising, the best woods for lumbering, and the best fishing. In the 17th century both “Martha’s Vineyard” and “Martin’s Vineyard” were used, and the latter appears in a book as early as 1638 and in another as late as 1690, and on a map as late as 1670. It seems probable that the original form was Martin, the name of one of Gosnold’s crew; according to some authorities the name Martha’s Vineyard was adopted by Mayhew in honour of his wife or daughter.
MARTÍ—MARTIAL

terms—owing to insufficient knowledge of the geography of the coast—that both William Alexander, earl of Stirling, and Sir Ferdinando Gorges, proprietor of Maine, claimed Martha's Vineyard. In 1641 Stirling's agent, Forrest, sold to Thomas Mayhew (1592-1682),1 of Watertown, Massachusetts, for $200, the island of Nantucket, with several smaller neighbouring islands, and also Martha's Vineyard. It seems probable that Forrest acted without authority, and his successor, Forrester, was arrested by the Dutch in New Amsterdam and sent to Holland before he could confirm the transfer. In 1644 the Commissioners of the United Colonies, apparently at the request of the inhabitants of Martha's Vineyard, annexed the island to Massachusetts, but ten years later the islanders declared their independence of that colony, and apparently for the next decade managed their own affairs. Meanwhile Mayhew had recognized the jurisdiction of Maine;2 and though the officials of that province showed no disposition to press their claim, it seems that this technical suzerainty continued until 1664, when the Duke of York received from his brother, Charles II., the charter for governing New York, New Jersey, and other territory, including Martha's Vineyard. In 1671 Governor Francis Lovelace, of New York, appointed Mayhew governor for life of Martha's Vineyard; in 1683, the island, with Nantucket, the Elizabeth Islands, No Man's Land, and Chappaquiddick Island were erected into Dukes county, and in 1695 the county was re-incorporated by Massachusetts with Nantucket excluded. Under the new charter of Massachusetts Bay (1601), after some dispute between Massachusetts and New York, Martha's Vineyard became a part of Massachusetts.

There is a tradition that the first settlement of Martha's Vineyard was made in 1632, at or near the present site of Edgartown village, by several English families forming part of a company bound for Virginia, their ship having put in at this harbour on account of heavy weather. It is certain, however, that in 1642, the year after Thomas Mayhew bought the island, his son, also named Thomas Mayhew (c. 1616-1657), and several other persons established a plantation on the site of what is now Edgartown village. This settlement was at first called "Great Harbor," but soon after Mayhew was appointed governor of the island it was named Edgartown, probably in honour of the only surviving son of the Duke of York. The younger Mayhew, soon after removing to Martha's Vineyard, devoted himself to missionary work among the Indians, his work beginning at about the same time as that of John Eliot; he was lost at sea in 1657 while on his way to secure financial assistance in England, and his work was continued successfully by his father.3 The township of Edgartown was incorporated in 1671, and is the county-seat of Dukes county. In 1753 several Edgartown families joined the association made up of Martha's Vineyard, Nantucket, Providence and Newport whalers, who founded Hudson, on the Hudson river, in Columbia county, New York. Oak Bluffs had its origin as a settlement in the camp meetings, which were begun here in 1835, and by 1860 had grown to large proportions. As the village expanded, Mayhew was born at Tisbury, Wiltshire, was a merchant in Southampton, and in 1603 migrated to Martha's Vineyard. About 1633, he moved to Edgartown, Mass., in 1635; was a member of the Massachusetts General Court in 1636-1644, and after 1644 or 1645 lived on Martha's Vineyard.

1 See a letter from Mayhew to Governor Andros in 1675 that about 1641 Mayhew obtained a conveyance to Martha's Vineyard from Richard Vines, agent of Gorges. See F. B. Hough, Papers Relating to the Island of Nantucket, with Documents Relating to the Historical Settlement of that Island, Martha's Vineyard, Sc. (Albany, N. Y., 1856).

2 In 1901, a boulder memorial was erected to the younger Mayhew on the West Tisbury road, between the village of that name and Edgartown. The spot is now marked by a missionary bade fenced to several hundred Indians. The Martha's Vineyard Indians were subject to the Wampanoag tribe, on the mainland, were expert watermen, and were very numerous when the whites first came. New life was filled with witchcraft, Christianity by the Mayhews, and they were friendly to the settlers during King Philip's war. By 1678 their numbers had been reduced to about 1000, and by 1704 to about 300. Soon after this they began to intermarry with negroes, and now only faint traces of them remain.

MARTÍ, JUAN JOSÉ (1570-1604), Spanish novelist, was born at Orihuela (Valencia) about 1570. He graduated as bachelor of canon law at Valencia in 1591, and in 1598 took his degree as doctor of canon law; in the latter year he was appointed co-examiner in canon law at Valencia University, and held the post for twenty years. He died at Valencia, and was buried in the cathedral of that city on the 2nd of December 1604. Marti joined the Valencian Academia de los nuevos, under the name of "Atrevimiento," but is best known by another pseudonym, Mateo Luján de Sayavedra, under which he issued an apocryphal continuation (1602) of Alemán's Guzmán de Alfarache (1599). Marti obtained access to Alemán's unfinished manuscript, and stole some of his ideas; this dishonesty lends point to the sarcastic congratulations which Alemán, in the genuine sequel (1604) pays to his rival's sallies: "I greatly envy them, and should be proud that they were mine." Marti's book is clever, but the circumstances in which it was produced account for its cold reception and afford presumption that the best scenes are not original.

It has been suggested that Martí is identical with Avellaneda, the writer of a spurious continuation (1600) of Don Quixote, but he died before the first part of Don Quixote was published (1605).

MARTIAL (MARCUS VALERIUS MARTIALIS), Latin epigrammatist, was born in one of the years A.D. 35-41, for in book x., of which the poems were composed in the years 95-98, he is found celebrating his fifty-seventh birthday (x. 24). Our knowledge of his career is derived almost entirely from himself. Reference to public events enables us approximately to fix the date of the publication of the different books of epigrams, and from these dates to determine those of various important events in his life. The place of his birth was Bilbilis, officially Augusta Bilbilis, in Spain. His name seems to imply that he was born a Roman citizen, but he speaks of himself as "sprung from the Celts and Iberians, and a countryman of the Tagus;" and, in contrasting his own masculine appearance with that of an effeminate Greek, he draws especial attention to "his stiff Spanish hair" (x. 65, 7). His parents, Fronto and Flaccilla, appear to have died in his youth (v. 34). His home was evidently one of rude comfort and plenty, sufficiently in the country to afford him the amusements of hunting and fishing, which he often recalls with keen pleasure, and sufficiently near the town to afford him the companionship of many comrades, the few survivors of whom he looks forward to meeting again after his four-and-thirty years' absence (x. 104). The memories of this old home, and of other spots, the rough names and local associations which he delights to introduce into his verse, attest the enjoyment which he had in his early life, and were among the influences which kept his spirit alive in the routine of social life in Rome. But his Spanish home could impart, not only the vigorous vitality which was one condition of his success as a wit and poet, but the education which made him so accomplished a writer. The literary distinction obtained by the Senecas, by Lucan, by Quintilian, who belonged to a somewhat older generation, and by his friends and contemporaries, Licinianus of Bilbilis, Decianus of Emerita, and Canius of Gades, proves how eagerly the novel impulse of letters was
received in Spain in the first century of the empire. The success of his countrymen may have been the motive which induced Martial to remove to Rome when he had completed his education. This he did in A.D. 64, one year before the fall of Seneca and Lucan, who were probably his earliest patrons.

Of the details of his life for the first twenty years or so after he came to Rome we do not know much. He published some juvenile poems of which he thought very little in his maturer years, and he laughs at a foolish bookseller who would not allow them to die a natural death (i. 113). Martial had neither youthful passion nor youthful enthusiasm to make him precociously a poet. His faculty ripened with experience and with the knowledge of that social life which was both his theme and his inspiration; and many of his best epigrams are among those written in his last years. From many answers which he makes to the remonstrances of friends—among others to those of Quintilian—it may be inferred that he was urged to practise at the bar, but that he preferred his own lazy Bohemian kind of life. He made many influential friends and patrons, and secured the favour both of Titus and Domitian. From them he obtained various privileges, among others the semestris tribunalis, which conferred on him equestrian rank. He failed, however, in his application to the latter for the magistrate of Silius, which he coveted as the glory of having been invited to dinner by him, and also the fact that he procured the privilege of citizenship for many persons in whose behalf he appealed to him. The earliest of his extant works, that known by the name of Liber spectaculorum, was first published at the opening of the Colosseum in the reign of Titus, and relates to the theatrical performances given by him; but the book as it now stands was given to the world in or about the first year of Domitian, i.e. about A.D. 81. The favour of the emperor procured him the countenance of some of the worst creatures at the imperial court—among them of the notorious Crispinus, and probably of Paris, the supposed author of Juvenal's exile, for whose monument Martial afterwards wrote a eulogistic epitaph. The two books, numbered by editors xiii. and xiv., and known by the names of Xenia and Apophores—inscriptions in two lines each for presents,—were published at the Saturnalia of 84. In 86 he gave to the world the first volume of the twelve books on which his reputation rests. From that time till his return to Spain in A.D. 98 he published a volume almost every year. The first nine books and the first edition of book x. appeared in the reign of Domitian; and the eleven, xi. at the end of A.D. 96, shortly after the accession of Nerva. A revised edition of book x., that which we now possess, appeared in A.D. 98, about the time of the entrance of Trajan into Rome. The last book was written after three years' absence in Spain, shortly before his death, which happened about the year A.D. 102 or 103.

These twelve books bring Martial's ordinary mode of life between the age of five-and-forty and sixty very fully before us. His regular home for five-and-thirty years was Rome. He lived at first up three pairs of stairs, and his "garret" overlooked the laurels in front of the portico of Agrippa. He had a small villa and unproductive farm near Nomentum, in the Sabine territory, to which he occasionally retired from the bores and noises of the city (i. 38, xii. 57). In his later years he had also a small house on the Quirinal, near the temple of Quirinus. At the time when his third book was brought out he had retired for a short time to Cisalpine Gaul, in weariness, as he tells us, of his unremunerative attendance on the levées of the Senate. The fact that he had retired to him the new scenes which he visited, and in a later book (iv. 25) he contemplates the prospect of retiring to the neighbourhood of Aquileia and the Timavus. But the spell exercised over him by Rome and Roman society was too great; even the epigrams sent from Forum Cornelii and the Aemilian Way ring much more of the Roman forum, and of the streets, baths, porticos and clubs of Rome, than of the places from which they are dated. So too his motive for his final departure from Rome in A.D. 98 was a weariness of the burdens imposed on him by his social position, and apparently the difficulties of meeting the ordinary expenses of living in the metropolis (x. 96); and he looks forward to a return to the scenes familiar to his youth. The well-known epigram addressed to Juvenal (xii. 18) shows that for a time his ideal was realized; but the more trustworthy evidence of the prose epistle prefixed to book xii. proves that his contentment was of short duration, and that he could not live happily away from the literary and social pleasures of Rome. The one consolation of his exile was the society of a lady, Marcella, of whom he writes rather as if she were his patroness—and it seems to have been a necessity of his being to have always a patron or patroness—than his wife or mistress.

During his life at Rome, although he never rose to a position of real independence, and had always a hard struggle with poverty, he seems to have known everybody, especially every one of any eminence at the bar or in literature. In addition to Lucan and Quintilian, he numbered among his friends or more intimate acquaintances Silius Italicus, Juvenal, the younger Pliny; and there were many others of high position whose society and patronage he enjoyed. The silence which he and Statius, although authors writing at the same time, having common friends and treating often of the same subjects, maintain, regarded by some as explained by mutual dislike or want of sympathy. Martial in his epigrams shows an undisguised contempt for the artificial kind of epic on which Statius's reputation chiefly rests; and it seems quite natural that the respectable author of the Thebaid and the Silvae should feel little admiration for either the life or the works of the Bohemian epigrammatist.

Martial's faults are of the most glaring kind, and are exhibited without the least concealment. Living under perhaps the worst of the many bad emperors who ruled the world in the 1st century, he addresses him and his favourites with the most servile flattery in his lifetime, censures him immediately after his death (xii. 6), and offers incense at the shrine of his successor. He is not ashamed to be dependent on his wealthy friends and patrons for gifts of money, for his dinner, and even for his dress. We cannot feel sure that even what seem his sincerest tributes of regard may not be prompted by the hope of payment. Further, there are in every book epigrams which cannot be read with any other feelings than those of extreme distaste.

These faults are so unmistakable and undeniable that many have followed a general fashion in writing of him, and have declined to make any further acquaintance with him. Even those who greatly admire his genius, and find the freshest interest in his representation of Roman life and his sketches of manners and character, do not attempt to palliate his faults, though they may partially account for them by reference to the morals of his age and the circumstances of his life. The age was one when literature had either to be silent or to be servile. Martial was essentially a man of letters: he was bound either to gain favour by his writings or to starve. Even Statius, whose writings are in other respects irreproachable, is nearly as fulsome in his adulation. The relation of client to patron had been recognized as an honourable one by the best Roman traditions. No blame had attached to Virgil or Horace on account of the favours which they received from Augustus and Maecenas, or of the return which they made for these favours in their verse. That old honourable relationship had, however, greatly changed between Augustus and Domitian. Men of good birth and education, and sometimes even of high official position (Juven. i. 117), accepted the dole (sportula). Martial, however, following a general fashion in his epigrams, writes to "a lord," and he made the best of the custom. In his earlier career he used to accompany his patrons to their villas at Baiae or Tibur, and to attend their morning levees. Later on he went to his own small country house, near Nomentum, and sent a poem, or a small volume of his poems, as his representative at the early visit. The fault of grossness Martial shares with nearly all ancient and many modern writers who treat of life from the baser or more ridiculous side. That he offends more than perhaps any of them is not, apparently, to be explained on
The best separate edition of the text is that of Lindsay (Oxford, 1902); earlier editions of importance are those of Schneidevin (1842 and 1853), and of Gilbert (Leipzig, 1886). The best commentary is that of L. Friedländer (Leipzig, 1886) in two volumes with apparatus criticus and Latin index, and it is to this that much of what is said below will be found that explains and illustrates Martial's epigrams. There is a large selection from the epigrams with English notes by Paley and Stone (1873), a smaller selection with notes by Stephenson (1880); see also Edwin Post's Selected Epigrams of Martial (1908), with introduction and notes. The translation into English verse by Elphinston (London, 1782) is famous for its absurdity, which drew an epigram from Burns. (W. Y. S.)

MARTIALIS, QUINTUS GARGILIUS, a Latin writer on agricultural subjects. He has been identified by some with the military commander of the same name, mentioned in a Latin inscription of a.d. 260 (C. I. L. viii. 9047) as having lost his life in the colony of Auzia (Aumale) in Mauretania Caesariensis. Considerable fragments of his work (probably called De curis, which treated of the cultivation of trees and vegetables, and also of their medicinal properties, have survived, chiefly in the body of and as an appendix to the Medicina Plinii (an anonymous 4th century handbook of medical recipes based upon Pliny, Nat. Hist. xx.—xxiiii.). Extant sections treat of apples, peaches, quinces, almonds and chestnuts. Gargilius also wrote a treatise on the tending of cattle (De curis bovin), and a biography of the emperor Alexander Severus is attributed by two of the Scriptores historiae Augustae (Aelius Lampridius and Flavius Vopiscus) to a Gargilius Martialis, who may be the same person.

BIBLIOGRAPHY.—Gargilius Martialis . . . fragmenta, ed. A. Mai (1846); Plinius secundus quae fuit medicina, ed. V. Rose (1876); De curis bovin, ed. H. Rose (1880); Plinius maius, ed. P. Kupper (1903) with Vegetable Medicine; "Gargilius Martialis und die Maurenkriege," C. Cichorius in C. Curtius, Leipziger Studien. x. (1887), where the inscription referred to above is fully discussed: see also Teuffel-Schwaib, Hist. of Roman Literature (Eng. trans.), § 380.

MARTIAL LAW. "Martial law" is an unfortunate term and in a sense a misnomer. It describes a suspension of ordinary law, rendered necessary by circumstances of war or rebellion. The confusion arose from the fact that the marshal's court and the martial law before the introduction of articles of war, which were in their turn merged in the Army Act. But martial law is not a law in the proper sense of the term. It is the exercise of the will of the military commander, who, takes upon himself the responsibility of suspending ordinary law in order to ensure the safety of the state. It is declared, by a proclamation issued by the executive, that ordinary law is inadequate to cope with the circumstances, and provides exceptional means of arrest and punishment of persons who resist the government or aid the enemy. But such a proclamation, while invariably issued in order to give publicity to the suspension of ordinary law, does not invest the step with the force of law. It is simply military authority exercised in accordance with the laws and usages of war, and is limited by military necessity. Yet in reality it is part of common law which justifies acts done by necessity for the defence of the commonwealth when there is war. H. W. Halleck in his work on International Law (5: 544), says, "Martial law originates either in the prerogative of the crown, as in Great Britain, or from the exigency of the occasion, as in other states: it is one of the rights of sovereignty, and is essential to the existence of a state, as is the right to declare or to carry on war." This opinion, however, must be read, as regards the British Empire, with the passage in the Petition of Right which is reproduced in the preamble of each annual Army Act, and asserts the illegality of martial law in time of peace in the following terms:—"No man shall be fore-judged or subjected in time of peace to any kind of punishment within this realm by martial law." Therefore, whilst martial law is declared illegal in time of peace, it is indirectly declared lawful in time of war and intestinal commotion when the courts are closed, or when there is no time for their cumbersome action. C. M. Clos, in Military Forces of the Crown, argues that the words of the Petition of Right and of the Military Act since the reign of Anne are plain in this respect "that . . . the crown possesses
the right of issuing commissions in war and rebellion." But he rightly adds that the military commander may permit the usual courts to continue their jurisdiction upon such subjects as he thinks proper. Legislative enactments have also sanctioned this special jurisdiction at various times, notably in 1798, 1799, 1801, and in 1803. These enactments lay down that exceptional powers may be exercised "whether the ordinary courts shall or shall not be open." As an invariable rule an act of indemnity has been passed on the withdrawal of martial law, but only to protect any person in charge of the execution of martial law who has exceeded his powers in good faith.

There has been much discussion as to whether, in districts where martial law has not been proclaimed, a person can be sent for trial from such district into a district where martial law was in operation. It is argued that if the ordinary courts were open and at work in the non-proclaimed district recourse should be had to them. The Privy Council in 1902 (re Marais) refused leave to appeal where the Supreme Court of Cape Colony had declined to issue a writ of Habeas Corpus in these circumstances. Mr Justice Blackburn in his charge in R. v. Eyre says, "I have come to the conclusion that, looking at what martial law was, the bringing of a person into the proclaimed district to be tried might, in a proper case, be justified." The learned judge admits that there should be a power of summary trial, observing all the substantialities of justice, in order to stamp out an insurrection by speedy trial.

Whilst martial law is the will of the commanders, and is only limited by the customs of war and the discretion of those who administer it, still, as far as practicable, the procedure of military law is followed, and a military court is held on the same lines as a court-martial. Charges are simply framed without technicalities. The prisoner is present, the evidence of prosecution and prisoner is taken on oath, the proceedings are recorded, and the sentence of the court must be confirmed according to the rules of the Army Act. Sentences of death and penal servitude must be referred to headquarters for confirmation. In the South African War (1899-1902) these limits of procedure were observed, and when possible will always be.

Entering more into detail, the term martial law has been employed in several senses:—(1) As applied to the military forces of the crown, apart from the military law under the old Mutiny Acts, and the present annual Army Acts. (2) As applied to the enemy. (3) As applied to rebels. (4) As applied to civilian subjects who are not in rebellion, but in a district where the ordinary course of civil life cannot be maintained owing to war or rebellion.

1. In regard to the military forces of the crown, the superseding of justice as administered under the Army Act could only occur in a time of great need; e.g. mutiny of five or six regiments in the field, with no time to take the opinion of any executive authority. The officers commanding would then be bound to take measures for the purpose of suppressing such mutiny, even to putting soldiers to death if necessary. It would be a case where necessity forced immediate action.

2. Martial law as applied to the enemy or the population of the enemy's country, is in the words of the duke of Wellington, "the will of the general of the army, though it must be administered in accordance with the customs of war."

3. But it is as affecting the subjects of the crown in rebellion that the subject of martial law really obtains its chief importance; and it is in this sense that the term is generally used; i.e. the suspension of ordinary law and the temporary government of the country, or parts of it, or all of it, by military tribunals. It has often been laid down that martial law in this sense is unknown to the law of England. A. V. Dicey, for instance, restricts martial law to only another expression for "the common right of the crown and its servants to repel force by force, in the case of invasion, insurrection, or riot, or generally of any violent resistance." But more than this is understood by the term martial law.

When the proposition was laid down that martial law in this sense is unknown to the law of England, it is to be remembered that fortunately in England there never had been a state at all similar to that prevailing in Cape Colony in 1900—1902. It may perhaps be questioned whether the statement would have been made with the same certainty if similar events had been present to the writers' minds.

In the charge delivered by Mr Justice Blackburn in the Jamaica case the law as affecting the general question of martial law is well set out. "By the laws of this country," said Mr Justice Blackburn, "beginning at Magna Carta and getting more and more established, down to the time of the Revolution, when it was finally and completely established, the general rule was that a subject was not to be tried and judged by a court of law, but to be determined by juries subject to the guidance of the judge; that is the general rule, and is established law. But from the earliest times there was this also which was the law, and is the law still, that when there was a foreign invasion or an insurrection, it was the duty of every good subject, in obedience to the officers and magistrates, to resist the rebels, ... in such a case as that of insurrection prevailing so far that the courts of law cannot sit, there must really be a necessity unless there is some power to keep the people in order. ... The principle the crown claims, the prerogative to exercise summary proceedings by martial law ... in time of war when this disturbance was going on, over others than the army. And further than that, the crown made this further claim against the insurgents, which has been expressed, the crown had, at the time, the power to proclaim martial law in the sense of using summary proceedings, to punish the insurgents and to check and stop the spread of the rebellion by summary proceedings. Now no doubt the extent to which the crown had power to do that has never been yet decided. Our law has been declared from time to time and has always been a practical science, that is, the judges have decided so much as was necessary for the particular case, and no more. It has never become part of the law. But it never has come to be decided what this precise power is."

So far as the United Kingdom is concerned the need has never arisen. It has always been found possible to employ the ordinary courts directly the rebels have been defeated in the field and have been made prisoners or surrendered. "Fortunately in England only three occasions have arisen since the Revolution when the authority of the civil power was for a time, and then only partially, suspended," 1715, 1745 and 1780. Croke, Military Forces, ii. 163, says: "Upon the threat of invasion followed by rebellion in 1715, the first action of the government was to issue a proclamation authorizing all officers, civil and military, by force of arms (if necessary) to suppress the rebellion." This, therefore, would only seem to fall within the limited sense in which Dicey understands martial law to be legal, "the right of the crown and its servants to repel force by force." There was no attempt to bring persons before courts-martial who ought to be tried by the common law, and all the extraordinary acts of the crown were sanctioned by parliament. After the rebellion had been suppressed two statutes were passed, one for indemnity and the other for further punishment of the rebels. The proclamation of 1745 was adopted, a proclamation charging civil magistrates to do their utmost to prevent and suppress all riots, and acts of parliament suspending Habeas Corpus, providing for speedy trials; and of indemnity. In the Gordon Riots of 1780 a very similar course was pursued, and nothing was done which would not fall within Dicey's limitation. No prisoners were tried by martial law.

In Ireland the ordinary law was suspended in 1798–1801 and in 1803. In 1798 an order in Council was issued to all general officers commanding H.M. forces to punish all persons acting in, aiding, or in any way assisting the rebellion, according to martial law, either by death or otherwise, as to them should seem expedient for the suppression and punishment of all rebels; but the order was communicated to the Irish houses of parliament, who expressed their approval by addresses to the viceroy. It was during the operation of this order that Wolfe Tone's case arose. Tone, a subject of the king, was captured on board a French man-of-war, and condemned to death by a court-martial. Curran, his counsel, applied to the king's
MARTIGNAC—MARTIN (POPE)

MARTIGNAC published Bordeaux au mois de Mars 1815 (Paris, 1839), and an Essai historique sur les révolutions d'Espagne et l'intervention française de 1823 (Paris, 1832). See also E. DauDET, Le Ministère de M. de Martignac (Paris, 1875).

MARTIGUES, a port of south-eastern France in the department of Bouches-du-Rhône, on the southern shore of the lagoon of Berre, and at the eastern extremity of that of Carente, by which the former is connected with the Mediterranean. Pop. (1906), 4,178. Martigues is 23 m. W.N.W. of Marseilles by rail. Divided into three quarters by canals, the place has been called the Venice of Provence. It has a harbour (used by coasting and fishing vessels), marine workshops, oil and soap manufactures and cod-drying works. A special industry consists in the preparation of **bouillargue** from the roes of the grey mullet caught in the salt lagoons, which rivals Russian caviare.

Built in 1232 by Raymond Bérenger, count of Provence, Martigues was made a viscounty by Joanna I., queen of Naples. Henry IV. made it a municipality in favour of a princess of the house of Luxembourg. It afterwards passed into the hands of the duke of Villars.

**MARTIN, ST.** (c. 316–400), bishop of Tours, was born of heathen parents at Sabaria (Stein am Ägger) in Pannonia, about the year 316. When ten years old he became a catechumen, and at fifteen he reluctantly entered the army. While stationed at Amiens he divided his cloak with a beggar, and on the following night he had the vision of Christ making known to his angels this act of charity to Himself on the part of "Martinus, still a catechumen." Soon afterwards he received baptism, and two years later, having left the army, he joined Hilary of Poitiers, who wished to make him a deacon, but at his own request ordained him to the humblest office of an exorcist. On a visit home he converted his mother, but his zeal against the Arians roused persecution against him and for some time he lived an ascetic life on the desert island of Gallinaria near Genoa. Between 360 and 370 he was again with Hilary at Poitiers, and founded in the neighbourhood the monastery Locociangenae (Liecigé). In 371–372 the people of Tours chose him for their bishop. He did much to extirpate idolatry from his diocese and from France, and to extend the monastic system. To obtain privacy for the maintenance of his personal religion, he established the monastery of Marmoutier-les-Tours (Martinian monastery) on the banks of the Loire. At Trèves, in 385, he treated that the lives of the Priscillianist heretics should be spared, and he ever afterwards refused to hold ecclesiastical synods, and appointed bishops who had sanctioned their execution. He died at Candes in the year 400, and is commemorated by the Roman Church on the 11th of November (duplex). He left no writings, the so-called **Confessio** being spurious. He is the patron saint of France and of the cities of Mainz and Würzburg. The **Life** by his disciple Sulpicius Severus is practically the only source for his biography, but it is full of legendary matter and chronological errors. Gregory of Tours gives a list of 206 miracles wrought by him after his death; Sidonius Apollinaris composed ametrical biography of him. The Feast of St Martin (Martinmas) took the place of an old pagan festival, and inherited some of its usages (such as the **Martinsmännechen**, **Martinseuer**, **Martinshorn** and the like, in various parts of Germany); by this circumstance is probably to be explained the fact that some of the bishops regarded the drinking and jovial meetings, as well as of reformed drunkards.

See A. Dupuy, Geschichte des heiligen Martins (Schaffhausen, 1858); J. G. CamenoVE in Dict. chr. biog. iii. 838.

**MARTIN** (Martinus), the name of several popes.

**MARTIN I.** succeeded Theodore I. in June or July 649. He had previously acted as papal apocrisiarius at Constantinople, and was held in high repute for learning and virtue. Almost his first official act was to summon a synod (the first Lateran) for dealing with the Monothelite heresies. It met in the Lateran church, was attended by one hundred and five bishops (chiefly from Italy, Sicily and Sardinia, a few being from Africa and other quarters), held five sessions or "secretarii" from the 5th to the 31st of October 649, and in twenty canons condemned the Monothelite heresy, its authors, and the writings by which
Martin V. himself settled a great number of points, and then passed a series of special concordats with Germany, France, Italy, Spain and England. Though this was not the thorough reform of which need was felt, the council itself gave the pope a satisfice. When the council was dissolved Martin V. made it his task to regain Italy. After staying for long periods at Mantua and Florence, where the deposed pope, Baldassare Cossa (John XXIII.), came and made submission to him, Martin V. was enabled to enter Rome (Sept. 30, 1420) and measure the extent of the ruins left there by the Great Schism of the West. He set to work to restore some of these ruins, to reconstruct and pacify the Papal State, to put an end to the Schism, which showed signs of continuing in Aragon and certain parts of southern France; to enter into negotiations, unfortunately unfruitful, with the Greek Church also with a view to a return to unity, to organize the struggle against heresy in Bohemia; and, finally, to welcome and act as patron to saintly reformers like Bernardino of Siena and Francesca Romana, foundress of the nursing sisterhood of the Oblate di Tor de' Specchi (1425).

In accordance with the decree Frequens, and the promises which he had made, Martin V., after an interval of five years, summoned a new council, which was almost immediately transferred from Pavia to Siena, in consequence of an epidemic (1425). But the small number of fathers who attended at the latter town, and above all, the disquieting tendencies which began to make themselves felt there, induced the pope to force on a dissolution of the synod. Pending the reunion of the new council which had been summoned at Basel for the end of a period of seven years, Martin V. himself endeavoured to effect a reformation in certain points, but he was carried off by apoplexy (Feb. 20, 1431), just as he had designated the young and brilliant Cardinal Giuliano Cesarini to preside in his place over the council of Basel.

Martin, B. L. H.

MARTIN, B. L. H.

973

it had been promulgated: In this condemnation were included, not only the Estique or exposition of faith of the patriarch Sergius for which the emperor Heraclius had stood sponsor, but also the Typus of Paul, the successor of Sergius, which had the support of the reigning emperor (Constans II.). Martin published the decrees of his Lateran synod in an encyclical, and Constans replied by enjoining his exarch to seize the pope and send him prisoner to Constantinople. Martin was arrested in the Lateran (June 15, 653), hurried out of Rome, and conveyed first to Naos and subsequently to Constantinople (Sept. 17, 654). He was ultimately banished to Cherson, where he arrived on the 26th of March 655, and died on the 16th of September following. His successor was Eugenius I. (L. D.)*

A full account of the events of his pontificate will be found in Hefele’s Conciliorum, vol. iii. (1877).

Martin II., the name commonly given in error to Martinus II. (q.v.).

Martin III., see Martinus II.

Martin IV. (Simon Mompitié de Brion), pope from the 22nd of February 1281 to the 28th of March 1285, should have been named Martin II. He was born about 1210 in Touraine. He became a priest at Rouen and canon of St. Martin's of Tours, and was made chancellor of France by Louis IX. in 1260 and cardinal-priest of Sta. Cecilia by Urban IV. in 1261. As papal legate in France he held several synods for the reformation of the clergy and conducted the negotiations for the assumption of the crown of Sicily by Charles of Anjou. It was through the latter's influence that he succeeded Nicholas III., after a six-months' struggle between the French and Italian cardinals. The Romans at first declined to receive him, and he was consecrated at Orvieto on the 23rd of March 1281. Peaceful and unassuming, he relied completely on Charles of Anjou, and showed little ability as pope. His excommunication of the emperor Michael Palaeologus (Nov. 1281), who stood in the way of the French projects against Greece, weakened the union with the Eastern Christians, dating from the Lyons Council of 1274. He unduly favoured his own countrymen, and for three years after the Sicilian Vespers (Mar. 31, 1282) he employed all the spiritual and material resources at his command on behalf of his patron against Peter of Aragon. He was driven from Rome by a popular uprising and died at Perugia.

His successor was Honorius IV. (C. H. H.)

His registers have been published in the Bibliothèque des écoles françaises d'Athènes et de Rome (Paris, 1901).

Martin V. (Otto Colonna) (1417-1431) was elected at Constance on St. Martin's Day, in a conclave composed of twenty-three cardinals and thirty delegates from the five different "nations" of the council. Son of Agapito Colonna, who had himself become a bishop and cardinal, the new pope belonged to one of the greatest Roman families; to Urban VI. had been due his entry, as referendarius, upon an ecclesiastical career. Having become a cardinal under Innocent VII., he had seceded from Gregory XII. in 1408, and together with the other cardinals at Pisa, had taken part in the election of Alexander V. and afterwards of John XXIII. At Constance, his rôle had been chiefly that of an arbiter; he was a good and gentle man, leading a simple life, free from intrigue. While refraining from making any pronouncement as to the validity of the decrees of the fourth and fifth sessions, which had seemed to proclaim the supremacy of the Church over high popes, Martin V. nevertheless soon revealed his personal feelings, by having a constitution read in consistory which forbade any appeal from the judgment of the sovereign pontiff in matters of faith (May 10, 1418). As to the reform, of which everybody felt the necessity, the fathers in council had not succeeded in arriving at any agreement.
and was elected life senator in 1878, but he left no mark as a politician. He died in Paris on the 14th of December 1883.

Among his minor works may be mentioned.—De la France, de son génie et de ses destinées (1847); Daniel Manin (1860), La Russie et l'Europe (1866); Études d'archéologie celtique (1872); Les Napoléon et les frontières de la France (1874). See his biography by Gabriel Hanet, Histoire des Martiniens; carte, sa mort, ses œuvres, etc.

MARTIN, CLAUD (1752-1800). French adventurer and officer in the army of the English East India Company, was born at Lyons on the 4th of January 1753, the son of a cooper. He went out to India in 1751 to serve under Dupleix and Lally in the Carnatic wars. When Pondicherry fell in 1761, he seems, like others of his countrymen, to have accepted service in the Bengal army of the English, obtaining an ensign's commission in 1763, and steadily rising to the rank of major-general. He was employed on the building of the new Fort William at Calcutta, and afterwards on the survey of Bengal under Rennell. In 1776 he was allowed to accept the appointment of superintendent of the arsenal of the nawab of Oudh at Lucknow, retaining his rank but being ultimately placed on half pay. He acquired a large fortune, and on his death (Sept. 13, 1800) he bequeathed his residuary estate to found institutions for the education of European children at Lucknow, Calcutta and Lyons, all known by the name of "La Martinerie." That at Lucknow is the best known. It was housed in the palace that he had built called Constantia, which, though damaged during the Mutiny, retains many personal memorials of its founder.

MARTIN, FRANÇOIS XAVIER (1763-1846). French jurist and author, was born in Marseilles, France, on the 17th of March 1762, of Provençal descent. In 1780 he went to Martinique, and before the close of the American war of Independence went to North Carolina, where (in New Bern) he taught French and learnt English, and set up as a printer. He studied law, and was admitted to the North Carolina bar in 1789. He published various legal books, and edited Acts of the North Carolina Assembly from 1715 to 1803 (2nd ed., 1800). He was a member of the lower house of the General Assembly in 1806-1807. In 1809 he was commissioned a judge of the superior court of the territory of Mississippi, and in March 1810 became judge of the superior court of the territory of Orleans. Here the law was in a chaotic condition, what with French law before O'Reilly's rule, then a Spanish code, and in 1808 the Digest of the Civil Laws, an adaptation by James Broom and Moreau Lislet of the code of Napoleon, which repealed the Spanish fueros, partidas, repetitions and laws of the Indies only as they conflicted with its provisions. Martin published in 1811 and 1813 reports of cases decided by the superior court of the territory of Orleans. For two years from February 1813 Martin was attorney-general of the newly established state of Louisiana, and then until March 1846 a judge and (from 1836 to 1846) presiding judge of the superior court of the state. For the period until 1830 he published reports of the decisions of the superior court; and in 1816 he published two volumes, one French and one English, of A General Digest of the Acts of Legislatures of the Late Territory of Orleans and of the State of Louisiana. He won the name of the "father of Louisiana jurisprudence" and his work was of great assistance to Edward Livingston, Pierre Derbigny and Moreau Lislet in the Louisiana codification of 1821-1826. Martin's eyesight had begun to fail when he was seventy, and after 1836 he could no longer write opinions with his own hand. He died in New Orleans on the 11th of December 1846.

MARTIN, C.—MARTIN, L.

is a memoir by Henry A. Bullard in part ii. of B. F. French's Historical Collections of Louisiana (Philadelphia, 1850), and one by W. W. Howe in John F. Condon's edition of Martin's History of Louisiana (New Orleans, 1882).

MARTIN, HOMER DODGE (1836-1897). American artist, was born at Albany, New York, on the 28th of October 1836. A pupil for a short time of William Hart, his earlier work followed the lines of the Hudson River School. He was elected as associate of the National Academy of Design, New York, in 1868, and a full academician in 1874. During a trip to Europe in 1876 he was captivated by the Barbizon school, and from 1882 to 1886 he lived in France spending much of the time in Normandy. At Villerville he painted his "Harp of the Winds," now in the Metropolitan Museum of Art, New York. Among his important works are: "Westminster Hills," "Adirondack Scenery," "The Cinquefoile Church," "Sand Dunes," and "A Newport Landscape." Martin is generally spoken of as one of the great trio of American landscape artists, the other two being Inness and Wyant, and examples of his work are in most of the important American collections. He died at St. Paul, Minnesota, on the 2nd of February 1897.

MARTIN, JOHN (1789-1854). English painter, was born at Haydon Bridge, near Haxom, on the 10th of July 1789. He was apprenticed by his father to a coachbuilder to learn heraldic painting, but owing to a quarrel the indentures were cancelled, and he was placed under Bonifacio Musso, an Italian artist, father of the enamel painter Charles Musso. With his master Martin removed to London in 1806, where he married at the age of nineteen, and supported himself by giving drawing lessons, and by painting in water colours, and on china and glass. His leisure was occupied in the study of perspective and architecture. His first picture, "Sadak in Search of the Waters of Oblivion," was exhibited in the Royal Academy of 1812, and sold for fifty guineas. It was followed by the "Expulsion" (1813), "Paradise" (1813), "Clytie" (1814), and "Joshua" (1815). In 1821 he appeared his "Belshazzar's Feast," which excited much favourable and hostile comment, and was awarded a prize of £200 at the British Institution, where the Joshua had previously carried off a premium of £100. Then came the " Destruction of Herculaneum" (1822), the "Creation" (1824), the "Eve of the Deluge" (1841), and a series of other Biblical and imaginative subjects. In 1832-1833 Martin received £200 for drawing and engraving a fine series of designs to Milton, and with Westall he produced a set of Bible illustrations. He was also occupied with schemes for the design of the new Houses of Parliament, and published various pamphlets and plans dealing with the metropolitan water supply, sewage, dock and railway systems. During the last four years of his life he was engaged upon his large subjects of "The Judgment," the "Day of Wrath," and the "Plains of Heaven." He was attacked with paralysis while painting, and died in the Isle of Man on the 17th of February 1834.

MARTIN, LUTHER (1748-1826). American lawyer, was born in New Brunswick, New Jersey, on the 9th of February 1748. He graduated at the college of New Jersey (now Princeton University) at the head of a class of thirty-five in 1766, and immediately afterwards removed to Maryland, teaching at Queenstown in that colony until 1770, and being admitted to the bar in 1771. He practised law for a short time in Virginia, then returned to Maryland, and became recognized as the leader of the Maryland bar and as one of the ablest lawyers in the United States. From 1778 to 1805 he was attorney-general of Maryland; in 1814-1816 he was chief judge of the court of Oyer and Terminer for the city of Baltimore; and in 1818-1822 he was attorney-general of Maryland. He was one of Maryland's representatives in the Continental Congress in 1784-1785 and in the Constitutional Convention of 1787 at Philadelphia, but opposed the constitution and refused to affix his signature. He subsequently allied himself with the Federalists, and was an opponent of Thomas Jefferson, who in 1807 spoke of him as the "Federal Bull-Dog." His ability was shown in his famous defence of Judge Samuel Chase (q.v.) in the impeachment trial before the United States Senate in 1804-1805, and in his defence of Aaron
Martin, Sir T.—Martin of Troppau

Burr (q.v.) against the charge of treason in 1807. He has been described by the historian Henry Adams, writing of the Chase trial, as at that time the "most formidable of American advocates." Though he received a large income, he was so improvident that he was frequently in want, and on the 22nd of February 1822 the legislature of Maryland passed a remarkable resolution—the only one of the kind in American history—requiring every lawyer in the state to pay an annual licence fee of five dollars, to be handed over to trustees appointed "for the appropriation of the proceeds raised by virtue of this resolution to the use of Luther Martin." This resolution was rescinded on the 6th of February 1823. Martin died at the home of Aaron Burr in New York on the 10th of July 1826. In 1783 he had married a daughter of the Captain Michael Cresap (1742–1773), who was unjustly charged by Jefferson, in his Notes on the Virginia, with the murder of the family of the Indian chief, John Logan, and whom Martin defended in a pamphlet long out of print.

See the biographical sketch by Henry P. Goddard, Luther Martin, the Federal Bull-Dog (Baltimore, 1887), No. 24 of the "Peabody Fund Publications," of the Maryland Historical Society.

Martin, Sir Theodore (1816–1900), British author and translator, the son of a solicitor, was born at Edinburgh on the 16th of September 1816, and educated at the Royal High School and the University, from which he subsequently received the honorary degree of LL.D. He practised for some time as a solicitor in Edinburgh, but in 1846 went to London, where he became senior partner in the firm of Martin & Leslie, parliamentary agents. He early contributed to Fraser's Magazine and Tait's Magazine, under the signature of "Bon Gaultier," and in 1856, in conjunction with Professor Aytoun, he published the Book of Ballads under the same pseudonym. This work at once obtained popular favour. In 1858 he published a volume of translations of the Poems and Ballads of Goethe, and this was followed by a rendering of the Danish poet Henrik Hertz's lyric drama, King Rene's Daughter. The principal character in this drama, Iolanthe, was sustained by Helena Faucit (q.v.), who in 1851 became the author's wife. Martin's translations of Ohlenschläger's dramas, Correggio (1854) and Aladdin, or the Wonderful Lamp (1857), widened the fame of the Danish poet in England. In 1860 appeared Martin's metrical translation of the Odes of Horace; and in 1870 he wrote a volume on Horace for the series of "Ancient Classics for English Readers." In 1882 his Horatian labours were concluded by a translation of the poet's whole works, with a life and notes, in two volumes. A poetical translation of Catullus was published in 1861, followed a year later by a prose translation of Ovid's Metamorphoses, which was translated in 1863. The same translations of the Via Nova of Dante, and the first part of Goethe's Faust. A metrical translation of the second part of Faust appeared in 1866. Martin wrote a memoir of his friend Aytoun in 1867, and while engaged upon this work he was requested by Queen Victoria, to whom he was introduced by his friend Sir Arthur Helps, to undertake the Life of His Royal Highness the Prince Consort. The first volume of this well-known work was published in 1874. In 1878 Martin's translation of Heine's Poems and Ballads appeared. Two years later the Life of the Prince Consort was brought to a successful conclusion by the publication of the fifth volume. A knighthood was then conferred upon him. In the following November he was elected lord rector of the university of St Andrews. Martin's Life of Lord Lyndhurst, based upon papers furnished by the family, was published in 1883. In 1889 appeared The Song of the Bell, and other Translations from Schiller, Goethe, Uhland, and Others; in 1894 Madame Pia, a Tragedy, and three Other Dramas; a translation of Leopardi's poems in 1905; and in 1901 he published a biography of his wife. The kindly relations which subsisted between Queen Victoria and Sir Theodore Martin were continued after the completion of the Life of the prince consort up to the queen's death. Sir Theodore's account of these relations was privately printed in 1902, and, with King Edward's consent, for general publication in 1908. This little book, Queen Victoria as I knew her, throws a good deal of light on the Queen's character and private life. Sir Theodore Martin died on the 18th of August 1900.

Martin, William (1767–1810), English naturalist, the son of a hosier, was born at Mansfield, Nottinghamshire, in 1767. He studied drawing at an early age from James Bolton at Halifax, and gained from him a taste for the study of natural history. In 1805 he was appointed drawing master in the grammar school at Macclesfield. Meanwhile he cultivated his taste for natural history, and was in 1796 elected a fellow of the Linnaean Society. He is best known for his early works on British fossils, entitled Petrifacies derbiensia or Figures and Descriptions of Petrifactions collected in Derbyshire (1809); and Outlines of an Attempt to establish a Knowledge of Extraneous Fossils on Scientific Principles (1806). He died at Macclesfield on the 21st of May 1810.

Martin, Sir William Fanshawe (1801–1892), British admiral, son of Admiral of the Fleet Sir Thomas Byam Martin, comptroller of the navy, and grandson, on the mother's side, of Captain Robert Fanshawe, who commanded the "Namur" 90 in Rodney's victory of the 12th of April 1782, was born on the 5th of December 1801. Entering the navy at the age of twelve, his father's interest secured his rapid promotion: he was made a lieutenant on the 15th of December 1820; on the 8th of February 1823 he was promoted to be commander of the "Fly" sloop, his good service in which in support of the interests of British merchants at Callao secured his promotion as captain on the 5th of June 1824. He afterwards served in the Mediterranean and on the home station. In 1849–1852 he was commodore commanding the Channel squadron, and gave evidence of a remarkable aptitude for command. He was made rear-admiral in May 1853, and for the next four years was superintendent of Portsmouth dockyard. He was made vice-admiral in February 1858, and after a year as a lord of the admiralty, was appointed commander-in-chief in the Mediterranean. The discipline of the navy was then bad. It was a tradition sprung from the wholesale shipment of gaud-birds during the old war, that the men were to be treated without consideration; moreover the ships had been largely filled up with "bounty men" bought into the service with a £10 note without training. Out of this unpromising material Martin formed the fleet which was at that time the ideal of excellence. He had no war service, and, beyond the Italian disturbance of 1859–61, no opportunity for showing diplomatic ability. But his memory lives as that of the reformer of discipline and the originator of a comprehensive system of steam manœuvres. He became an admiral in November 1863, and on the 4th of December succeeded Sir Robert Napier as commander-in-chief. His last appointment was the command at Plymouth, 1866–1869, and in 1870 he was put on the retired list. In 1873 the G.C.B. was conferred on him, and in 1878 he was made rear-admiral. He died at Upton Grey, near Winchfield, on the 24th of March 1895. He was twice married, and left, besides daughters, one son, who succeeded to the baronetcy.

Martin of Troppau, or Martin the Pole (d. 1278), chronicler, was born at Troppau, and entered the order of St Dominic at Prague. Afterwards he went to Rome and became papal chaplain under Clement IV. and other popes. In 1278 Pope Nicholas III. appointed him archbishop of Gnesen, but he died at Bologna whilst proceeding to Poland to take up his new duties. Martin wrote some sermons and some commentaries on the canon law; but more important is his Chronicon pontificum et imperatorum, a history of the popes and emperors to 1277. Written at the request of Clement IV. the Chronicon is jejun and untrustworthy, and was mainly responsible for the currency of the legend of Pope Joan, and the one about the institution of seven electors by the pope. Nevertheless it enjoyed an extraordinary popularity and found many continuators; but its value to students arises solely from the fact that it was used by numerous chroniclers during the 14th, 15th and 16th centuries. In the 15th century it was translated into French, and as part of the Chronique martiniâne was often quoted by controversialists. It has also been translated into German, Italian and Bohemian.
The Latin text is printed, with introduction by L. Weiland, in Band XXII. of the *Monumenta Germanica historica* (Hanover and Berlin, 1826 seq.). See G. Waitz, H. Brossen and others in the *Neues Archiv der Gesellschaft für ältere deutsche Geschichte* (Hanover).—V. Weisbach, *Deutschlands Geschichtsquellen*, Band II. (Berlin, 1894); and A. Molinier, *Les Sources de l'histoire de France*, Tome IIII. (Paris, 1903).

**MARTIN**

1 (Fr. Martinet), the *Hirundo urbica* of Linnaeus and *Chelidon urbico* of modern ornithologists, a bird well known throughout Europe, including even Lapland, where it is abundant, retiring in winter to the south of Africa. It also inhabits the western part of Asia, and appears from time to time in large flocks in India. The martin (or house-martin, as it is often called, to distinguish it from the sand-martin) commonly reaches its summer quarters a few days later than the *Swallow* (q.v.), with which it is often confused in spite of the differences between them, the martin's white rump and lower parts being conspicuous as it flies or clings to its nest attached to houses. This nest, made of the same material as the swallow's, is, however, a more difficult structure to rear, and a week or more often occupies in laying its foundations—the builders clinging to the wall while depositing the mud of which it is composed. The base once fixed, the superstructure is often quickly added, till the whole takes the shape of the half or quarter of a hemisphere, and is finished with a lining of feathers mixed with a few bents or straws. The martin builds soon after its return, and a nest that has outlasted the winter is almost at once re-occupied. The bird usually in the course of the summer raises a second, or rarely a third, brood of offspring—though the latest broods often die in the nest, apparently through failure of food. What seems to be adults are observed in England every year so late as November, and sometimes within a few days of the winter solstice, but these late birds are almost certainly strangers.

The sand-martin, *Hirundo riparia* of Linnaeus and *Coltie riparia* of modern writers, differs much in appearance and habits from the former. Its smaller size, mouse-coloured upper surface and jerking flight distinguish it from the other British Hirun-
dinæa; but it is seldom discriminated, and, being the first of the family to return to its northern home, the so-called "early swallow" is nearly always of this species. Instead of the clay-built nest of the house-martin, this bird builds horizontal galleries in an escarpment. When beginning its excavation, it clings to the face of the bank, and with its bill loosen the earth, working from the centre outwards, and often hanging head downwards. The tunnel may extend to 4, 6, or even 9 ft. The gallery seems intended to be straight, but inequalities of the ground, and especially the meeting with stones, often causes it to take a sinuous course. At the end is formed a nest lined with a few grass-stalks and feathers. The sand-martin has several broods in the year, and is more regular than other *Hirundinæa* in its departure for the south. The kind of soil needed for its nesting habits makes it somewhat local, but no species of the order *Passeres* has a geographical range that can compare with this. In Europe it is found nearly to the North Cape, and thence to the Cape of Good Hope; in Asia, in many parts of India and South Africa to the Transvaal. In America its range extends (having due regard to the season) from Melville Island to Calçara in Brazil, and from Newfoundland to Alaska.

The purple martin of America, *Progne purpurea*, is a favourite in Canada and the United States. Naturally breeding in hollow trees, it readily adapts itself to the nest-boxes which are commonly set up for it; but its numbers are in some places and years diminished in a manner unexplained. The limits of its range in winter are not determined, chiefly owing to the differences of opinion as to the validity of certain supposed kindred species found in South America; but according to some authorities it reaches the border of Patagonia, while in summer it is known to inhabit lands within the Arctic Circle. The male is almost wholly of a glossy steel-blue, while the female is duller in colour above, and beneath of a brownish-grey.

Birds that may be called martins occur almost all over the world except in New Zealand, which is not regularly inhabited by any member of the family. The ordinary martin of Australia is the *Petrochelidon nigricans* of most ornithologists, and another and more beautiful form is the ariel or fairy-martin of the same country, *Petrochelidon ariel*. This last builds a bottle-shaped nest of mud, as does also the rock-martin of Europe, *Cotile rupestris*. The eggs of martins are from four to seven in number, and generally white, while those of swallows usually have brown, grey or lilac markings.

**MARTINEAU, HARRIET** (1802–1876), English writer, was born at Norwich, where her father was a manufacturer, on the 12th of June 1802. The family was of Huguenot extraction (see Martineau, James) and professed Unitarian views. The atmosphere of her home was industrious, intellectual and austere; she herself was clever, but weakly and unhappy; she had no sense of taste or smell, and moreover early grew deaf. At the age of fifteen the state of her health and nerves led to a prolonged visit to her father's sister, Mrs Kentish, who kept a school at Bristol. Here, in the companionship of amiable and talented people, her life became happier. Here, also, she fell under the influence of the Unitarian minister, Dr Lant Carpenter, from whose instructions, she says, she derived "an abominable spiritual rigidity and a truly respectable force of conscience strangely mingled together." From 1810 to 1830 she again resided chiefly at Norwich. About her twentieth year her deafness became confirmed. In 1821 she began to write anonymously for the *Monthly Repository*, a Unitarian periodical, and in 1823 she published *Devotional Exercises and Addresses, Prayers and Hymns*. In 1826 her father died, leaving a bare maintenance to his wife and daughters. His death had been preceded by that of his eldest son, and was shortly followed by that of a man to whom Harriet was engaged. Mrs Martineau and her daughters soon after lost all their means by the failure of the house where their money was placed. Harriet had to earn her living, and, being precluded by her deafness from teaching, took up authorship in earnest. Besides reviewing for the *Repository* she wrote stories (afterwards collected as *Traditions of Palestine*), gained in one year (1830) three essay-prizes of the Unitarian Association, and eked out her income by needlework. In 1831 she was seeking a publisher for a series of tales designed as *Illustrations of Political Economy*. After many failures she accepted disadvantageous terms from Charles Fox, to whom she was introduced by his brother, the editor of the *Repository*. The sale of the first of the series was immediate and enormous, the demand increased with each new number, and from that time her literary success was secured. In 1832 she moved to London, where she numbered among her acquaintance Hallam, Milman, Malthus, Monckton Milnes, Sydney Smith, Bulwer, and later Carlyle. Till 1834 she continued to be occupied with her political economy series and with a supplemental series of *Illustrations of Taxation*. Harriet's marriage, with the poet-law, came out about the same time. These tales, with direct, honest, aim without anyance of effort, and yet practically effective, display the characteristics of her author's style. In 1834, when the series was complete, Miss Martineau paid a long visit to America. Here her open adhesion to the Abolitionist party, then small and very unpopular, gave great offence, which was deepened by the publication, soon after her return, of *Society in America* (1837) and a *Retrospect of Western Travel* (1838). An article in the *Westminster Review*, "The Martyr Age of the United States," introduced English readers to the struggles of the Abolitionists. The American books were followed by a novel, *Deerbrook* (1839)—a story of middle-class country life. To the same period belong a few little handbooks, forming parts of a *Guide to Service*. The veracity of her *Maid of All Work* led to a widespread belief, which she regarded with some complacency, that she had once been a maid of all work herself.

In 1839, during a visit to the Continent, Miss Martineau's health broke down. She retired to solitary lodgings in Tyne-
mouth, and remained an invalid till 1844. Besides a novel, *The Hour and the Man* (1840), *Life in the Sickroom* (1844), and the *Playfellow* (1847), she published a series of tales for children containing some of her most popular work: *Settlers at Home, The Peasant and the Prince, Feats on the Fiord*, &c. During this illness she for a second time declined a pension on the civil list, fearing to compromise her political independence. Her letter on the subject was published, and some of her friends raised a small annuity for her soon after.

In 1844 Miss Martineau underwent a course of mesmerism, and in a few months was restored to health. She eventually published an account of her case, which had caused much discussion, in *sixteen Letters on Mesmerism*. On her recovery she removed to Ambleside, where she built herself "The Knoll," the house in which the greater part of her after life was spent. In 1845 she published three volumes of *Forest and Game Law Tales*. In 1846 she made a tour with some friends in Egypt, Palestine and Syria, and on her return published *Eastern Life, Present and Past* (1848). This work showed that as humanity passed through one after another of the world's historic religions, the consciousness of a personal deity and of Divine government became at each step more and more tangible and definite. The ultimate goal Miss Martineau believed to be philosophic atheism, but this belief she did not expressly declare. She published about this time *Household Education*, expounding the theory that freedom and rationality, rather than command and obedience, are the most effectual instruments of education. Her interest in schemes of instruction led her to start a series of lectures, addressed at first to the school children of Ambleside, but afterwards extended, at their own desire, to their elders. The subjects were sanitary principles and practice, the histories of England and North America, and the scenes of her Eastern travels. At the request of Charles Knight she wrote, in 1840, *The History of the Thirty Years' Peace, 1816-1846*—an excellent popular history written from the point of view of a "philosophical Radical," completed in twelve months.

In 1851 Miss Martineau edited a volume of *Letters on the Laws of Man's Nature and Development*. Its form is that of a correspondence between herself and H. G. Atkinson, and it expounds that doctrine of philosophical atheism to which Miss Martineau in *Eastern Life* had depicted the course of human belief as tending. The existence of a first cause is not denied, but is declared unknowable, and the authors, while regarded by others as denying it, certainly considered themselves to be affirming the doctrine of man's moral obligation. Atkinson was a zealous exponent of mesmerism, and the prominence given to the topics of mesmerism and clairvoyance heightened the general disapprobation of the book, which caused a lasting division between Miss Martineau and some of her friends.

She published a condensed English version of the *Philosophie Positive* (1853). To the *Daily News* she contributed regularly from 1852 to 1866. Her *Letters from Ireland*, written during a visit to that country in the summer of 1852, appeared in that paper. She was for many years a contributor to the *Westminster Review*, and was one of the little band of supporters whose pecuniary assistance in 1854 prevented its extinction or forced sale. In the early part of 1855 Miss Martineau found herself suffering from heart disease. She now began to write her autobiography, but her life, which she supposed to be so near its close, was prolonged for twenty years. She died at "The Knoll" on the 27th of June 1876.

She cultivated a tiny farm at Ambleside with success, and her poorer neighbours owed much to her. Her busy life bears the consistent impress of two leading characteristics—industry and sincerity. The verdict which she records on herself in the autobiographical sketch left to be published by the *Daily News* has been endorsed by posterity. She says—"Her original power was nothing more than was due to earnestness and intellectual clearness within a certain range. With small imaginative and suggestive powers, and therefore nothing approaching to genius, she could see clearly what she did see, and give a clear expression to what she had to say. In short, she could popularize while she could neither discover nor invent." Her judgment on large questions was clear and sound, and was always the judgment of a mind naturally preservative and Protestant.

See her *Autobiography, with Memorials by Maria Weston Chapman* (1877) and Mrs. Fenwick Miller, *Harrriet Martineau* (1884, "Eminent Women Series").

**MARTINEAU, JAMES** (1805-1900), English philosopher and divine, was born at Norwich on the 21st of April 1805, the seventh child of Thomas Martineau and Elizabeth Rankin, the sixth, his senior by almost three years, being his sister Harriet (see above). He was descended from Gaston Martineau, a Huguenot surgeon and refugee, who married in 1693 Marie Pierre, and settled soon afterwards in Norwich. His son and grandson—respectively the great-grandfather and grandfather of James Martineau—were surgeons in the same city, while his father was a manufacturer and merchant. James was educated at Norwich Grammar School under Edward Valpy, as good a scholar as his better-known brother Richard. But the boy proving too sensitive for the life of a public day school, was sent to Bristol to the private academy of Dr Lant Carpenter, under whom he studied for two years. On leaving he was apprenticed to a civil engineer at Derby, where he acquired "a store of exclusively scientific conceptions," but also experienced the hunger of mind which forced him to look to religion for satisfaction. Hence came his "conversion," and the sense of vocation for the ministry which impelled him in 1822 to enter Manchester College, then lodged at York. Here he "woke up to the interest of moral and metaphysical speculations." Of his teachers, Charles Welby, was, Martineau said, "a master of the true Lardner type, candid and catholic, simple and thorough, humanly fond indeed of the counsels of peace, but piously serving every bidding of sacred truth." "He never justified a prejudice; he never misdirected our admiration; he never hurt an innocent feeling or overbear a serious judgment; and he set up within us a standard of Christian scholarship to which it must ever exalt us to aspire." The other, the Rev. John Kenrick, he described as a man so learned as to be placed by Dean Stanley "in the same line with Blomfield and Thirlwall," and as "so far above the level of either vanity or dogmatism, that cynicism itself could not think of them in his presence." ⁴

On leaving the college in 1827 Martineau returned to Bristol to teach in the school of Lant Carpenter; but in the following year he was ordained for a Unitarian church in Dublin, whose senior minister was a relative of his own. But his career there was in 1832 suddenly cut short by difficulties growing out of the "Lancashire question," which had arisen out of the death of the senior minister fallen to him. He conceived it as "a religious monopoly" to which "the nation at large contributes," while "Presbyterians alone receive," and which placed him in "a relation to the state" so "seriously objectionable" as to be "impossible to hold." ³ The invidious distinction it drew between Presbyterians on the one hand, and Catholics, Friends, freethinking Christians, unbelievers and Jews on the other, who were compelled to support a ministry they "conscientiously disapproved," offended his always delicate conscience; while possibly the intellectual and ecclesiastical atmosphere of the city proved uncongenial to his liberal magnanimity. From Dublin he was called to Liverpool, and there for a quarter of a century he exercised extraordinary influence as a preacher, and achieved a high reputation as a writer in religious philosophy. In 1840 he was appointed professor of mental and moral philosophy and political economy in Manchester New College, the seminary in which he had himself been educated, and which had now removed from York to the city after which it was named. This position he held for forty-five years. In 1853 the college removed to London, and four years later he followed it thither. In 1858 he was called to

"Martineau's "Letter to the Dissenting Congregation of Eustace Street" (Dublin).
occupy the pulpit of Little Portland Street chapel in London, which he did at first for two years in conjunction with the Rev. J. J. Tayler, who was also his colleague in the college, and then for twelve years alone. In 1866 the chair of the philosophy of mind and logic in University College, London, fell vacant, and Martineau became a candidate. But potent opposition was offered to the appointment of a minister of religion, and the chair went to George Croom Robertson—then an untired man—between whom and Martineau a cordial friendship came to exist. In 1885 he retired, full of years and honours, from the principalship of the college he had so long served and adorned. Martineau, who was in his youth denied the benefit of a university education, yet in his age found famous universities eager to confer upon him their highest distinctions. He was made LL.D. of Harvard in 1872, S.T.D. of Leiden in 1874, D.D. of Edinburgh in 1884, D.C.L. of Oxford in 1888 and D.Litt. of Dublin in 1891. He died in London on the 11th of January 1900.

The life of Martineau was so essentially the life of the thinker, and so typical of the century in which he lived and the society within which he moved, that he can be better understood through his spoken mind than through his outward history. He was a man happy in his ancestry; he inherited the dignity, the reserve, the keen and vivid intellect, and the picturesque imagination of the French Hugenot, though they came to him chastened and purified by generations of Puritan discipline exercised under the gravest ecclesiastical disabilities, and of culture maintained in the face of exclusion from academic privileges. He had the sweet and patient temper which knew how to live, unrepining and unsoured, in the midst of the most watchful persecution, public and private; and it is wonderful how rarely he used his splendid rhetoric for the purposes of invective against the spirit and policy from which he must have suffered deeply, while, it may be added, he never hid an innuendo under a metaphor or a trope. He was fundamentally too much a man of strong convictions to be correctly described as open-minded, for in nature ever determined any man's faith, it was his; the root of his whole intellectual life, which was too deep to be disturbed by any superficial change in his philosophy, being the feeling for God. He has, indeed, described in graphic terms the greatest of the more superficial changes he underwent; how he "carried into logical and ethical problems the maxims and postulates of physical knowledge," and had moved within the narrow lines drawn by the philosophical instructions of the class-room "interpreting human phenomena by the analogy of external nature," how he served in willing captivity "the 'essential' and 'necessary' mode of thought," even though "shocked" by the dogmatism and acrid humour of "certain distinguished representatives" and how in a period of "second education" at Berlin, "mainly under the admirable guidance of Professor Trendelenburg," he experienced a "new intellectual birth" which "was essentially the gift of fresh conceptions, the unsealing of hidden openings of self-consciousness, with unmeasured corridors and sacred halls behind; and, once gained, was more or less available throughout the history of philosophy, and lifted the darkness from the pages of Kant and even Hegel." But though this momentous change of view illuminated his old beliefs and helped him to re-interpret and re-articulate them, it made him no more of a theist than he had been before. And as his theism was, so was his religion and his philosophy. Certainly it was true of him, in a far higher degree than of John Henry Newman, that the being of God and himself were to his mind two absolutely self-luminous truths—though both his God and his self were almost infinitely remote from Newman's. And as these truths were self-evident, so the religion he deduced from them was sufficient, not only for his own moral and intellectual nature, but also for man as he conceived him, for history as he knew it, and society as he saw it.

We may, alternatively, describe Martineau's religion as his applied philosophy or his philosophy as his explicated religion, and both as the expression of his singularly fine ethical and reverent nature. But to understand these in their mutual and explanatory relations it will be necessary to exhibit the conditions under which his thought grew into consistency and system. His main function, as a religious writer, was to define or try life a preacher even more emphatically than a teacher. In all he said and all he thought he had the preacher's end in view. He was, indeed, no mere orator or speaker to multitudes. He addressed a comparatively small and select circle, a congregation of thoughtful and devout men, who cultivated thought and love in God and whose beliefs were limited to the simplest and sublimest truths. He felt the majesty of these truths to be the greater that they so represented to him not only the most fundamental of human beliefs, but also all the truths to be read in the Bible; and he believed with his whole reason. Hence the beliefs he preached were never to him mere speculative ideas, but rather the ultimate realities of being and thought, the final truths as to the character and ways of God, and the spiritual law of life, the guidance and the regulation of life. And so he became a positive religious teacher by virtue of the very ideas that made the words of the Hebrew prophets so potent and sublime. But he did more than interpret to his age the significance of man's ultimate theistic beliefs, he gave them vitality by reading them through the consciousness of Jesus Christ. His religion was what he conceived the personal religion of Jesus to have been; and He was to him more a person to be imitated than an authority to be obeyed, rather an ideal to be realised than a being.

Martineau's mental qualities fitted him to fulfil these high interpretative functions. He had the imagination that invested with personal being and ethical qualities the most abstruse notions. To him the Gospels became a story of history; he became the presence as well as the origin and illumination of the vision of God; time was an arena where the divine hand guided and the divine will reigned. And though he did not believe in the Incarnation, yet he held deity to be in a sense human in its nature. For him the highest of his innumerable clarities, after a sort divine; man underwent an apotheosis, and all life was touched with the dignity and the grace which it owed to its source. The 19th century had no more reverent thinker than Martineau; the awe of the Eternal was the very atmosphere that he breathed, and in his connexion with the compassion of one whose thoughts were full of God.

To his function as a preacher we owe some of his most characteristic and stimulating works, especially the discourses by which he may be said to have won his way to wide and influential recognition—Endeavours after the Christian Life, 1st series, 1843; 2nd series, 1847; Hours of Thought, 1st series, 1876; 2nd series, 1879; the various hymn-books he issued at Dublin in 1831, at Liverpool in 1840, in London, 1873, and with Dew, Presbyterian in 1876. He was the dean of his period, and it was through the influence of his vocation that he freely selected and assiduously laboured to fulfil two more external influences helped to shape Martineau's mind and define his problem and his work; the awakening of English thought to the reality of the problem of the origin of man and the new and higher opportunities offered for their discussion in the periodical press. The questions which lived in the earlier and more formative period of his life concerned mainly the idea of the church, the historical interpretation of the documents which described the beginning of the Christian church and the person and work of its founder; but those most alive in his later and more mature time chiefly related to the philosophy of religion and ethics.

In one respect Martineau was singularly happy; he just escaped the activities and, on the whole, the strain of the controversy. When his ministry began its fires were slowly dying down, though the embers still glowed. We feel its presence in his earliest notable work, The Rationale of Religious Experience, 1836; and may there see the right and in which his logic to narrow premises, the tenacity with which it clung to a limited literal supernaturalism which it had no philosophy to justify, and so could not believe without historical and verbal authority. This traces his chief contention in the discovery and illustration, while it caused vehement discussion when the book appeared, was yet not so much characteristic of the man as of the school in which he had been trained, that "in no intelligible sense can any one who denies that the supernatural origin of the religion of Christ be termed 'Christian' with which it clung as a "name of praise," but simply as a "designation of belief." He censured the German rationalists "for having preferred, by convulsive efforts of interpretation, to compress the memoirs of Christ and His apostles into a system to be built up on the destruction of the operation of miracle on the one hand, or proclaim their abandonment of Christianity on the other." The echoes of the dying controversy are thus distinct and not very distant in this book, though his pages illustrate with evident unassailability under the burden of inherited beliefs, and his inability to reconcile them with his new standpoint and accepted principles, a curious forecast of his later development, while in its positive terms and, from the whole, the strain of the controversy of his later dialectic. Nor did the sound of the ancient controversy ever cease to be audible to him. In 1839 he sprang

1 Types of Ethical Theory, i. pp. vii. —ix. 2 Ibid. p. xiii.
to the defence of Unitarian doctrine, which had been assailed by certain Liverpool clergymen, of whom Fielding Ould was the most active and Hugh McNeil the most famous. As his share in the controversy, Martineau published five discourses, in which he discussed, "the Bible as the great autobiography of mankind," "the nature from which the doctrine of the incarnation, the history of Christ, "Vicarious Redemption," "Evil," and "Christianity without Priest and without Ritual." He remained to the end a keen and vigilant apologist of the school in which he had begun his career, though written he became more and more a disciple of the sceptic, no alternative could be found for the New Testament which might withstand the criticism of the historians, and a more drastic criticism of sacred history. Blanco White, "the rationalist A'Kempis," who had dared to appear as "a religious sceptic in God's presence," had found a biographer and interpreter in him. The arguments more or less from the English Church men with whom he had both personal and religious sympathy rose—Whately, of whom he said, "We know no living writer who has proved so little and disproved so much"; and Thomas Arnold, "a man who could be a hero without romance"; F. D. Maurice, whose character, marked by religious realism, sought in the past the witness to eternal truths, the manifestation by time-samples of infinite realities and unchanging relations; and Charles Kingsley, "a great teacher," though one "certain to be resisted in his present state of mind," who declared his belief in the entire overthrow of all dogmas, and a more drastic criticism of sacred history. "The man who could be a hero without romance," F. D. Maurice, whose character, marked by religious realism, was so much in common—influenced him; while Herbert Spencer in England and Comte in France afforded the antithesis needful to the dialectic of comparison. He had been a disciple of the German philosophy, especially the criticism of Baur and the Tübingen school, which affected profoundly his construction of Christian history. And these were strengthened by French influences, notably those of Renan and the Strassburg theologians. The defence of the Church, and the new scientific way of looking at nature and her creative methods, compelled him to rethink and reformulate his theistic principles and conclusions, especially as to the forms under which the relation of God to the world and His action within it could be understood. Under the impulse of these various sides Martineau's mind moved and moved, and as they successively rose he promptly, by appreciation or criticism, responded to the dialectical issues which they raised.

In these quarters the periodical press supplied him with the opportunity of taking an effective part. At first his literary activity was limited to sectional publications, and he addressed his public, now as editor and now as leading contributor, in the Westminster Review, the Christian Reformer, the Westminster and the National Review. Later, especially when scientific speculation had made the theistic problem urgent, he was a frequent contributor to the literary monthlies. And when in 1890 he began to gather together the miscellaneous essays and papers written during a period of sixty years, he expressed the hope that, though "they could lay no claim to logical consistency," they might yet show "the varying complexity of their thought some intelligible moral continuity," leading in the end to a view of life more coherent and less defective than was presented at the beginning. And though it is a proud as well as a modest hope, no one could call it unjustified. For his essays are fine examples of permanent literature appearing in an ephemeral medium, and represent work done at the very time of their production, and the distinction of their own time. There is hardly a name or a movement in the religious history of the century in which he did not touch and illuminate. It was in this form that he criticized the "atheistic philosophy," the "science of man," the "atheism," the "religion of nature," and she never forgave his criticism. But his course was always singularly independent, and, though one of the most affectionate and most sensitive of men, yet it was his fortune to be so fastidious in thought and so conscientious in judgment as often to give offence or create alarm in those he deeply respected or tenderly loved.

The theological and philosophical discussions which thus appeared he later described as the "theatrical" which gradually prepared the way for the more systematic expositions of the Types of Ethical

Theory and The Study of Religion, and, in some measure, of The Seat of Authority in Religion. These books expressed his mature thought, and may be said to contain, in what he conceived as a final form, the speculative achievements of his life. They appeared respectively in 1885 and 1889, and dealt with the Christian model of sacrifice to be performed by a man who had passed his eightieth year. Their literary and speculative qualities are indeed exceptionally brilliant; they are splendid in form, elaborate in argument, cogent yet reverent, keen while fearless in criticism. But they have also more and more the mark of a man who had thought much as well as spoken and written often on the themes he discusses, and who had finally put his material together in haste at a time when he had lost, if not its dialectic vigour, yet its power of sustained argument. Nevertheless, he has been accustomed to amplify the single stages of his argument that he had found how much they needed to be reduced to scale and to be built into an organic whole. In the first of these books his nomenclature, the schemes, the problems, the conclusions are so put into the "unpsychological," "idiospsychological," and the "hetero-psychological," incapable of historical justifica tion; his exposition of single ethical systems is, though always interesting and suggestive, and in many cases inadequate, being governed by dialectical exigencies rather than historical order and perspective. The second of the above books his idea of religion is somewhat of an anarchism; as he himself confessed, he "used the word in the sense which it invariably bore half a century ago," as denoting "the power which is controlling the world, which is carrying things to an end, and which is, in a sense, responsible for the universe and holding moral relations with mankind." As thus used, it was a term which governed the problems of speculative theology rather than those connected with the historical origins, the development, and the progressive revelation of religion. It is thus applied to the actual contents of the two books, we are bound to confess that they constitute a wonderfully cogent and persuasive theistic argument. That argument may be described as a criticism of man as such, he being judged according to his own worked out purposes, his natural relations, and his within the universe; it is thus a criticism of moral and ethical reason, and of the questions which are now to the front. These criticisms mean that his most elaborate discussions came forty years too late, for they were concerned with problems which agitated the middle rather than the end of the last century, with the first, and not the second, part of the theistic issue which he raised. For the ethical argument, and the psychological factor in the ethical factor, he gives an adequate account, and a critical account, of them, but he falls short of the actual contents of the two books, we are bound to confess that they constitute a wonderfully cogent and persuasive theistic argument. That argument may be described as a criticism of man as a moral being, and a criticism of moral and ethical reason, and of the questions which are now to the front. These criticisms mean that his most elaborate discussions came forty years too late, for they were concerned with problems which agitated the middle rather than the end of the last century, with the first, and not the second, part of the theistic issue which he raised. For the ethical argument, and the psychological factor in the ethical factor, he gives an adequate account, and a critical account, of them, but he falls short of the

...the matrix of the great religious thought and experience of the ages, the basis of all the great ethical and moral systems of the world; and in his later books, and especially in the Theology of the Moral, he was more and more a critic of them, and a critic of the world as we know it. In the first of these books his nomenclature, the schemes, the problems, the conclusions are so put into the "unpsychological," "idiospsychological," and the "hetero-psychological," incapable of historical justifica...
MARTINET, a military term (more generally used in a disparaging than in a complimentary sense) implying a strict disciplinarian or drill-master. The term originated in the French army about the middle of Louis XIV.'s reign, and was derived from Jean Martinet (d. 1672), who as lieutenant-colonel of the King's regiment of foot and inspector-general of infantry drilled and trained that arm in the model regular army created by Louis and Louvois between 1660 and 1670. Martinet seems also to have introduced the copper pontoons with which Louis bridged the Rhine in 1672. He was killed, as a marshal de camp, at the siege of Duisburg in the same year, being accidentally shot by his own artillery while leading the infantry assault. His death, and that of the Swiss captain Soury by the same discharge gave rise to a bon mot, typical of the polite ingratitude of the age, that Duisburg had only cost the king a martin and a mouse. The "martin" as a matter of fact shares with Vauban and other professional soldiers of Louis XIV. the glory of having made the French army the first and best regular army in Europe. Great nobles, such as Turenne, Condé and Luxemburg, led this army and inspired it, but their fame has obscured that of the men who made it manageable and efficient. It was about this time that the soldier of fortune, who joined a regiment with his own arms and equipment and had learned his trade by varied experience, began to give place to the soldier regularly enlisted as a recruit in permanent regiments and trained by his own officers. The consequence of this was the introduction of a uniform, or nearly uniform system of drill and training, which in all essentials has endured to the present day. Thus Martinet was the forerunner of Leopold of Dessau and Frederick William, just as Jean Jacques de Foulires, the organizer of the cavalry, who was forced into an untimely charge at Seneffe (1674) by a brutal traitor, was the precursor of James Martineau (1900); A. W. Jackson, James Martineau, a Biography and a Study (Boston, 1900); H. Sidgwick, Lectures on the Ethics of Green, Spencer and Martineau (1902); and J. Hunt, Religious Thought in England in the 19th Century. (A. M. F.)

MARTINEZ DE LA ROSA, FRANCISCO DE PAULA (1789-1862), Spanish statesman and dramatist, was born on the 10th of March 1789 at Granada, and educated at the university there. He won popularity with a series of epigrams on local celebrities published under the title of El Cementerio de momo. During the struggle against Napoleon he took the patriotic side, was elected deputy, and at Cadiz produced his first play, Lo que puede un empleado, a prose comedy in the manner of the younger Moratin. La Viuda de Padilla (1841), a tragedy modelled upon Alberi, was less acceptable to the Spanish public. Meanwhile the author became more and more engulfed in politics, and in 1814 was banished to Africa, where he remained till 1820, when he was suddenly recalled and appointed prime minister. During the next three years he was the most unpopular man in Spain; denounced as a revolutionary by the Conservatives and as a reactionary by the Liberals, he alienated the sympathies of all parties, and his rhetoric earned for him the contemptuous nickname of Rosita la Pastadera. Exiled in 1823, he took refuge in Paris, where he issued his Obras literarias (1827), including his Arte poética, in which he exaggerated the literary theories already promulgated by Luís Martín. Returning to Spain in 1831, he became prime minister on the death of Ferdinand VII., but proved incapable of coping with the insurrectionary movement and resigned in 1834. He was ambassador at Paris in 1839-1840 and at Rome in 1842-1843, joined the Conservative party, held many important offices, and was president of congress and director of the Spanish academy at the time of his death, which took place at Madrid on the 7th of February 1862. As a statesman, Martínez de la Rosa never rose above mediocrity. It was his misfortune to be in place without real power, to struggle against a turbulent pseudo-democratic movement promoted by unscrupulous soldiers, and to contend with the intrigues of the king, the court camarilla and the clergy. But circumstances which hampered him in politics favoured his career in literature. He was not a great natural force; his early plays and poems are influenced by Moratín, and exudes an imperious, pseudo-democratic style, which is inflated and unattractive and is overloaded with matter which cannot be regarded as historical. At the beginning of
and end of each chapter occur puzzle-canons, wherein the primary part or parts alone are given, and the reader has to discover the canon that fixes the period and the interval at which the response is to enter. Some of these are exceedingly difficult, but Cherubini solved the whole of them. The Stagg is a learned and valuable work, containing an important collection of examples from the best masters of the old Italian and Spanish schools, with excellent explanatory notes. It treats chiefly of the tonalities of the plain chant and church condemnations. Cherubini was the author of several controversial works, Martini drew up a *Dictionary of Ancient Musical Terms*, which appeared in the second volume of G. B. Doni's *Works*; he also published a treatise on *The Theory of Numbers as applied to Music*. His celebrated canons, published in London, about 1800, edited by Pio Ciancuchini, show him to have had a strong sense of musical humour.

**Martini, Simone** (1283-1344), Siennese painter, called also Simone di Martino, and more commonly, but not correctly, Simon Memmi,1 was born in 1283. He followed the manner of painting proper to his native Siena, as improved by Duccio, which is essentially different from the style of Giotto and his school, and the idea that Simone was himself a pupil of Giotto is therefore wide of the mark. The Siennese style is less natural, dignified and reserved than the Florentine; it has less of impression, has more tendency to pietyism, and is marked by exaggerations which are partly related to the obsolence Byzantine manner, and partly seem to forebode certain peculiarities of the fully developed art which we find prevalent in Michelangelo. Simone, in especial, tended to an excessive and rather affected tenderness in his female figures; he was more successful in single figures and in portraits than in large compositions of incident. He finished with scrupulous minuteness, and was elaborate in decorations of patterning, gilding, &c.

The first known fresco of Simone is the vast one which he executed in the hall of the Palazzo Pubblico in Siena—the "Madonna Enthroned, with the Infant," and a number of angels and saints; its date is 1315, at which time he was already an artist of importance in Italy. In S. Lorenzo, at Naples he painted a life-sized picture of King Robert crowned by his brother Lewis, bishop of Toulouse; this also is extant, but much damaged. In 1320 he painted for the high altar of the church of S. Caterina in Pisa the Virgin and Child between six saints; above are archangels, apostles and other figures. The compartmented portions of this work are now dispersed, some of them being in the academy of Siena. Towards 1321 he executed for the church of S. Domenico in Orvieto a picture of the bishop of Savona kneeling before the Madonna attended by saints, now in the Fabbriceria of the cathedral. Certain frescoes in Assisi in the chapel of San Martino, representing the life of that saint, ascribed by Vasari to Puccio Capanna, are now, upon internal evidence, assigned to Simone. He painted also a fresco of the baptism of Christ in the same edifice, figures of the Virgin and eight saints. In 1328 he produced for the sala del consilio in Siena a striking equestrian portrait of the victorious general Guidorico Fogliani de' Ricci.

Simone had married in 1324 Giovanna, the daughter of Memmo (Guglielmo) di Filippuccio. Her brother, named Lippo Memmi, was also a painter, and was frequently associated with Simone in his work; and this is the only reason why Simone has come down to us with the family-name Memmi. They painted together in 1333 the "Annunciation" which is now in the Uffizi gallery. Simone kept a bottega (or shop), undertaking any ornamental work, and his gains were large. In 1339 he settled at the papal court in Avignon, where he made the acquaintance of Dante, to whom he dedicated a poem and a portrait of his lady, which gave occasion for two of Petrarch's sonnets, in which Simone is eulogized. He also illustrated for the poet a copy of the commentary of Servius upon Virgil, now preserved in the Ambrosian library of Milan. He was largely employed in the decorations of the papal buildings in Avignon, and several of his works still remain—in the cathedral, in the hall of the consistory, and, in the two chapels of the palace, the stories of the Baptist, and of Stephen and other saints. One of his latest productions (1342) is the picture of "Christ Found by his Parents in the Temple," now in the Liverpool Gallery. Simone died in Avignon in July 1344.

Some of the works with which Simone's name and fame have been generally identified are not now regarded as his. Such are the compositions, in the Campo Santo of Pisa, from the legend of S. Ranieri, and the frescoes in the church of the Cappelle degli Spagnuoli, in S. Maria Novella, Florence, representing the Triumph of Religion through the work of the Dominican order.

**Martineque**, an island of the West Indies, belonging to the chain of the Lesser Antilles, and constituting a French colony, between the British islands of Dominica and St. Lucia, 23° S. of the one and 20° N. of the other, about 14° 40' N., 61° W. Its length is 40 m., its greatest width 21 m.; and the area comprises 360 sq. m. A cluster of volcanic mountains in the north, a small range in the south, and a line of lower heights between them, form the backbone of the island. Its deep ravines and precipitous escarpments are reduced in appearance to gentle undulations by the drapery of the forests. The massif of Mont Pelé in the north is the culminating point of the island (4430 ft.); that of Carbet is little inferior (3903 ft.), but the mountains in the south are much lower. Mont Pelé is notorious for an appalling eruption in May 1902.

Of the numerous streams which traverse the few miles of country between the watershed and the sea (the longest radiating from Mount Carbet), about seventy-five are of considerable size, and in the rainy season become deep and often destructive torrents. On the north-west and north the coast is elevated and bold; and similarly on the south, where a lateral range, branching from the backbone of the island, forms a blunt peninsula bounding the low-shouldered western bay of Martinique. On the south, another peninsula, called Caravelle, projects from the middle part of the east coast, and south of this the coast is low and fretted, with many islets and cays lying off it. Coral reefs occur especially in this locality. Plains, most of which are and extensive in the south, occupy about one-third of the total area of the island.

The mean annual temperature is 80° F. in the coast region, the monthly mean for June being 83°, and that for January 77°. Of the annual rainfall of 87 in. of August, the heaviest share (113 in.), though the rainy season extends from June to October; March, the driest month, has 37. Martineque enjoys a marked immunity from hurricanes. The low coastal districts are not very much affected; but the interior is much less favored, and occasional sanatoriums in the forest region at an elevation of about 1500 ft., where the average temperature is some 10° F. lower than that already quoted. The north winds which prevail from November to March are cooler and dry; those from the south (July to October) are damp and warm. From March to June easternly winds are prevalent.

The population increased from 162,861 in 1878 to 175,863 in 1888 and 203,781 in 1901. In 1902 the great eruption of Mont Pelé occurred, and in 1903 the population was only 182,024. The bulk of the population consists of Creole negroes and half-classes of various grades, ranging from the "Saccatra," who has retained hardly any trace of Caucasian blood, to the so-called "Sangmelé," with only a suspicion of negro mixturity. The capital of the Island is Fort de France, on the west-coast bay of the same name, with a fine harbour defended by three forts, and a total length of 18 m. The chief of the foreign population are, on the west coast Lamentin, on the same bay as the capital, and on the east coast Le Francois and Le Robert. The colony is administered by a governor and a general council, and returns a senator and two deputies. There are elective municipal councils. The chief product is sugar, and some coffee, cocoa, tobacco and oranges. The island is served by British, French and American steamship lines, and local communications are carried on by small coasting steamers and by subsidized mail coaches, as there are excellent roads. In 1905 the total value of the exports, consisting mainly of sugar, rum and cocoa, was £275,450. France taking by far the greater part, while imports were valued at £569,294, of which rather more than one-half by value came from France, the United States of America being the next principal importing country. In 1903,
the year following the eruption of Mont Pelé, exports were valued at $604,163.

Martinique, the name of which may be derived from a native form Madiana or Martinino, was probably discovered by Columbus on the 13th of June 1502; although by some authorities its discovery is placed in 1493. It was at that time inhabited by Caribs who had expelled or incorporated an older stock. It was not until the 25th of June 1635 that possession was taken of the island in the name of the French Compagnie des Îles d’Amérique. Actual settlement was carried out in the same year by Pierre Belain, Sieur d’Esnambac, captain-general of the island of St Christopher. In 1637 his nephew Dyel Duperquet (d. 1658) became captain-general of the colony, now numbering seven hundred men, and subsequently obtained the seigneurie of the island by purchase from the company under the authority of the king of France. In 1654 welcome was given to three hundred Jews expelled from Brazil, and by 1658 there were at least five thousand people exclusive of the Caribs, who were soon after exterminated. Purchased by the French government from Duperquet’s children for 120,000 livres, Martinique was assigned to the West India Company, but in 1674 it became part of the royal domain. The habitants (French landholders) at first devoted themselves to the cultivation of cotton and tobacco; but in 1650 sugar plantations were begun, and in 1723 the coffee plant was introduced. Slave labour having been introduced at an early period of the occupation, there were 60,000 blacks in the island by 1736. This slavery was abolished in 1806. Martinique had a full share of wars. In early days the Caribs were not brought under subjection without severe struggles. In 1666 and 1667 the island was attacked by the British without success, and hostilities were terminated by the treaty of Breda. The Dutch made similar attempts in 1674, and the British again attacked the island in 1693. Captured by Rodney in 1762, Martinique was next year restored to the French; but after the conquest by Sir John Jervis and Sir Charles Grey in 1793 it was retained for eight years; and, seized again in 1809, it was not surrendered till 1814. The island was the birth-place of the Empress Josephine.

Martinique has suffered from occasional severe storms, as in 1767, when 1600 persons perished, and M. de la Pagerie, father of the Empress Josephine, was practically ruined, and in 1839, 1851 and 1903, when much damage was done to the sugar crop. Earthquakes have also been frequent, but the most terrible natural disaster was the eruption of Mont Pelé in 1902, by which the town of St Pierre, formerly the chief commercial centre of the island, was destroyed. During the earlier months of the year various manifestations of volcanic activity had occurred; on the 25th of April there was a heavy fall of ashes, and on the 2nd and 3rd of May a heavy eruption destroyed extensive sugar plantations north of St Pierre, and caused a loss of some 150 lives. A few days later the news that the Soufrière in St Vincent was in eruption reassured the inhabitants of St Pierre, as it was supposed that this outbreak might relieve the volcano of Pelé. But on the 8th of May the final catastrophe came without warning, a mass of fire, compared to a flaming whirlwind, swept over St Pierre, destroying the ships in the harbour, among which, however, one, the “Roddam” of Scrutton, escaped. A fall of molten lava and ashes followed the flames, accompanied by dense gases which asphyxiated those who had thus far escaped. The total loss of life was estimated at 40,000. Consternation was caused not only in the West Indies, but in France and throughout the world, and at first it was seriously suggested that the island should be evacuated, but no countenance was lent to this proposal by the French government. Relief measures were undertaken and voluntary subscriptions raised. The material losses were estimated at £4,000,000; but, besides St Pierre, only one-tenth of the island had been devastated, and although during July there was further volcanic activity, causing more destruction, the economic situation recovered more rapidly than was expected.

Anderson (November 20, 1902), who investigated the eruptions on behalf of the Royal Society; cf. T. Anderson, “Recent Volcanic Eruptions in the West Indies,” in Geographical Journal, vol. xxi. (1903).

MARTINSBURG, a town and the county-seat of Berkeley county, West Virginia, U.S.A., about 75 m. W.N.W. of Washington, D.C. Pop. (1890) 7266; (1900) 7564 (678 negroes); (1910) 10,608. It is served by the Baltimore & Ohio and the Cumberland Valley railways; the former has repair shops here. It lies in the Lower Shenandoah Valley at the foot of Little North mountain, in the midst of a fruit-growing region, peaches and apples being the principal crops. Slate and limestone also abound in the vicinity. The town has a fine Federal Building and a King’s Daughters’ hospital. There are grain elevators, and various manufactories, including hosiery, woolen goods, dressed lumber, &c. Martinsburg owns its waterworks, the supply being derived from a neighbouring spring. A town was laid out here a short time before the War of Independence and was named Martinstown in honour of Colonel Thomas Bryan Martin, a nephew of Thomas, Lord Fairfax (1676-1758); in 1778 it was incorporated under its present name. During the Civil War Martinsburg was occupied by several different Union and Confederate forces.

MARTINS FERRY, a city of Belmont county, Ohio, U.S.A., on the Ohio River, nearly opposite Wheeling, West Virginia. Pop. (1890) 6250; (1900) 7760, including 1033 foreign-born and 252 negroes; (1910), 9133. It is served by the Pennsylvania (Cleveland & Pittsburgh Division), the Baltimore & Ohio, and the Wheeling & Lake Erie (Wabash System) railways, and by several steamboat lines. The city is situated on two plateaus; the lower is occupied chiefly by factories, the upper by dwellings. Coal mining and manufacturing are the principal industries; among factory products are iron, steel, tin, stoves, machinery and glassware. The municipality owns and operates the waterworks and an electric-lighting plant. A settlement was attempted here in 1785, but was abandoned on account of trouble with the Indians. In 1795 a town was laid out by Absalom Martin and was called Jefferson, but this, too, was abandoned, on
account of its not being made the county-seat. The town was laid out again in 1835 by Ebenezer Mart (son of Absalom Martin) and was called Martinsville; the present name was substituted a few years later. The Martins and other pioneers are buried in Walnut Grove Cemetery within the city limits. Martins Ferry was incorporated as a town in 1865 and chartered as a city in 1885.

MARTINUZZI, GEORGE [GYÖRGY UTIEŠENOVICH] (1482–1551), Hungarian statesman, who, since he usually signed himself ‘Frater Georgius,’ is known in Hungarian history as FRATER GYÖRGY or simply THE FRATER, was born at Kamichi in Croatia, the son of Gregory Utiešenovic, a Croatian gentleman. His mother was a Martuzzi, a Venetian patrician family. From his eighth to his twentieth year he was attached to the court of Corvinus; subsequently, entering the service of the Zapolya family, he saw something of warfare under John Zapolya but, tiring of a military life, he entered the Paulician Order in his twenty-eighth year. His historical career began when his old patron Zapolya, now king of Hungary, forced to fly before his successful rival Ferdinand, afterwards the emperor Ferdinand I., sent him on a diplomatic mission to Hungary. It was due to his tact and ability that John recovered Buda (1520), and henceforth the Frater was a confidential counsellor to the king. In 1534 he became bishop of Grosswardein; in 1538 he concluded with Austria the peace of Grosswardein, whereby the royal title and the greater part of Hungary were conceded to Zapolya. King John left the Frater the guardian of his infant son John Sigismund, who was proclaimed and crowned king of Hungary, the Frater acting as regent. He frustrated all the attempts of the queen mother, Isabella, to bring in the Austrians, and when, in 1541, an Austrian army appeared beneath the walls of Buda, he arrested the queen and applied to the Porte for help. On the 28th of August 1541, the Frater died homage to the sultan, but during his absence with the baby king in the Turkish camp, the grand vizier took Buda by subterfuge. Then only the Frater recognized the necessity of a composition with both Austria and Turkey. He attained it by the treaty of Gyula (Dec. 29, 1541), whereby western Hungary fell to Ferdinand, while Transylvania, as an independent principality under Turkish suzerainty, reverted to John Sigismund. It included, besides Transylvania proper, many Hungarian counties on both sides of the Theiss, and the important city of Kassa. The Frater was a masterful diplomat, and preserved his mission intact by cultivating amicable relations with Austria without offending the Porte. It was a difficult policy, but succeeded brilliantly for a time. In 1545, encouraged by the growing unpopularity of Ferdinand, owing to his incapacity to defend Hungary against the Turks, the Frater was tempted to unite Austrian Hungary to Transylvania and procure the election of John Sigismund as the national king. But recognizing that this was impossible, he aimed at an alliance with Ferdinand on terms of relative equality, and to this system he adhered till his death. Queen Isabella, who hated the Frater and constantly opposed him, complained of him to the sultan, who commanded that either the traitor himself or his head should be sent to Constantinople (1550). A combination was then formed against him of the queen, the hospodars of Moldavia and Wallachia and the Turks; but the Frater shut the queen up in Gyula-Fehervár, drove the hospodars out of Transylvania, defeated the Turks at Dèva, and finally compelled Isabella to accept a composition with Austria very profitable to her family and to Transylvania, at the same time soothing the rage of the sultan by flatteries and gifts. Thus Ferdinand, a masterful politician, preserved his mission intact by the diet of Kolozsvár in August 1551. The Frater retained the governorship of Transylvania, and was subsequently consecrated archbishop of Esztergom and received the red hat. Thus Hungary was once more reunited, but the inability of Ferdinand to defend it against the Turks, as promised, forced the Frater, for the common safety, to resume the payment of tribute to the Porte in December 1551. Unfortunately, the Turks no longer trusted a diplomatist they could not understand, while Ferdinand suspected of an intention to secure Hungary for himself. When the Turks (in 1551) took Csanád and other places, the Frater and the imperial generals Castaldo and Pallavicini combined their forces against the common foe but, when the Frater privately endeavoured to mediate between the Turks and the Hungarians, Castaldo represented him to Ferdinand as a traitor, and asked permission to kill him if necessary. The Frater's secretary Marco Aurelio Ferrari was hired, and stabbed his master from behind at the castle of Alvinczy while reading a letter, on the 18th of December 1551; but the cardinal, though in his sixty-ninth year, fought for his life, and was only despatched with the aid of Pallavicini and a band of bravos. Ferdinand took the responsibility of the murder on himself. He sent to Julius III. an accusation of treason against the Frater in eighty-seven articles, and after long hesitation, and hearing one hundred and sixteen witnesses, the pope exonerated Ferdinand of blame.

See A. Bechel, Histoire du ministère du cardinal Martinusin (Paris, 1715); O. M. Utiešenovich, Lebensgeschichte des Cardinals Georg Utiešenovich (Vienna, 1881); Codex epistolae Praefatis Georgii 1535–1551, ed. A. Károlyi (Budapest, 1881). But the most vivid description of the Frater is to be found in M. Jokai's fine historical romance, Brother George (Hung.), (Budapest, 1893). (R. N. B.)

MARTIUS, CARL FRIEDRICH PHILIPP VON (1794–1868), German botanist and traveller, was born on the 17th of April 1794 at Erdlangen, where he graduated M. D. in 1814, publishing as his thesis a critical catalogue of plants in the botanic garden of the university. He afterwards devoted himself to botanical study, and in 1817 he and J. B. von Spix were sent to Brazil by the king of Bavaria. They travelled from Rio de Janeiro through several of the southern and eastern provinces of Brazil, and ascended the river Amazon to Tabatinga, as well as some of its larger affluents. On his return to Europe in 1820 he was appointed conservator of the botanic garden at Munich, and in 1826 professor of botany in the university there, and held both offices till 1864. He devoted his chief attention to the flora of Brazil, and in addition to numerous short papers he published the Nova Genera et Species Plantarum Brasiliensium (1823–1853, 3 vols.) and Icones selectae Plantarum Cryptogamicarum Brasiliensium (1827), both works being finely illustrated. An account of his travels in Brazil appeared in 3 vols. 4to, 1823–1833, with an atlas of plates, but probably the work by which he is best known is his Historia Flamarum (1825–1850) in 3 large folio volumes, of which one exists at Quedlinburg and another in Munich. In 1840 he began the Flora Brasiliensis, with the assistance of the most distinguished European botanists, who undertook monographs of the various orders. Its publication was continued after his death under the editorship of A. Eichler (1839–1887) until 1887, and subsequently of Ignaz von Urban. He also edited several works on the zoological collections made in Brazil by Spix, after the death of the latter in 1826. On the outbreak of potato disease in Europe he investigated it and published his observations in 1842. He also published works and short papers on the aborigines of Brazil, on their civil and social condition, on their past and probable future, on their diseases and medicines, and on the languages of the various tribes, especially the Tupi. He died at Munich on the 13th of December 1868.

MARTOS, CHRISTINO (1830–1893), Spanish politician, was born at Granada on the 13th of September 1830. He was educated there and at Madrid University, where his Radicalism soon got him into trouble, and he narrowly escaped being expelled for his share in student riots and other political demonstrations. He graduated in 1851 as licenciado in law and was admitted to the Bar at Granada in 1853. He distinguished himself as a journalist on El Tribuno. He joined O'Donnell and Espartero in 1854 against a revolutionary cabinet, and shortly afterwards turned against O'Donnell to assist the Democrats and Progressists under Prim, Rivero, Castelar, and Sagasta in the unsuccessful movements of 1866, and was obliged to go abroad. His political career had not prevented Martos from rising into note at the bar, where he was successful for forty years. After remaining abroad three years, he returned to Spain to take his seat in the Cortes of 1869 after the revolution.
Martos—Martyr

of 1868. Throughout the revolutionary period he represented in cabinets with Prim, Serrano and Ruiz Zorrilla, and lastly under King Amadeus, the advanced Radical tendency of the men who wanted to give Spain a democratic monarchy. After the abdication of Amadeus of Savoy, Martos played a prominent part in the proclamation of the federal republic, in the struggle between the executive of that republic and the permanent committee of the Cortes, backed by the generals and militia, who nearly put an end to the executive and republic in April 1873. When the republicans triumphed Martos retired into exile, and soon afterwards into private life. He reappeared for a few months after General Pavia’s coup d’état in January 1874, to join a coalition cabinet formed by Marshal Serrano, with Sagasta and Ulloa. Martos returned to the Bar in May 1874, and quietly looked on when the restoration took place at the end of that year. He stuck to his democratic ideals for some years, even going to Biarritz in 1881 to be present at a republican congress presided over by Ruiz Zorrilla. Shortly afterwards Martos joined the dynastic Left organized by Marshal Serrano, General Lopez Dominguez, and Moret, Becerra, Balagueur, and other quondam revolutionaries. He sat in several parliaments of the reign of Alphonso XIII. When the regency quitted Cristina, joined the dynastic Liberals under Sagasta, and gave Sagasta not a little trouble when the latter allowed him to preside over the House of Deputies. Having failed to form a rival party against Sagasta, Martos subsided into political insignificance, despite his great talent as an orator and debater, and died in Madrid on the 16th of January 1893.

Martos, a town of southern Spain, in the province of Jaen, 16 m. W.S.W. of Jaen, by the Jaen-Lucena railway. Pop. (1900), 17,078. Martos is situated on an outlying western peak of the Jabalcuz mountains, which is surrounded by a ruined castle and overlooks the plain of Andalusia. In the neighbourhood are two sulphurous springs with bathing establishments. The local trade is almost exclusively agricultural.

Martos perhaps stands or near the site of the Tucci of Potlomy, which was fortified and renamed Colonia Augusta Gemilla by the Romans. By Ferdinand III, it was taken from the Moors in 1225, and given to the knights of Calatrava; it was here that the brothers Carvajal, commanders of the order, were in 1312 executed by command of Ferdinand IV. Before their death they summoned Ferdinand to meet them within thirty days at the judgment-seat of God. Ferdinand died a month later and thus received the popular name of el Emplazado—"the Sumonado."

Martyn, Henry (1781–1812), English missionary to India, was born on the 18th of February 1781, at Truro, Cornwall. His father, John Martyn, was a “captain” or mine-agent at Gwennap. The lad was educated at Truro grammar school under Dr Cardew, entered St John’s College, Cambridge, in the autumn of 1797, and was senior wrangler and first Smith’s prizeman in 1801. In 1802 he was chosen a fellow of his college. He had intended to go to the bar, but in the October term of 1802 he changed to hear Charles Simeon speaking of the good done in India by a single missionary, William Carey, and some time afterwards he read the life of David Brainerd, the apostle of the Indians of North America. He resolved, accordingly, to become a Christian missionary. On the 22nd of October, 1803, he ordained deacon at Ely, and afterwards priest, and served as Simeon’s curate at the church of Holy Trinity, taking charge of the neighbouring parish of Lolverth. He was about to offer his services to the Church Missionary Society, when a disaster in Cornwall deprived him and his unmarried sister of the provision their father had made for them, and rendered it necessary that he should obtain a salary that would support her as well as himself. He accordingly obtained a chaplaincy under the East India Company and left for India on the 4th of July 1805. For some months he was stationed at Aldeen, near Serampur; in October 1806 he proceeded to Dinapur, where he was soon able to conduct worship among the natives in the vernacular, and established schools. In April 1809 he was transferred to Cawnpore, where he preached in his own compound, in spite of interruptions and threats. He occupied himself in linguistic study, and had already, during his residence at Dinapur, been engaged in revising the sheets of his Hindostani version of the New Testament. He now translated the whole of the New Testament into Hindi also, and into Persian twice. He translated the Psalms into Persian, the Gospels into Judaeo-Persic, and the Prayer-book into Hindostani, in spite of ill-health and "the pride, pedantry and fury of his chief munshi Sabat." Ordered by the doctors to take a sea voyage, he obtained leave to go to Persia and correct his Persian New Testament, whence he wished to go to Arabia, and there compose an Arabic version. Accordingly, on the 1st of October 1810, having seen his work at Cawnpore crowned on the previous day by the opening of a church, he left for Calcutta, whence he sailed on the 7th of January 1811, for Bombay, which he reached on his thirtieth birthday. From Bombay he set out for Bushire, bearing letters from Sir John Malcolm to men of position there, as also at Shiraz and Isfahan. After an exhausting journey from the coast he reached Shiraz, and was soon plunged into discussion with the disputants of all classes, "Sufi, Mahommedan, Jew, and Jewish-Mahommedan, even Armenian, all anxious to test their powers of argument with the first English priest who had visited them."

Having made an unsuccessful journey to Tabriz to present the New Testament with the royal assent to the Shah, he returned to Bombay, suffering from fever, and after a temporary recovery, had to seek a change of climate. On the 12th of September 1812, he started with two Armenian servants, crossed the Araxes, rode from Tabriz to Erivan, from Erivan to Kars, from Kars to Erzerum, from Erzerum to Chiflik, urged on from place to place by a thoughtless Tatar guide, and, though the plague was raging at Tokat (near Eski-Shehr in Asia Minor), he was compelled by prostration to stop there. On the 6th of October he died. Macaulay’s youthful lines, written early in 1813, testify to the impression made by his career.

His Journals and Letters were published by Samuel Wilberforce in 1837. See also Lives by John Sargent (1819; new ed. 1885), and G. Smith (1892); and The Church Quarterly Review (Oct. 1881).

Martyr, John (1669–1768), English botanist, was born in London on the 12th of September 1669. Originally intended for a business career, he abandoned it in favour of medical and botanical studies. He was one of the founders (with J. Dillen and others) and the secretary of a botanical society which met for a few years in the Rainbow Coffee-house, Watling Street; he also started the Grub Street Journal, a weekly satirical review, which lasted from 1730 to 1737. In 1732 he was appointed professor of botany in Cambridge University, but, finding little encouragement and hampered by lack of appliances, he soon discontinued lecturing. He retained his professorship, however, till 1762, when he resigned in favour of his son Thomas (1735–1825), author of Flora rustic (1792–1794). Although he had not taken a medical degree, he long practised as a physician at Chelsea, where he died on the 29th of January 1768. His reputation chiefly rests upon his Historia plantarum rario-rum (1728–1737), and his translation, with valuable agricultural and botanical notes, of the Eclogues (1749) and Georgics (1741) of Virgil. On resigning the botanical chair at Cambridge he presented the university with a number of his botanical specimens and books.

See memoir by Thomas Martyn in Memoirs of John Martyn and Thomas Martyn, by G. C. Gorham (1830).

Martyr (Gr. μάρτυς or μαρτυρον), a word meaning literally "witness" and often used in that sense in the New Testament e.g. Matt. xviii. 16; Mark xiv. 63. During the conflict between Paganism and Christianity when many Christians "testified" to the truth of their convictions by sacrificing their lives, the word assumed its modern technical sense. The beginnings of this use are to be seen in such passages as Acts xxii. 20; Rev. ii. 13, xiii. 6. During the first three centuries the fortitude of these "witnesses" won the admiration of their brethren. Ardent spirits craved the martyr's crown, and to confess Christ in persecution was to attain a glory inferior only to that won by those who actually died. Confessors were visited in prison, martyrs' graves were scenes of pilgrimage, and the day on which
MARTYROLOGY—MARVELL, ANDREW

they suffered was celebrated as the birthday of their glory. Martyrology was the most popular literature in the early Church. While the honour paid to martyrdom was a great support to early Christian faith, it was often misused by cruel and exaggerating historians. It is thought that martyrdom would alone for sin, and imprisoned confessors not only to the Churches commands which were regarded almost as inspired utterances, but granted pardons in rash profusion to those who had been excommunicated by the regular clergy, a practice which caused Cyprian and his fellow bishops much difficulty. The zeal of Ignatius (c. 115), who begs the Roman Church to do nothing to avert from him the martyr’s death, was natural enough in a spiritual knight-errant, but with others in later days, especially in Phrygia and North Africa, the passion became artificial. Fanatics sought death by insulting the magistrates or by breaking idols, and in their enthusiasm for martyrdom became self-centred and forgetful of their normal duty. None the less it is true that these men and women endured torments, often unthinkable in their cruelty, and death rather than abandon their faith. The same phenomena have been witnessed, not only in the conflicts within the Church that marked the 13th to the 16th centuries, but in the different mission fields, and particularly in Madagascar and China.

MARTYROLOGY, a catalogue or list of martyrs, or, more exactly, of saints, arranged in the order of their anniversaries. This is the now accepted meaning in the Latin Church. In the Greek Church the nearest equivalent to the martyrology is the Synaxarium (q.v.). As regards form, we should distinguish between simple martyrologies, which consist merely of an enumeration of names, and historical martyrologies, which also include stories or biographical details. As regards documents, the most important distinction is between local and general martyrologies. The former give a list of the festivals of some particular Church; the latter are the result of a combination of several local martyrologies. We may add certain compilations of a factitious character, to which the name of martyrology is given by analogy, e.g. the Martyrologium universale of Châtelain (1709). As types of local martyrologies we may quote that of Rome, formed from the Deposito martyrum and the Deposito episcoporum of the chronograph of 354; the Gothic calendar of Ultilla’s Bible, the calendar of Carthage published by Mabillon, the calendar of fasts and vigils of the Church of Tours, going back as far as Bishop Perpetus (d. 490), and preserved in the Historia francorum (xi. 31) of Gregory of Tours. The Syrian martyrology discovered by Wright (Journal of Sacred Literature, 1866) gives the idea of a general martyrology. The most important ancient martyrology preserved to the present day is the compilation falsely attributed to St Jerome, which in its present form goes back to the end of the 6th century. It is the result of the combination of a general martyrology of the Eastern Churches, a local martyrology of the Church of Rome, some general martyrologies of Italy and Africa, and a series of local martyrologies of Gaul. The task of critics is to distinguish between its various constituent elements. Unfortunately, this document has reached us in a lamentable condition. The proper names are distorted, repeated or misplaced, and in many places the text is so corrupt that it is impossible to understand it. With the exception of a few traces of borrowings from the Passions of the martyrs, the compilation is in the form of a simple martyrology. Of the best-known historical martyrologies the oldest are those which go under the name of Bede and of Florus (Auctus sanctorum Martii, vol. ii.); of Wandelbert, a monk of Prüm (842); of Rhabanus Maurus (c. 845); of Ado (d. 872); of Notker (896); and of Wolfhard (c. 896 v. Aselectaollandiana, xvii. 11). The most famous is that of Usuard (c. 875), on which the Roman martyrology was based. The first edition of the Roman martyrology appeared in Rome in 1583. The third edition, which appeared in 1604, was approved by Gregory XIII, who imposed the Roman martyrology upon the whole Church. In 1586 Baronius published his annotated edition, which in spite of its omissions and inaccuracies is a mine of valuable information.

The chief works on the martyrologies are those of Rosswein, who in 1618 published at Rome the martyrology of Ado (also edition of Giorgi, Rome, 1745); of Sollерius, to whom we owe a learned edition of Usuard (Acta sanctorum Juni, vols. vi. and vii.); and of Fiorentini, who published in 1668 an annotated edition of the Martyrologium of St Jerome. The critical edition of the latter by J. B. de Rossi and Mgr. L. Duchesne, was published in 1894, in vol. ii. of the Acta sanctorum Novembris. The historical martyrologies taken as a whole have been studied by Dom Quentin (1908). There are also numerous editions of calendars or martyrologies of less universal use and comment. Mention ought to be made of the famous calendar of Naples, commented on by Mazocchi (Naples, 1744) and Sabbatini (Naples, 1744). See C. de Smedt, Introduzione ad historia ecclesiasticom ed ai medesimi commenzi (Gandavi, 1888); A. Schell, Die Martyrologien, ihre Geschichte und der Wert (Berlin, 1907); H. Delchartre, Le Pèlerinage des martyrologes, in Anecdotaollandiana, xxvi. 78-99 (1907); H. Quentin, Les Martyrologes historiques du moyen âge (Paris, 1908).

MARULLUS, MICHAEL TARCHANIOTA (d. 1500), Greek scholar, poet, and soldier, was born at Constantinople. In 1453, when the Turks captured Constantinople, he was taken to Ancona in Italy, where he became the friend and pupil of J. J. Pontanus, with whom his name is associated by Ariosto (Orl. Pur. xix. vii.). He received his education at Florence, where he obtained the patronage of Lorenzo de’ Medici. He was the author of epigrams and hymni naturalis, in which he happily imitated Lucretius. He had no special work of translation, but he did a very creditable piece of scholarship, and it is understood that he was planning some great work when he was drowned, on the 10th of April 1506, in the river Cenica near Volterra. He was a bitter enemy of Politian, whose successful rival he had been in the affections of the beautiful and learned Alessandra Scala. He is remembered chiefly for the brilliant emendations on Lucretius which he left unpublished; these were used for the Juntine edition (Munro’s Lucretius, Introduction).

The hymns, some of the epigrams, and a fragment, De Principium institutione, were reprinted in Paris by C. M. Sathas in Documentos inédito referidos à historia de la Grécia ao moyen Âge, vol. vii. (1888).

MARUM, MARTIN VAN (1570-1837), Dutch man of science, was born on the 26th of March 1730 at Groningen, where he graduated in medicine and philosophy. He began to practise medicine at Haarlem, but devoted himself mainly to lecturing on physical subjects. He became secretary of the scientific society of the city, and in 1743 he managed an institute which he had established for the promotion of one of the most noted in Europe. He was also entrusted with the care of the collection left to Haarlem by P. Teylar van der Hult (1702-1778). His name is not associated with any discovery of the first order, but his researches (especially in connexion with electricity) were remarkable for their number and variety. He died at Haarlem on the 26th of December 1837.

MARUTS, in Hindu mythology, storm-gods. Their numbers vary in the different scriptures, usually three or thirty-six. In the Vedas they are called the sons of Rudra. They are the companions of Indra, and associated with him in the wielding of thunderbolts, sometimes as his equals, sometimes as his servants. They are armed with golden weapons and lightnings. They split drought (Vritra) and bring rain, and cause earthquakes. Various myths surround their birth. A derivative word, Maruti or Maroti, is the popular name throughout the Deccan for Hanuman (g.v.).

MARVELL, ANDREW (1621-1678), English poet and satirist, son of Andrew Marvell and his wife Anne Pease, was born at the rectory house, Winestead, in the Holderness division of Yorkshire, on the 31st of March 1621. In 1624 his father exchanged the living of Winestead for the mastership of Hull grammar school. He also became lecturer at Holy Trinity Church and
MARVELL, ANDREW

master of the Charterhouse in the same town. Thomas Fuller (Worthies of England, ed. 1811, i. 165) describes him as "a most excellent preacher." The younger Marvell was educated at Hull school until his thirteenth year, when he matriculated on the 14th of December 1633 (according to a doubtful statement in Wood's Athen. Oxon.) at Trinity College, Cambridge. It is related by his early biographer, Thomas Cooke, that he was induced by some Jesuit priests to leave the university. After some months he was discovered by his father in a bookseller's shop in London, and returned to Cambridge. He contributed two poems to the Musa cantabrigiensis in 1637, and in the following year he received a scholarship at Trinity College, and took his B.A. degree in 1639. His father was drowned in 1640 while crossing the Humber in company with the daughter of a Mrs Skinner, almost certainly connected with the Cyrack Skinner to whom two of Milton's sonnets are addressed. It is said that Mrs Skinner adopted Marvell and provided for him at her death. The Conclusion Book of Trinity College, Cambridge, registers the degree (Sept. 24, 1641) that he with others should be excluded from further advantages from the college either because they were married, or did not attend their days or "acts." He had previously accompanied his father on the Continent, visiting Holland, France, Italy and Spain. In Rome he met Richard Flecknoe, whom he satirized in the amusing verses on "Flecknoe, an English priest at Rome."

Although Marvell ranks as a great Puritan poet his sympathies were at first with Charles I., and in the lines on " Tom May's Death " he found no words too strong to express his scorn for the historian of the Long Parliament. He himself was no partisan, but had a passion for law and order. He acquired, accordingly, in the strong rule of Cromwell, but in his famous "Horatian Ode upon Cromwell's Return from Ireland" (1650) he inserts a tribute to the courage and dignity of Charles I., which forms the best-known section of the poem. In 1650 he became tutor to Lord Fairfax's daughter Mary, afterwards duchess of Buckingham, then in her twelfth year. During his life with the Fairfaxes at Nunappleton, Yorkshire, he wrote the poems "Upon the Hill and Grove at Billborough" and "On Appleton House."

Doubtless the other poems on country life, and his exquisite "garden poetry" may be referred to this period. "Clorinda and Damon" and "The Nymph complaining for the Death of her Faun" are good examples of the beauty and simplicity of much of this early verse. But he had affinities with John Donne and the metaphysical poets, and could be obscure on occasion.

Marvell was acquainted with Milton probably through their common friends, the Skinners, and in February 1653 Milton sent him with a letter to the lord president of the council, John Bradshaw, recommending him as "a man of singular desert for the state to make use of," and suggesting his appointment as assistant to himself in his duties as foreign secretary. The appointment was, however, given at the time to Philip Meadows, and Marvell became tutor to Cromwell's ward, William Dutton. In 1653 he was established with his pupil at Eton in the house of John Oxenbridge, then a fellow of the college, but formerly a minister in the Bermudas. No doubt the well-known verses, "Bermudas," were inspired by intercourse with the Bermudas. At Eton he enjoyed the society of John Hales, then living in retirement. He was employed by Milton in 1654 to convey to Bradshaw a copy of the Defensio secunda, and the letter to Milton in which he describes the reception of the gift is preserved. When the secretarship again fell vacant in 1657 Marvell was appointed, and retained the appointment until the accession of Charles II. During this period he wrote many political poems,

1 There is an allusion to this escape addressed by another anxious parent to the elder Marvell in the Hull Corporation Records (No. 498) [see Grosart, i. xxviii.]. The document is without address or date and is difficult to authenticate.

2 This poem has been highly praised by Goldwin Smith (T. H. Ward's English Poets, ii. 383 (1880)). It was first printed, so far as we know, in 1776, and the only external testimony to Marvell's authorship is the statement of Captain Thompson, who had included many poems by other writers in his edition of Marvell, that this ode was in poet's own handwriting. The internal evidence in favour of Marvell may, however, be accepted as conclusive.

all of them displaying admiration for Cromwell. His "Poem upon the Death of his late Highness the Lord Protector" has been unfavourably compared to Edmund Waller's "Panegyrick," but Marvell's poem is inspired with affection.

Marvell's connexion with Hull had been strengthened by the marriages of his sisters with persons of local importance, and in January 1659 he was elected to represent the borough in parliament. He was re-elected in 1660, again in 1661, and continued to represent the town until his death. According to Milton's nephew, Edward Phillips, the poet owed his safety at the Restoration largely to the efforts of Marvell, who "made a considerable party for him" in the House of Commons. From 1663 to 1665 he acted as secretary to Charles Howard, 1st earl of Carlisle, on his difficult and unsuccessful embassy to Muscovy, Sweden, and Denmark; and this is the only official post he filled during the reign of Charles. With the exception of this absence, for which he had leave from his constituents, and of shorter intervals of travel on private business which took him to Holland, Marvell was constant in his parliamentary attendance to the day of his death. He seldom spoke in the House, but his parliamentary speeches established him, both on the Continent and in England, as an excellent man of affairs, and looked after the special interests of the port of Hull. He was a member of the corporation of Trinity House, both in London and Hull, and became a younger warden of the London Trinity House. His correspondence with his constituents, from 1660 to 1678, some 400 letters in all, printed by Dr Grosart (Complete Works, vol. ii.), forms a source of information all the more valuable because by a resolution passed at the Restoration the publication of the proceedings of the House without leave was forbidden. He made it a point of duty to write at each post—that is, every two or three days—both on local interests and on all matters of public interest. The discreet reserve of these letters, natural at a time when the post office was a favourite source of information to the government, contrasts curiously with the freedom of the few private letters which state opinions as well as facts. Marvell's constituents, in their turn, were not unmindful of their member. He makes frequent references to their presents, usually of Hull ale and salmon, and he regularly drew from them the wages of a member, six-and-eighthree a day during session.

The development of Marvell's political opinions may be traced in the satirical verse he published during the reign of Charles II., and in his private letters. With all his admiration for Cromwell he had retained his sympathies with the royal house, and had loyally accepted the Restoration. In 1667 the Dutch fleet sailed up the Thames, and Marvell expressed his wrath at the gross mismanagement of public affairs in "Last Instructions to a Painter," a satire which was published as a broadside and of course remained anonymous. Edmund Waller had published in 1665 a gratulatory poem on the duke of York's victory in that year over the Dutch as "Instructions to a Painter for the drawing up and posture of his Majesty's forces at sea." A similar form was adopted in Sir John Denham's four satirical "Directions to a Painter," and Marvell writes on the same model. His indignation was well grounded, but he had no scruples in the choice of the weapons he employed in his warfare against the corruption of the court, which he paints even blacker than do contemporary memoir writers; and his satire often descends to the level of the lampoon. The most inexcusable of his scandalous verses are perhaps those on the duchess of York. In the same year he attacked Lord Clarendon, evidently hoping that with the removal of the "betrayer of England and Flanders" matters would improve. But in 1672 when he wrote his "Poem in the Stocks-Market" he had no illusions left about Charles, whom he describes as too often "purchased and sold," though he concludes with "Yet we'd rather have him than his bigoted brother." "An Historical Poem," "Advice to a Painter," and "Britannia and Raleigh" urge the same advice in grave language. In the last-named poem, probably written early in 1674, Raleigh pleads that "tis god-like good to save a fallen king," but Britannia has at length decided that the tyrant cannot be divided from the Stuart, and proposes to reform the state.
on the republican model of Venice. These and other equally bold satires were probably handed round in MS., or secretly printed, and it was not until after the Revolution that they were collected with those of other writers in Poems on Affairs of State (3 pts., 1689; 4 pts., 1703-1707). Marvell's controversial prose writings are wittier than his verse satires, and are free from the scurrility which defaces the "Last Instructions to a Painter."

A short and brilliant example of his irony is "His Majesty's Most Gracious Speech to both Houses of Parliament" (printed in Grosart, ii. 431 seq.), in which Charles is made to take the house to the friendliest confidence on his domestic affairs.

Marvell was among the masters of Jonathan Swift, who, in the "Apology" prefixed to the Tale of a Tub, wrote that his answer to Samuel Parker could be still read with pleasure, although the pamphlets that provoked it were long since forgotten. Parker had written a Discourse of Ecclesiastical Polity (1670) and other polemics against Dissenters, to which Marvell replied in The Rehearsal Transposed (2 pts., 1672 and 1673). The book contains some passages of dignified eloquence, and some coarse vituperation, but the prevailing tone is that of grave and ironical banter of Parker's "plainspoken" style. Parker was imprisoned, and Bishop Burnet (Hist. of His Own Time, ed. 1823, i. 451), "by the liveliest droll of the age, who writ in a burlesque strain, but with so peculiar and entertaining a conduct, that, from the king down to the tradesman, his books were read with great pleasure."

He certainly humbled Parker, but whether this effect extended, as Burnet asserts, to the whole party, is doubtful. Parker had intimated that Milton had a share in the first part of Marvell's reply. This Marvell emphatically denied (Grosart, iii. 498). He points out that Parker had, like Milton, profited by the royal clemency, and that he had first met him at Milton's house. He takes the opportunity to praise Milton's "great learning and sharpness of wit," and to the second edition of Paradise Lost (1674) he contributed some verses of just and eloquent praise.

His Mr Smirke, or the Divine in Mode . . . (1676) was a defence of Herbert Croft, bishop of Hereford, against the criticisms of Dr Francis Turner, master of St John's College, Cambridge. A far more important work was An Account of the Growth of Popery and Arbitrary Government in England, more particularly from the Long Proclamation of Parliament (1677). This pamphlet was written in the same outspoken tone as the verse satires, and brought against the court the indictment of nursing designs to establish absolute monarchy and the Roman Catholic religion at the same time. A reward was offered for the author, whose identity was evidently suspected, and it is said that Marvell was in danger of assassination. He died on the 16th of August 1678 in consequence of an overdose of an opiate taken during an attack of ague. He was buried in the church of St Giles-in-the-Fields, London. Joint administration of his estate was granted to one of his creditors, and to his widow, Mary Marvell, of whom we have no previous mention.

As a humorist, and as a great "parliament man," no name is of more interest to a student of the reign of Charles II. than that of Marvell. He had friends among the republican thinkers of the times. Aubrey says that he was intimate with James Harrington, the author of Oceana, and he was probably a member of the "Rota" club. In the heyday of political infamy, he, a necessary man, obliged to accept wages from his consciences by his political virtue unspotted, and he stood throughout his career as the champion of moderate and tolerant measures. There is a story that his old schoolfellow, Danby, was sent by the king to offer the incorruptible poet a place at court and a gift of £1000, which Marvell refused with the words: "I live here to serve my constituents: the ministry may seek men for their purpose; I am not one." When self-indulgence was the ordinary habit of town life, Marvell was a temperate man. His personal appearance is described by John Aubrey: "He was of a middling stature, pretty strong set, roundish faced, cherry cheeked, hazel eyed, brown haired. In his conversation he was modest and of very few words." (Lives of Eminent Persons, printed in Letters . . . in the 17th and 18th Centuries, 1813).

Among Marvell's works is also a Defence of John Hope on God's Presence . . . (1678), and among the spurious works fathered on him are: A Seasonable Argument . . . for a new Parliament (1677), A Seasonable Question and a Useful Answer . . . (1679), A Letter from a Parliament Man . . . (1675), and a translation of Stuevius (1672). Marvell's satires were no doubt first printed as broadsides, but very few are still extant in that form. Such of his poems as were printed during his lifetime appeared in collections of other satires.

The Constables, or Political Satires (1681), were followed by some Miscellaneous Poems (1681), edited by his wife, Mary Marvell. The political satires were printed as A Collection of Poems on Affairs of State, by A — M — I, Esq. and other Eminent Wits (1689), with the second and third parts in the same year. The works of Andrew Marvell and prose and verse of Andrew Marvell, M.P. (4 vols., 1879-1885) forms part of his "Fuller Worthies' Library." See also the admirable edition of the Poems and Satires of Andrew Marvell. . . (2 vols., 1892) in the "Muse's Library," where a full bibliography of his works and of the commentaries on them is provided. Two Prose and some Satires of Andrew Marvell (ed. Edward Wright, 1904), and Andrew Marvell (1905), by Augustine Birrell in the "English Men of Letters" series.

**MARX, HEINRICH KARL** (1818-1883), German socialist, and head of the International Working Men's Association, was born on the 5th of May 1818 in Trèves (Rhenish Prussia). His father, a Jewish lawyer, in 1824 went over to Christianity, and he and his whole family were baptized as Christian Protestants. The son went to the high grammar school at Trèves, and from 1835 to the universities of Bonn and Berlin. He studied first law, then history and philosophy, and in 1841 took the degree of doctor of philosophy. In Berlin he had close intimacy with the most prominent representatives of the young Hegelians—the brothers Bruno and Edgar Bauer and their circle, the so-called "Freien." He at first intended to settle as a lecturer at Bonn University, but his Radical views made a university career out of the question, and he accepted work on a Radical paper, the Rheinische Zeitung, which expounded the ideas of the most advanced section of the Rhenish Radical bourgeoisie. In October 1842 he became one of the editors of this paper, which, however, after an incessant struggle with press censors, was suppressed in the beginning of 1843. In the summer of this year Marx married Jenny von Westphalen, the daughter of a high government official. Through her mother Jenny von Westphalen was a lineal descendant of the earl of Argyle, who was beheaded under James II. She was a most faithful companion to Marx during all the vicissitudes of his career, and died on the 2nd of December 1851; he outliving her only fifteen months.

Already in the Rheinische Zeitung some socialist voices had been audible, couched in a somewhat philosophical strain. Marx, though not accepting these views, refused to criticize them until he had studied the question thoroughly. For this purpose he went in the autumn of 1843 to Paris, where the socialist movement was then at its intellectual zenith, and where he, together with Arnold Ruge, the well-known literary leader of Radical Hegelianism, was to edit a review, the Deutsch-französische Journal, whose chief contributors were Karl Marx and Frederick Engels.

It contained two articles by Marx—a criticism of Bruno Bauer's treatment of the Jewish question, and an introduction to a criticism of Hegel's philosophy of the law. The first concluded that the social emancipation of the Jews could only be achieved together with the emancipation of society from Judaism, i.e. commercialism. The second declared that in Germany no partial political emancipation was possible; there was now only one class from which a real and reckless fight against authority was to be expected—namely, the proletariat. But the proletariat could not emancipate itself except by breaking all the chains, by dissolving the constituted society, by recreating man as a member of the human society in the place of established states and classes. "Then the day of German resurrection will be announced by the crowing of the Gallican cock." Both
articles thus relegated the solution of the questions then prominent in Germany to the advent of socialism, and so far resembled in principle other socialist publications of the time. But the way of reasoning was different, and the final words of the last quoted sentence pointed to a political revolution, to begin in France as soon as the industrial evolution had created a sufficiently strong proletariat. In contradiction to most of the socialists of the day, Marx laid stress upon the political struggle as the lever of social emancipation. In some letters which formed part of a correspondence between Marx, Ruge, Ludwig Feuerbach, and Mikhail Bakunin, published as an introduction to the review, this opposition of Marx to socialist "dogmatism" was enunciated in a still more pronounced form: "Nothing prevents us," he said, "from combining our criticism with the criticism of politics, from participating in politics, and consequently in real struggles. We will not, then, oppose the world like doctrinarians with a new principle: here is truth, kneel down here! We expose new principles to the world out of the principles of the world itself. We don't tell it: 'Give up your struggles, they are rubbish, we will show you the true war-cry.' We explain to it only the real object for which it struggles, and consciousness is a thing it must acquire, but to you, it won't be acquired."

In Paris Marx met FRIEDRICH ENGELS (1820-1895), from whom the Deutsch-französische Jahrbücher had two articles—a powerfully written outline of a criticism of political economy, and a letter on Carlyle's Past and Present. Engels, the son of a wealthy cotton-spinner, was born in 1820 at Barmen. Although destined by his father for a commercial career, he attended a classical school, and during his apprenticeship and whilst undergoing in Berlin his one year's military service, he had given up part of his free hours to philosophical studies. In Berlin he had frequented the society of the Freien, and had written letters to the Rheinische Zeitung. In 1842 he had gone to England, his father's firm having a factory near Manchester, and had entered into connexion with the Owenite and Chartist movements, as well as with German communists. He contributed to Owen's New Moral World and to the Chartist Northern Star, gave up much of his abstract speculative reasoning for a more positivist conception of things, and took to economic studies. Now, in September 1844, a month in which in Paris, he visited Marx, and they two founded in regard to all theoretical points there was perfect agreement between them. From that visit dates the close friendship and uninterrupted collaboration and exchange of ideas which lasted during their lives, so that even some of Marx's subsequent works, which he published under his own name, are more or less also the work of Engels. The first result of their collaboration was the book Die heilige Familie oder Kritik der kritischen Kritik, gegen Bruno Bauer und Konsorten, a scathing exposition of the perverseness of the high-sounding speculative radicalism of Bauer and the other Berlin Freie. By aid of an analysis, which, though not free from exaggeration and a certain diffuseness, bears testimony to the great learning of Marx and the vigorous discerning faculty of both the authors, it is shown that the supposed superior criticism—the "critical criticism" of the Bauer school, based upon the doctrine of a "self-conscious" idea, represented by or incarnated in the critic—was in fact inferior to the older Hegelian idealism. The socialist and working-class movements in Great Britain, France and Germany are defended against the superior criticism of the "holy" Bauer family.

In Paris, where he had very intimate intercourse with Heinrich Heine, who always speaks of him with the greatest respect, and some of whose poems were suggested by Marx, the latter contributed to a Radical magazine, the Vorwärts; but in consequence of a request by the Prussian government, nearly the whole staff of the magazine soon got orders to leave France. Marx now went to Brussels, where he shortly afterwards was joined by Engels. In Brussels he published his second great work, La Mise de la philosophie, a sharp rejoinder to the Philosophie de la misère ou contradictions économiques of J. P. Proudhon. In this he deals with Proudhon, whom in the former work he had defended against the Bauers, not less severely than with the latter. It is shown that in many points Proudhon is inferior to both the middle-class economists and the socialists, that his somewhat noisily proclaimed discoveries in regard to political economy were made long before by English socialists, and that his main remedies, the "constitution of the labour-value" and the establishment of exchange bazaars, were but a repetition of what English socialists had already worked out much more thoroughly and more consistently. Altogether the book shows remarkable knowledge of political economy. In justice to Proudhon, it must be added that it is more often his mode of speaking than the thought underlying the attacked sentences that is hit by Marx's criticism. In Brussels Marx and Engels also wrote a number of essays, wherein they criticized the German literary representatives of that kind of socialism and philosophic radicalism which was mainly influenced by the writings of Ludwig Feuerbach, and deduced its theorems or postulates from speculations on the "nature of man." They mockingly nicknamed this kind of socialism "German or True Socialism," and ridiculed the idea that by disregarding historical and class distinctions a conception of society and socialism superior to that of the English and French workers and theorists could be obtained. Some of their essays were published at the time, two or three, curiously enough, by one of the attacked writers in his own magazine; one, a criticism of Feuerbach himself, was in a modified form published by Engels in 1885, but others have remained in manuscript. They were at first intended for publication in two volumes as a criticism of post-Hegelian German philosophy, but the Revolution of 1848 postponed for a time all interest in theoretical discussions.

In Brussels Marx and Engels came into still closer contact with the socialist working-class movement. They founded a German workers' society, acquired a local German weekly, the Brüsseler deutsche Zeitung, and finally joined a communist society of German workers, the "League of the Just," a secret society which had its main branches in London, Paris, Brussels and several Swiss towns. For this league, which till then had adhered to the rough-and-ready communism of the gifted German workman Wilhelm Weitling, but which now called itself "League of the Communists," and gave up its leanings towards conspiracy and revolution, Marx and Engels at the end of 1847 wrote their famous pamphlet, Manifest der Kommunisten. It was a concise exposition of the history of the working-class movement in modern society according to their views, to which was added a critical survey of the existing socialist and communist literature, and an explanation of the attitude of the Communists towards the advanced opposition parties in the different countries. Scarcely was the manifesto printed when, in February 1848, the Revolution broke out in France, and "the crowing of the Gallican cock" gave the signal for an upheaval in Germany such as Marx had prophesied. After a short stay in France, Marx and Engels went to Cologne in May 1848, and there with some friends they founded the Neue rheinische Zeitung, with the sub-title "An Organ of Democracy," a political daily paper on a large scale, of which Marx was the chief editor. They took a frankly revolutionary attitude, and directed their criticism to a great extent against the middle-class democratic parties, who, by evading all decisive issues, delayed the achievement of the upheaval. When in November 1848 the king of Prussia dissolved the National Assembly, Marx and his friends advocated the non-payment of taxes and the organization of armed resistance. Then the state of siege was declared in Cologne, the Neue rheinische Zeitung was suspended, and Marx was put on trial for high treason. He was unanimously acquitted by a middle-class jury, but in May 1849 he was expelled from Prussian territory. He went to Paris, but was soon given the option of either leaving France or settling at a small provincial place. He preferred the former, and went to England. He settled in London, and remained there for the rest of his life.

At first he tried to reorganize the Communist League; but soon a conflict broke out in its ranks, and after some of its members had been tried in Germany and condemned for high
tension, Marx, who had done everything to save the accused, dissolved the Communist League altogether. Nor was a literary enterprise, a review, also called the *Neue rheinische Zeitung*, dissolved by the Russian, denounced *A first der politischen*, published at that time, met with a very vehement criticism in the *Neue rheinische Zeitung*. The endeavours of Ernest Jones and others to revive the Chartist movement were heartily supported by Marx, who contributed to several of the Chartist journals of the period, mostly, if not wholly, without getting or asking payment. He lived at this time in great financial straits, occupied a few small rooms in Dean Street, Soho, and all his children then born died very young. At length he was invited to write letters for the *New York Tribune*, whose staff consisted of advanced democrats and socialists of the Fourierist school. For these letters he was paid at the rate of a guinea each. Part of them, driving in the Eastern Press in the Crimean War, were republished in 1857 (London, Sonnenschein). Some were even at the time reprinted in pamphlet form. The co-operation of Marx, who was determinedly anti-Russian, since Russia was the leading reactionary power in Europe, was obtained by David Urquhart and his followers. A number of Marx’s articles were issued as pamphlets by the Urquhartite committees, and Marx wrote a series of articles on the diplomatic history of the 18th century for the Urquhartite *Free Press* (Sheffield and London, 1856-1857). When in 1859 the Franco-Austrian War about Italy broke out, Marx denounced it as a Franco-Russian intrigue, directed against Germany on the one hand and the revolutionary movement in France on the other. He opposed those democrats who supported a war which in their eyes aimed at the independence of the Italian nation and promised to weaken Austria, whose superiority in Germany was the hindrance to German unity. Violent derogatory remarks directed against him by the well-known naturalist Karl Vogt gave occasion to a not less vehement rejoinder, *Herr Vogt*, a book full of instructive material for the student of modern history. Marx’s contention, that Vogt acted as an agent of the Bonapartist clique, seems to have been well founded, whilst it must be an open question how far Vogt acted from dishonourable motives. The discussions raised by the war also resulted in a great estrangement between Marx and Ferdinand Lassalle. Lassalle had taken a similar view of the war that advocated by Vogt, and fought tooth and nail for it in letters to Marx. In the same year, 1859, Marx published as a first result of his renewed economic studies the book *Zur Kritik der politischen Ökonomie*. It was the first part of a much larger work planned to cover the whole ground of political economy. But Marx found that the arrangement of his materials did not fully answer his purpose, and that many details had still to be worked out. He consequently altered the whole plan and sat down to rewrite the book, of which in 1867 he published the first volume under the title *Das Kapital*.

In the meantime, in 1864, the International Working Men’s Association was founded in London, and Marx became in fact though not in name, the head of its general council. All its addresses and proclamations were penned by him and explained in lectures to the members of the council. The first years of the International went smoothly enough. Marx was then at his best. He displayed in the International a political sagacity and toleration which compare most favourably with the spirit of some of the publications of the Communist League. He was more of its teacher than an agitator, and his expositions of such subjects as education, trade unions, the working day, and co-operation were highly instructive. He did not hurry on extreme resolutions, but put his proposals in such a form that they could be adopted by even the more backward sections, and yet contained no concessions to reactionary tendencies. But this condition of things was not permitted to go on. The anarchist agitation of Bakunin, the Franco-German War, and the Paris Commune created a state of things before which the International succumbed. Passions and prejudices ran so high that it proved impossible to maintain any sort of centralized federation. At the congress of the Hague, September 1872, the general council was removed from London to New York. But this was only a makeshift, and in July 1876 the rest of the old International was formally dissolved at a conference held in Philadelphia. That its spirit had not passed away was shown by subsequent international congresses, and by the growth and character of socialist labour parties in different countries. They have mostly founded their programmes on the basis of its principles, but are not always in their details quite in accordance with Marx’s views. Thus the programme which the German socialist party accepted at its congress in 1875 was very severely criticized by Marx. This criticism, reprinted in 1871 in the review *Die neue Zeit*, is of great importance for the analysis of Marx’s conception of socialism.

The dissolution of the International gave Marx an opportunity of returning to his scientific work. He did not, however, publish further volumes of *Das Kapital*. To make it—and especially the part dealing with property in land—as complete as possible, he took up, as Engels tells us, a number of new studies, but repeated illness interrupted his researches, and on the 14th of March 1883 he passed quietly away.

From the manuscripts he left Engels compiled a second and a third volume of *Das Kapital* by judiciously and elaborately using complete and incomplete chapters, rough copies and excerpts, which Marx had at different times written down. Much of the copy used is the result of a revision of the three essays left by Marx, as well as his most recent work at the time of his death. The last volume conceived by Marx, so that, e.g., the matter published as the third volume was in the main written much earlier than the matter which was used for compiling the second volume. The same applies to the third volume of this work. The four volumes promised in the preface to the book, it can only be in a very restricted sense be regarded as complete. In substance and demonstration it must be regarded as a torso. And it is perhaps not quite accurate to call it a torso, as it has enjoyed better health, would have given the world a much greater amount of scientific work of high value than is now the case. But it seems doubtful whether he would have brought *Das Kapital*, his main work, to a satisfactory conclusion.

*Das Kapital* proposes to show up historically and critically the whole mechanism of capitalist economy. The first volumes deal with the processes of producing capital, the second with the circulation of capital, the third with the process of producing surplus-value, and the fourth gives the history of the theories concerning capital. Capital is, according to Marx, the means of appropriating surplus-value as distinguished from ground rent (rent on every kind of territorial property, such as land, mines, rivers, &c., based upon the monopoly nature of such property) and wages. In the process of production only, it is this part of the value of the newly created product which is not given to the worker as a return—the labour-force he expended in working. If at first taken by the employer, it is in the different phases of economic intercourse split up into the profit of industrial enterprise, commercial or merchants' profit, interest and ground rent. The value of every commodity consists in the labour expended on it, and is measured according to the time and trouble required to produce the means of production. Labour in itself has no value, being only the measure of value, but the labour-force of the worker has a value, the value of the means required to maintain the worker in normal conditions of social existence. To know the value of a commodity is not to know its price, for the value of any commodity is determined by its socially necessary costs of production (or in this case, maintenance). "Socially necessary" means, further, that no more labour is embodied in a commodity than is necessary for its production by average or normal efficiency, and that the commodity is produced in such quantity as is required to meet the effective demand for it. As this generally cannot be known in advance, the market value of a commodity only gravitates round its (abstract) value. But in the long run an equalization takes place, and for his further deductions Marx assumes that commodities exchange according to their value.

That part of an industrial capital which is employed for installations, machines, raw and auxiliary materials, is called by Marx *constant capital*, for the value of it or of its wear and tear reappears in equal proportions in the value of the new product. It is otherwise with labour. The new value of the product must by necessity
be always higher than the value of the employed labour-force. Hence the capital employed in buying labour-force, i.e. in wages, is called **variable capital**. It is the tendency of capitalist production to reduce the amount spent in wages and to increase the amount invested in machines and raw material. Nor is this tendency prevented by the other limitations of the working day, and the opposition to unlimited reduction of wages, it is not possible otherwise to cheapen production and beat competition. According to the proportion of constant to variable capital, the period of the circulation of the most costly agent is always more or less prolonged; the highest composition, the highest composition being that where proportionately the least amount of variable (wages) capital is employed.

The ratio of the wages which workers receive to the surplus-value which they produce Marx calls the **rate of surplus-value;** that of the surplus-value produced to the whole capital employed is the **rate of profit.** It is evident, then, that at the same time the rate of surplus-value can increase and the rate of profit decrease, and that the rate of profit can decrease, and only by some counteracting forces is their decrease temporarily interrupted, protracted, or even sometimes reversed. Besides, by competition and movement of capitals the rates of profit and wages have been forced down to false or apparently equal, an **equalization** in the shape of an **average rate of profits.** This average rate or profits, added to the actual cost price of a given commodity, constitutes its **price of production,** and it is this price of production which influences, and is influenced by, the value of the commodity, which hitherto has given rise to the value of the commodity. The real law of value, on the contrary, does not appear from the surface in a society where, as to-day, commodities are bought and sold against money and not exchanged against other commodities. Nevertheless, according to Marx, it is also true of this law of value ("labour-value") which in the last resort rules the prices and profits.

The tendency to cheapen production by increasing the relative proportion of fixed to variable capital is a property of the capitalist economist plus that portion of the circulating capital which consists of raw and auxiliary materials, &c.—leads to a continuous increase in the size of private enterprises, to their growing concentration and monopolies, and to an increase in the average rate of profits. The number of dependent workers—"proletarians"—is thus continually growing, whilst employment only periodically keeps pace with their number. Capital alternately attracts and repels workers, and creates a constant struggle of wages and working conditions—conditions, which helps to lower wages and to keep the whole class in economic dependency. A decreasing number of capitalists usurp and monopolize all the benefits of industrial progress, whilst the mass of misfortune, of oppression and service, is that of the working class. But at the same time the working class continuously grows in numbers, and is disciplined, united and organized by the very mechanism of the capitalist mode of production. The centralization of the means of production appears to the empirical mind the class war, which will reach a point where they will become incompatible with their capitalist integument. Then the knell of capitalist private property will have rung. Those who used to expropriate will be expropriated. In the end, the unemployed and unemployable gains a future that is independent of usury and common ownership of the earth and the means of production produced by labour.

These are the principal outlines of Das Kapital. Its purely economic features are unfolded through by the theory of surplus-value. Its leading sociological principle is the materialist conception of history. This theory is in Das Kapital only laid down by implication, but it has been more connected explained in the paragraphs that follow. Two important facts to be considered first are: 1. the material basis of life, the manner in which life and its requirements are produced, determines in the last instance the social ideas and institutions of the time or historical epoch, so that fundamental changes appear in the economic mode of production, and not the other way round; 2. the method of production is determined by the social relations in the latter. A set of social institutions answer to a given mode of production, and periods when the institutions no longer answer to the mode of production are periods of social revolution, which go hand in hand with the adjustments of the forces of production and the struggle between the old order and the new. These are the classes into which society is divided after the dissolution of the communistic or semi-communistic tribes and the creation of states. And as long as society is divided the classes a class war is certain, which can end either in more latent or more acute form, according to circumstances. In advanced capitalist society the classes between whom the decisive war place are the capitalist owners of the means of production and the wage-workers. But the proletariat cannot free itself without freeing all other oppressed classes, and thus its victory marks the end of exploitation and political repression altogether. Consequently the state as a representative of exploitation and a form of political repression is no longer needed.

Almost from the first Das Kapital and the publications of Marx and Engels connected with it have been subjected to all kinds of criticisms. The originality of its leading ideas has been disputed, the ideas themselves have been said to be false or occasionally true, and consequently leading to wrong conclusions; and it has been said of many of Marx's statements that they are incorrect, and that many of the statistics upon which he bases his deductions do not prove what he wants them to prove. In regard to the first point, it must be conceded that the *disjecta membra* of Marx's value theory and of his materialist conception of history are already to be found in the scattered writings of his predecessors. But when one can say that just those points of the Marxist doctrine which have become popular are in a very small degree the produce of Marx's genius, and that what really belongs to Marx, the methodical construction of the whole materialist conception of history, is drawn from their application, are generally ignored. But this is an experience repeated over and over again in the history of deductive sciences, and is quite irrelevant for the question of Marx's place in the development of social scientific knowledge.

It must further be admitted that in several places the statistical evidence upon which Marx bases his deductions is insufficient or inconclusive. Moreover—and this is one of the most damaging criticisms—it repeatedly happens that he points out all the phenomena connected with a certain idea is subjected for the sake of the same of some of them and proceeds as if they did not exist. Thus, e.g., he speaks at the end of the first volume, where he sketches the historical tendency of capitalist accumulation, of the decreasing number of capitalists, of generalized crises, and of the surplus-value, without showing that the number of capitalists does not decrease, but increase; and in other places in *Das Kapital* this fact is indeed fully admitted, and even accentuated. Marx was, as the third volume shows, also acquainted with the tendency of the capitalist mode of production to accentuate the distribution of wealth. But he leaves this factor, too, quite out of sight, and confuses the concentration of private enterprises with the centralized fortunes and capitals. By these and other criticisms, which have been directed against Marx in the way described.

In this and in other features of his work *Kritik der Politischen Wissenschat* itself which are capable to be found in the *Kritik der Politischen Wissenschat* of the spirit of the scholar and the spirit of the radical revolutionary. Marx originally entitled his great social work *Kritik der Politischen Wissenschat,* and this is still the sub-title of *Das Kapital.* It has long been known to as "Das Kapital," a name which was not pronounced anything. He uses them mostly as identical with fundamentally opposing. Much as he had mocked the "critical criticism" of the Baurers, he is in this respect yet of their breed and relapses into another kind of dialectical materialist dialectics cannot conclude much beyond actual facts. Dialectical materialism is revolutionary in the sense that it recognizes no finality, but otherwise it is necessarily positivist in the general meaning of that term. But Marx's opposition to modern society was fundamental and revolutionary, answering to that of the proletarian to the bourgeoisie. And here we come to the main and fatal contradiction of his work. He wanted to proceed, and to a very great extent did proceed, scientifically. Nothing was to be deduced from proved ideas; from the observed events. He never conceived the idea that the dialectical movement of facts, and the real movement of facts is only considered so far as is compatible with the former. Science is violated in the service of speculation. The picture given at the end of the first volume from the aspect of a canting optimist, and never to get this administrative aspect. With regard to the theory of surplus-value and its foundation, the theory of labour-value, so much may be
8 II

safely said that, its premises accepted, it is most ingeniously and most consistently worked out. And since its principal content is in any case so far true that the wage-earning workers as a whole produce more than they receive, the theory has the great merit of directing the minds of the wage workers towards the struggle to equalize wages and surplus-produce and the growth and movements of capital. But the theory of labour-value as the determining factor of the exchange or market value of commodities can with justification be disputed, and is surely not more true than those theories which are based on the concept of the social function of the wage-labourer in placing in the third volume what he calls the law of value in the background and setting out the formation of the "price of production" as the empirical determinator of prices in modern society, justifies those who look for the development of labour the broadest, most all-inclusive structure of labour-value which does not apply to individual exchanges of commodities at all, but which only serves to show an imagined typical example of what in reality to-day is only true with regard to the production of surplus-value. But this is not what is exactly meant, the crowning and most popularly accepted of the ideas of Marx which itself is quite unobjectionable, but it loses much of the significance attributed to it by most of the disciples of Marx and occasionally by Marx himself. It is a means of analysing and exemplifying surplus-labour, but quite incohesive as to the proof of the surplus-value, or as an indication of the degree of the exploitation of the workers. This becomes the more apparent the more the reader advances in the second and third volumes of Das Kapital, where commercial capital, money capital and capital and rent are dealt with together. Thus the conception of the labourer as a revolutionary standpoint, an anti-climax to the first volume. It is difficult to see how, after all that is explained there on the functions of the classes that stand between industrial employers and workers, Marx could have returned to those sweeping conclusions with which the first volume ends.

The great scientific achievement of Marx lies, then, not in these conclusions, but in the details and yet more in the method and principles of his theory. In his historical writing he is often a dogmatist, as is now generally admitted, broken new ground and opened new ways and new outlooks. Nobody before him had so clearly shown the role of the productive agencies in historical evolution; nobody so clearly seen in the historical development of his own time something that was to be the basis of the whole of the development of society after him; nobody before him had accounted for the active parts of historical development. Hence the scientific character of his theoretical writings, so far as that meant for Marx not only the fine analysis of the historical process, but also a conception that was adequate to the difficulties of his historical work. In no other work, not in those of his later years, does Marx so clearly bring out the parts of the historical process as in his first volume of Capital. And nowhere else do the ideas of Marx take on the character of the ideas of Marx the only Marx is the ideas of Marx the historical writer that are of Marx's great political significance to the work of the political writer: there is perhaps more to be said for the view that he meant to assign the Magnificat to Elizabeth. Mary was present at the Crucifixion, where she was commanded by Jesus to the care of the apostle John (John xix. 26, 27), Joseph having apparently died before this time. Mary is mentioned in Acts i. 14 as having been among those who continued in prayer along with the apostles at Jerusalem during the interval between the Ascension and Pentecost. There is no allusion in the New Testament to the time or place of her death.

The subsequent growth of ecclesiastical tradition and belief regarding Mary will be traced most conveniently under the separate heads of (1) her perpetual virginity, (2) her absolute sinlessness, (3) her peculiar relation to the Godhead, which specially fits her for successful intercession on behalf of mankind.

**Her Perpetual Virginity.**—This doctrine was, to say the least, of no importance in the eyes of the evangelists, and so far as extant writings go there is no evidence of its having been anywhere taught within the pale of the Catholic Church of the first three centuries. On the contrary, to Tertullian the fact of

1. The name (Heb. שמכה), that of the sister of Moses and Aaron, is of uncertain etymology; many interpretations have been suggested. It is the name of the Virgin Mary, however, that has attained considerable currency through Jerome (the Onomasticon), may be at once dismissed. It seems to have been very common among the Jews in New Testament times: besides the subject of the present notice there are mentioned (1) "Mary, the wife of Clopas," who was perhaps the mother of James the little (Matt. 27:56); (2) "Mary, the mother of James," of Magdala, i.e. of Magdala; (3) Mary of Bethany, sister of Martha and Lazarus; (4) Mary, the mother of Mark; and (5) Mary, an otherwise unknown benefactress of the apostle Paul (Rom. vii. 6).
Mary's marriage after the birth of Christ is a useful argument for the reality of the Incarnation against gnostic notions, and Origen relies upon the references to the Lord's brethren as disproving the Docetism with which he had to contend. The ákouménia though very ancient, is in reality a doctrine of non-Catholic origin, and first occurs in a work proscribed by the earliest papal Index liberorum prohibitorum (attributed to Gelasius) as heretical, the so-called Protevangelium Jacobi, written, it is generally admitted, within the 2nd century. According to this very early source, which seems to have formed the basis of the later Liber de infantia Mariae et Christi salvatoris and Evangelium de nativitate Mariae, the name of Mary's father was Joachim (in the Liber de infantia a shepherd of the tribe of Judah, living in Jerusalem); he had long been married to Anna her mother, whose continual childlessness had become a cause of much humiliation and sorrow to them both. The birth of a daughter was at last angelically predicted to each parent separately. From her third to her twelfth year Mary was in the Temple as if she were a dove that dwelt there, and she received food from the hand of an angel.1 When she became of nubile age a guardian was sought for her by the priests among the widowers of Israel lest she should defile the sanctuary of the Lord; and Joseph, an elderly man with a family, was indicated for this charge by a miraculous token. Some time afterwards the announcement took place; when the Virgin's pregnancy was discovered, Joseph and she were brought before the high priest, and, though asserting their innocence in all sincerity, were acquitted only after they had been tried with "the water of the ordeal of the Lord" (Num. v. 11). Numerous details regarding the birth at Bethlehem are then given. The perpetual physical virginity of Mary, naively insisted upon in this apocryphon, is alluded to only with a half belief and a "some say" by Clement of Alexandria (Strom. vii. 16), but became of much importance to the leaders of the Church in the 4th century, as for example to Ambrose, who sees in Ezek. xliv. 1-3 a prophetic indication of such a mystery.2 Those who continued to believe that Mary, after the miraculous birth of Jesus, had become the mother of other children by Joseph came accordingly to be spoken of as her enemies—Antidicomarianite (Epiphanius) or Antidicomarianite (Augustine)—and the first-mentioned author devotes a whole chapter (ch. 78) of his great work upon heresies to their condemnation. For holding the same view Bonosus of Sardica was condemned by the synod of Capua in 391. To Jerome the perpetual virginity not only of Mary but even of Joseph appeared of so much consequence that while a young man he wrote 387) the long and vehement tract Against Helvidius, in which he was the first to broach the theory (which has since gained wide currency) that the brethren of our Lord were children neither of Mary by her husband nor of Joseph by a former marriage, but of another Mary, sister to the Virgin and wife of Clopas or Alphaeus. At last the epithet of dei párthenos was authoritatively applied to the Virgin by the council of Chalcedon in 451, and the doctrine was finally and undoubtedly accepted by orthodoxy both in the Eastern and in the Roman Churches, some even seeking to hold the Anglican Church committed to it on account of the general declaration (in the Homilies) of concurrence in the decisions of the first four general councils.

Her Absolute Sinlessness.—While much of the apocryphal literature of the early sects in which she is repeatedly spoken of as "undefiled before God" would seem to encourage some such doctrine as this, many passages from the acknowledged fathers of the Church could be cited to show that it was originally quite unknown to Catholicism. Even Augustine repeatedly asserts that she was born in original sin (De gen. ad lit. x. 18); and the locus classicus regarding her possible immunity from actual transgression, on which the subsequent doctrine of Lombardus and his commentators was based, is simply an extremely guarded passage (De nat. et grat. ch. 30), in which, while contradicting the assertion of Pelagius that many had lived free from sin, he wishes exception to be made in favour of "the holy Virgin Mary, of whom out of honour to the Lord I wish no question to be made where sins are treated of—for how do we know what mode of grace wholly to conquer sin may have been bestowed upon her who was found meet to conceive and bear Him of whom it is certain that He had no sin." A writer so late as Anselm (Cur deus homo, ii. 10) declares that "the Virgin herself whence He (Christ) was assumed was conceived in iniquity, and in sin did her mother conceive her, and with original sin was she born, because she too sinned in Adam in whom all sinned," and the same view was expressed by Damian. For the growth of the modern Roman doctrine of the immaculate conception from the time of the 12th century, when the canons of Lyons sought to institute a festival in honour of her "holy conception," and were remonstrated with by Bernard, see IMMACULATE CONCEPTION. The epithets applied to her in the Greek Church are such as ἁμαρτίας, παράγος, ἀγία, παραγεία; but in the East generally no clear distinction is drawn between immunity from actual sin and original sinlessness.

Her Peculiar Relation to the Godhead, which specially fits Her for Successful Intercession on Behalf of Mankind.—It seems probable that the epithet theόγος ("Mother of God") was first applied to Mary by theologians of Alexandria towards the close of the 3rd century; but it does not occur in any genuine extant writing of that period, unless we are to assign an early date to the apocryphal Transitus Mariae, in which the word is of frequent occurrence. In the 4th century it is met with frequently, being used by Eusebius, Athanasius, Didymus and Gregory of Nazianzus,—the latter declaring that the man who believes not Mary to have been theόγος has no part in God (Orat. li. p. 738).3 If its use was first recommended by a desire to bring into prominence the divinity of the Incarnate Word, there can be no doubt that latterly the expression came to be valued as directly honourable to Mary herself and as corresponding to the greatly increased esteem in which she personally was held throughout the Catholic world, so that when Nestorius and others began to dispute its propriety, in the following century, their temerity was resented, not as an attack upon the established orthodox doctrine of the Nicene creed, but as threatening a more vulnerable and more tender part of the popular faith. It is sufficient in illustration of the drift of theological opinion to refer to the first sermon of Proclus, preached on a certain festival of the Virgin (παρθένου παρθένην) at Constantinople about the year 430 or to that of Cyril of Alexandria delivered in the church of the Virgin Mary at the opening of the council of Ephesus in 431. In the former the orator speaks of "the holy Virgin and Mother of God" as "the spotless treasure-house of virginity, the spiritual paradise of the second Adam; the workshop in which two natures were welded together. . . . the one bridge between God and men," and in the latter she is saluted as the "mother and advocate of men," through whom (καί) the Trinity is glorified and worshipped, the care of the Savior realized and honoured, through whom heaven triumphs, the angels are made glad, devils driven forth, the tempter overcome, and the fallen creature raised up even to heaven." The response which such language found in the popular heart was sufficiently shown by the shouts of joy with which the Ephesian mob heard of the deposition of Nestorius, escorting his judges with torches and incense to their homes, and celebrating the occasion by a general illumination. The causes which in the preceding century had led to this exaltation of the Mother of God in the esteem of the Catholic world are not far to seek. On the one hand the solution of the Arian controversy, however correct it may have been theoretically, undoubtedly had the practical effect

1 See Gieseler (KG., Bd. i. Abth. 1), who points out instances in which anti-Arianizing zeal went so far as to call David theόγος and James δει αὐτούς.
2 Labbé, Conc. iii. 51. Considerable extracts are given by Augusti (Denkw. iii.); see also Millman (Lat. Christ. i. 185), who characterizes much of it as a "wild labyrinth of untranslatable metaphor."

De Inst. Virg., "qua est haec porta nisi Maria? . . . per quam Christus intravit in hunc mundum, quando virginali fusu est partu et genitalia virginitatis clausa non solvit."
of relegating the God-man redeemer for ordinary minds into a far away region of "remote and awful Godhead," so that the need for a mediator to deal with the very Mediator could not fail to be felt. On the other hand, the religious instincts of mankind are very ready to pay worship, in grosser or more refined forms, to the idea of womanhood; at all events many of those who became professing Christians at the political fall of Paganism entered the Church with such instincts (derived from the nature-religions in which they had been brought up) very fully developed. Probably it ought to be added that the comparative colourlessness with which the character of Mary is presented, not only in the canonical gospels but even in the most copious of the apocrypha, left greater scope for the untrammelled exercise of devout imagination than was possible in the case of Christ, in the circumstances of whose humiliation and in whose recorded utterances there were many things which the religious consciousness found difficulty in understanding or in adapting to itself. At all events, from the time of the council of Ephesus, to exhibit figures of the Virgin and Child became the approved expression of orthodoxy, and the relation of the Church to that mythology which has been formally declared to stand to God\(^1\) was instinctively felt to give the fullest and freest sanction of the Church to that invocation of her aid which had previously been resorted to only hesitatingly and occasionally. Previously to the council of Ephesus, indeed, the practice had obtained complete recognition, so far as we know, in those circles only in which one or other of the numerous redactions of the Transitus Mariae passed current.\(^2\) There we read of Mary's prayer to Christ: "Do Thou bestow Thine aid upon every man calling upon, or praying to, or naming the name of Thine handmaid"\(^3\); to which His answer is, "Every soul that calls upon Thy name shall not be ashamed, but shall find mercy and support and confidence both in the world that now is and in that which is to come in the presence of My Father in the heavens." But Gregory of Nazianzus also, in his panegyric upon Justinia, mentions with incidental approval that in her hour of peril she "implied Mary the Virgin to come to the aid of a virgin in her danger."\(^4\) Of the growth of the Marian cultus, alike in the East and in the West, after the decision at Ephesus it would be impossible to trace the history, however slightly, within the limits of the present article. Justinian in one of his laws bespeaks her advocacy for the emperor, and he inscribes the high altar in the new church of St Sophia with her name. Nurses looks to her for directions on the field of battle. The emperor Heraclius bears her image on his banner. John of Damascus speaks of her as the sovereign lady to whom the whole creation has been made subject by her son. Peter Damian recognizes her as the most exalted of all creatures, and apostrophizes her as defied and endowed with all power in heaven and in earth, yet not forgetful of our race.\(^5\) In a word, popular devotion gradually developed the entire system of doctrine and practice which Protestant contro- versialists are accustomed to call by the name of Mariology. With reference to this much-disputed phrase it is always to be kept in mind that the directly authoritative documents, alike of the Greek and of the Roman Church, distinguish formally between latria and dulia, and declare that the "worship" to be paid to the mother of God must never exceed that superlative degree of dulia which is vaguely described as hyperdulia. But the comparative reserve shown by the council of Trent in its decrees, and even in its catechism,\(^6\) on this subject has not been observed by individual theologians, and in view of the fact of the canonization of some of these (such as Liguori)—a fact guaranteeing the absence of erroneous teaching from their writings—it does not seem unfair, to hold the Roman Church responsible for the natural interpretations and just inferences which may be drawn even from apparently exaggerated expressions in such works as the well-known Glories of Mary and others frequently quoted in controversial literature. There is a good résumé of Catholic developments of the cultus of Mary in Pusey's Etieronon.

The following are the principal feasts of the Virgin in the order in which they occur in the ecclesiastical year (1891-2).\(^7\) That of the Presentation (Præsentatio B. V. M., Ράεθοσ τῆς θεοθοσού) was

1. The points taught in the catechism are—that she is truly the Mother of God, and that she has received blessing and life; that she is the Mother of Pity, and very specially our advocate; that her merits are highly exalted, and that her dispositions towards us are extremely gracious; that her images are of the utmost utility. In the Missal her intercessions (though usually only of a general character) are assigned to certain days; in particular she is named as except in the Litany and in some of the later offices, such as those for the 8th of September and for the Festival of the Seven Sorrows (decreed by Benedict XIII. in 1727). Noteworthy are the verses in the office for the 8th of December (The Feast of the Immaculate Conception). "Tota pulchra est, Maria, et macula originalis non est in te," and "Gloriosa dicta sunt de te, Maria; quia fecit tibi magna qui potes est."
MARY MAGDALENE—MARY I.

The Western Church seems to be that found in the proceedings of the synod of Salzburg in 800; it is also spoken of in the thirty-sixth canon of the reforming synod of Mainz, held in 813. It was not, at that time universal, being mentioned as doubtful in the capitularies of Charlemagne. The doctrine of the bodily assumption of the Virgin into heaven, although extensively believed, and indeed flowing as a natural theological consequence from the sinlessness of her sinlessness, has never been declared to be "de fide" by the Church of Rome, and is still regarded as a "dubia" (Mariae genelatio v. theotokou) observed on the 8th of September, is mentioned in one of the homilies of Andrew of Crete (c. 750); and with the Feasts of the Purification, the Annunciation and the Assumption, it was appointed to be observed at the synod of Salzburg in 800, but appears never to have been at that time in the Gallican Church, and even two centuries later it was by no means general in Italy. In the Roman Catholic Church a large number of minor festivals in honour of Mary are still observed in the space of the year as well as the entire month of May are also regarded as sacred to her.

The chief apocryphal writings concerning Mary are the following: (1) The Portæmagnum Jacobi, with its derivatives the De nativitate Mariae, the Evangelium Ps-Matthaei, the Historia Josephi fabri lignarii (all edited by Tischendorf, Evangelia apocrypha, etc.); Harnack, Geschichte der altchristlichen Literatur, p. 20 seq. and Chronologie, t. 1508 seq.); (2) Evangelium Mariae (see Satzungsberichte der Berlinischen Akademie der Wissenschaften 1859, pp. 839–867).

MARY, known as Mary Magdalene, a woman mentioned in the Gospels, first in Luke vii. 3, as one of a company who "healed of evil spirits and infirmities ... ministered unto them (Jesus and the apostles) of their substance." It is said that seven demons were cast out of her, but this need not imply simply one occasion. Her name implies that she came from Magdala (a-Mejdil, 3 m. N.W. from Tiberias: in Matt. xv. 39 the right reading is not Magdala but Magadan). She went with Jesus on the last journey to Jerusalem, witnessed the Crucifixion, followed to the burial, and returned to prepare spices. John xx. gives an account of her finding the tomb empty and of her interview with the risen Jesus. Mary of Magdala has been confounded (1) with the unnamed fallen woman who in Simon's house anointed Christ's feet (Luke vii. 37); (2) with Mary of Bethany, sister of Lazarus and Martha.

MARY I., queen of England (1516–1558), unpleasantly remembered as "the Bloody Mary" on account of the religious persecutions which prevailed during her reign, was the daughter of Henry VIII. and Catherine of Aragon, born in the earlier years of their married life, when as yet no cloud had darkened the prospect of Henry's reign. Her birth occurred at Greenwich, on Monday, the 18th February 1516, and she was baptised by the Emperor Maximilian in the church of Tiberias in Asia Minor. Cardinal Wolsey, standing as her godfather. She seems to have been a singularly precocious child, and is reported in July 1520, when scarcely four and a half years old, as entertaining some visitors by a performance on the virginals. When she was little over nine she was addressed in a complimentary Latin oration by commissioners sent over from Flanders on commercial matters, and replied to them in the same language "with as much assurance and facility as if she had been twelve years old" (Gayangos, iii. pt. 1, 82). Her father was proud of her achievements. About the same time that she replied to the commissioners in Latin he was arranging that she should learn Spanish, Italian and French. A great part, however, of the credit of her early education was undoubtedly due to her mother, who not only consulted the Spanish scholar who resided upon the subject, but was herself the first in her own language to be instructed in music, and among her principal recreations as she grew up was that of playing on the virginals and lute.

It was a misfortune that she shared with high-born ladies generally in those days that her prospects in life were made a matter of sordid bargaining from the first. Mary was little more than two years old when she was proposed in marriage to the dauphin, son of Francis I. Three years afterwards the French alliance was broken off, and in 1522 she was affianced to her cousin the young emperor Charles V. by the Treaty of Windsor. No one, perhaps, seriously expected either of these arrangements to endure; and, though we read in grave state papers of some curious compliments and love tokens (really the mere counters of diplomacy) professedly sent by the girl of nine to her powerful cousin, not many years passed away before Charles released himself from this engagement and made a more convenient match. In 1526 a rearrangement was made of the royal household, and it was thought right to give Mary an establishment of her own along with a council on the borders of Wales, for the better government of the marches. For some years she accordingly kept her court at Ludlow, while new arrangements were made for the disposal of her hand. She was now proposed as a wife, not for the dauphin as before, but for his father Francis I., who had just been redeemed from captivity at Madrid, and who was only too glad of an alliance with England to mitigate the severe conditions imposed on him by the emperor. Wolsey, however, on this occasion only made use of the princess as a bait to enhance the terms of the compact, and left Francis free in the end to marry the emperor's sister.

It was during this negotiation, as Henry afterwards pretended, that the question was first raised whether Henry's own marriage with Catherine was a lawful one. Grammont, bishop of Tarbes, who was one of the ambassadors sent over by Francis to ask the princess in marriage, had, it was said, started an objection that she might possibly be considered illegitimate in account of her mother having been once the wife of her father's brother. The statement was a mere pretence to shield the king when the unpopularity of the divorce became apparent. It is proved to be untrue by the strongest evidence, for we have pretty full contemporary records of the whole negotiation. On the contrary, it is quite clear that Henry, who had already for some time conceived the project of a divorce, kept the matter a dead secret, and was particularly anxious that the French ambassadors should not know it, while he used his daughter's hand as a bait for a new alliance. The alliance itself, however, was actually concluded by a treaty dated Westminster, the 30th of April 1527, in which it was provided, as regards the Princess Mary, that she should be married either to Francis himself or to his second son Henry duke of Orleans. But the real object was only to lay the foundation of a perfect mutual understanding between the two kings, which Wolsey soon after went into France to confirm.

During the next nine years the life of Mary, as well as that of her mother, was rendered miserable by the conduct of Henry VIII. in seeking a divorce. During most of that period her mother was in Madrid, and it is possible that Catherine had the harder trial; but Mary's was scarcely less severe. Removed from court and treated as a bastard, she was, on the birth of Anne Boleyn's daughter, required to give up the dignity of princess and acknowledge the illegitimacy of her own birth. On her refusal her household was broken up, and she was sent to Hatfield to act as lady-in-waiting to her own infant half-sister. Nor was even this the worst of her trials; her very life was in danger from the hatred of Anne Boleyn. Her health, moreover, was indifferent, and even when she was seriously ill, although Henry sent his own physician, Dr Buttes, to attend her, he declined to let her mother visit her. So also at her mother's death, in January 1536, she was forbidden to take a last farewell of her. But in May following another change occurred. Anne Boleyn, the real cause of all their miseries, fell under the king's displeasure and was put to death. Mary was then urged to make a humble submission to her father as the means of recovering his favour, and after a good deal of correspondence with the king's secretary, Cromwell, she actually did so. The terms exacted of her were bitter in the extreme, but there was no chance of making life tolerable otherwise, if indeed she was permitted to live at all; and the poor friendless girl, absolutely at the mercy of a father who could brook no contradiction, at length subscribed an act of submission, acknowledging the king as "Supreme Head of the Church of England under Christ," repudiating the pope's
authority, and confessing that the marriage between her father and mother "was by God's law and man's law incestuous and unlawful."

No act, perhaps, in the whole of Henry's reign gives us a more painful idea of his revolting despotism. Mary was a high-spirited girl, and undoubtedly popular. All Europe looked upon her at that time as the only legitimate child of her father, but her father himself compelled her to disown the title and pass an unjust stigma on her own birth and her mother's good name. Nevertheless Henry was now reconciled to her, and gave her a household in some degree suitable to her rank. During the rest of the reign we hear little about her except in connexion with a number of new marriage projects taken up and abandoned successively, one of which, to the count palatine Philip, duke of Bavaria, was specially repugnant to her in the matter of religion. Her privy purse expenses for nearly the whole of this period have been published, and show that Hatfield, Beaulieu or Newhall in Essex, Richmond and Hunsdon were among her principal places of residence. Although she was still treated as of illegitimate birth, it was believed that the king, having obtained from parliament the extraordinary powers of dispensing with the crown by will, would restore her to her place in the succession, and three years before his death she was so restored by statute, but still under conditions to be regulated by her father's will.

Under the reign of her brother, Edward VI. she was again subjected to severe trials, which at one time made her seriously meditate taking flight and escaping abroad. Edward himself indeed seems to have been personally not unkind to her, but the religious revolution in his reign assumed proportions such as it had not done before, and Mary, who had done sufficient violence to her own convictions in submitting to a despotic father, was not disposed to yield an equally tame obedience to authority exercised by a factious council in the name of a younger brother not yet come to years of discretion. Besides, the cause of the pope was naturally her own. In spite of the forced declaration formerly wrung from herself, no one really regarded her as a bastard, and the full recognition of her rights depended on the recognition of the pope as head of the Church. Hence, when Edward's parliament passed an Act of Uniformity enjoying his promise of an English and community of England, the law appeared to her totally void of authority, and she insisted on having Mass in her own private chapel under the old form. When ordered to desist, she appealed for protection to the emperor Charles V., who, being her cousin, intervened for some time not ineffectually, threatening war with England if her religious liberty was interfered with. But Edward's court was composed of factions of which the most violent eventually carried the day. Lord Seymour, the admiral, was attainted of treason and beheaded in 1549. His brother, the Protector Somerset, met with the same fate in 1552. Dudley, duke of Northumberland, then became paramount in the privy council, and easily obtained the sanction of the young king to those schemes for altering the succession which led immediately after his death to the usurpation of Lady Jane Grey. Dudley had, in fact, overawed all the rest of the privy council, and when the event occurred he took such energetic measures to give effect to the scheme that Lady Jane was actually recognized as queen for some days, and Mary had even to fly from Hunsdon into Norfolk. But the country was really devoted to her cause, as indeed her right in law was unquestionable, and before many days she was royally received in London, and took up her abode within the Tower.

Her first acts at the beginning of her reign displayed a character very different from that which she still holds in popular estimation. Her clemency towards those who had taken up arms against her was altogether remarkable. She released from prison Lady Jane's husband, Suffolk, and had difficulty even in signing the warrant for the execution of Northumberland. Lady Jane herself she fully meant to spare, and did spare till after Wyatt's formidable insurrection. Her conduct, indeed, was in every respect conciliatory and pacific, and so far as they depended on her personal character the prospects of the new reign might have appeared altogether favourable. But unfortunately her position was one of peculiar difficulty, and the policy on which she determined was far from judicious. Inexperienced in the art of governing, she had no trusty councillor but Gardiner; every other member of the council had been more or less implicated in the conspiracy against her. And though she valued Gardiner's advice she was naturally led to rely even more on that of her cousin, the emperor, who had been her mother's friend in adversity, and had done such material service to herself in the preceding reign. Following the emperor's guidance she determined almost from the first to make his son Philip her husband, though she was eleven years his senior. She was also strongly desirous of restoring the old religion and wiping out the stigma of illegitimacy upon her birth, so that she might not seem to reign by virtue of a mere parliamen
tary settlement.

Each of these different objects was attended by difficulties or objections peculiar to itself; but the marriage was the most unpopular of all. A restoration of the old religion threatened to deprive the new owners of abbey lands of their easy and comfortable income. It was only with an express reservation of their interests that the thing was accomplished. A declaration of her own legitimacy necessarily cast a slur on that of her sister Elizabeth, and cut her off from the succession. But the marriage promised to throw England into the arms of Spain and place the resources of the kingdom at the command of the emperor's son. The Commons sent her a deputation to entreat that she would not marry a foreigner, and when her resolution was known insurrections broke out in different parts of the country. Suffolk, whose first rebellion had been pardoned, proclaimed Lady Jane Grey again in Leicestershire, while young Wyatt raised the county of Kent and, though denied access by London Bridge, led his men round by Kingston to the very gates of London before he was repulsed. In the midst of the danger Mary showed great intrepidity, and the rebellion was presently quelled; after which, unhappily, she got leave to pursue her own course unchecked. She married Philip, restored the old religion, and got Cardinal Pole to come over and absolve the kingdom from its past disobedience to the pope's See and Sentence.

It was a more than questionable policy thus to ally England with Spain—a power then actually at war with France. By the treaty, indeed, England was to remain neutral; but the force of events, in the end, compelled her, as might have been expected, to take part in the quarrel. Meanwhile the country was full of faction, and seditious pamphlets of Protestant origin inflamed the people with hatred against the Spaniards. Philip's Spanish followers met with positive ill-usage everywhere, and violent outbreaks occurred. A year after his marriage Philip went over to Brussels to receive from his father the government of the Low Countries and afterwards the kingdom of Spain. Much to Mary's distress, his absence was prolonged for a year and a half, and when he returned in March 1557 it was only to commit England completely to the war; after which he went back to Brussels in July, to return no more to England.

Hostilities with France were inevitable, because France had encouraged disaffection among Mary's subjects, especially during the brief truce of Vaucelles. Conspiracies had been hatched by English refugees in Paris, and an attempt to seize Scarborough had been made with the aid of vessels from the Seine. But perhaps the strangest thing about the situation was that the pope took part with France against Spain; and so the very marriage which Mary had contracted to bring England back to the Holy See made her the wife of the pope's enemy. It was, moreover, this war with France that occasioned the final calamity of the loss of Calais, which sank so deeply into Mary's heart some time before she died.

The cruel persecution of the Protestants, which has cast so much infamy upon her reign, was not due, as commonly supposed, to inhumanity on her part. When the kingdom was reconciled to Rome and absolved by Cardinal Pole, it
followed, almost as a matter of necessity, that the old heresy laws should be revived, as they were then by Act of Parliament. They had been abolished by the Protector Somerset for the express purpose of promoting changes of doctrine which did violence to what was still the prevailing religious sentiment; and now the old religion required to be protected from insult and fanatical outrages. Doubts were felt as to the result even from the first; but the law having been once passed could not be relaxed merely because the victims were so numerous; for that would only have encouraged the irreverence which it was intended to check. No doubt there were milder men among the heretics, but as a class their stern fanaticism and ill-will to the old religion made them dangerous, even to the public peace. Rogers, the first of the martyrs, was burnt on the 4th of February 1555. Hooper, bishop of Gloucester, had been condemned six days before, and suffered the same fate upon the 9th. From this time the persecution went on uninterruptedly for three years and three quarters, numbering among its victims Ridley, Latimer and Cranmer. It came to an end at last on the death of Mary. It seems to have been more severe in the eastern and southern parts of England, and the largest number of sufferers was naturally in the diocese of Bonner, bishop of London. From first to last nearly three hundred victims are known to have perished at the stake; and their fate certainly created a revulsion against Rome that nothing else was likely to have effected.

Mary was of weak constitution and subject to frequent illnesses, both before and after her accession. One special infirmity caused her to believe a few months after her marriage that she was with child, and thanksgiving services were ordered throughout the diocese of London in November 1554. The same delusion recurred in March 1558, when though she did not make her expectation public, she drew up a will in anticipation of the dangers of childbirth, constituting her husband regent during the minority of her prospective heir. To this she added a codicil on the 28th of October following, when the illness that was to be her last had set in, showing that she had ceased to have much expectation of maternity, and earnestly entreaty her “next heir and successor by the laws” (whom she did not name) to allow execution of the instrument. She died on the 17th of November.

Her name deserved better treatment than it has generally met with; for she was far from cruel. Her kindness to poor people is undoubted, and the severe execution of her laws seemed only a necessity. Even in this matter, moreover, she was alive to the injustice with which the law was usually strained in behalf of the prerogative; and in appointing Sir Richard Morgan chief justice of the Common Pleas she charged him “not to sit in judgment otherwise for her highness than for her subjects,” and to avoid the old error of refusing to admit witnesses against the Crown (Holinhed III. 1112). Her conduct as queen was certainly governed by the best possible intentions; and it is evident that her very zeal for goodness caused most of the trouble she brought upon herself. Her subjects were entirely released, even by papal authority, from any obligation to restore the confiscated lands of the Church. But she herself made it an object, at her own expense, to restore several of the monasteries; and courtiers who did not like to follow her example, encouraged the fanatics to spread an alarm that it would even yet be made compulsory. So the worldly minded joined hands with the godly heretics in stirring up enmity against her.

MARY II. (1662–1694), queen of England and wife of King William III., elder daughter of James, duke of York, afterwards King James II., by his first wife, Anne, daughter of Edward Hyde, 1st earl of Clarendon, was born in London on the 30th of April 1662. She was educated as a Protestant, and as it was probable that she would succeed to the English throne after the death of her uncle, Charles II., and her father, the choice of a husband for her was a political event of high importance. About 1672 the name of William, prince of Orange, was mentioned in this connexion; and after some hesitation on both sides caused by the condition of European politics, the betrothal of William and Mary took place in October 1677, and was quickly followed by their marriage in London on the 4th of November. Mary's married life in Holland does not appear to have been a happy one. Although she soon became popular among the Dutch, she remained childless, while William treated her with neglect and even with insult; and her troubles were not diminished after her father became king of England in 1685. James had treated his daughter very shabbily in money matters; and it was increasingly difficult for her to remain loyal to both father and husband when they were so divergent in character and policy. Although Mary never entirely lost her affection for her father the wife prevailed over the daughter; and after the birth of her half-brother, the prince of Wales, in 1688, she regarded the dethronement of James as inevitable. It cannot be said, however, that William merited this confidence. Possibly he was jealous of his wife as the heiress of the English throne, contrasting her future position with his own; but according to Burnet, who was then staying at the Hague, this cause of difference was removed by the tactful interference of Burnet himself. The latter asserts that having divined the reason of the prince's jealousy he mentioned the matter to the princess, who in her ignorance of statecraft had never considered the relative positions of herself and her husband with regard to the English throne; and that Mary, by telling the prince "she would be no more but his wife, and that she would do all that lay in her power to make him king for life" (Burnet, Supplement, ed. Foxcroft, p. 309), probably mollified her husband's jealousy. On the other hand Macaulay's statement that henceforward there was "entire friendship and confidence" between them must be taken with some reserve. Mary shared heartily in the events which immediately preceded William's expedition to England in 1688. After the success of the undertaking she arrived in London in February 1689; and by her faithful adherence to her promise made a satisfactory settlement of the English crown possible. William and Mary were together proclaimed king and queen of England, and afterwards of Scotland, and were crowned on the 11th of April 1689. During the king's absence from England the queen, assisted by a committee of the privy council, was entrusted with the duties of government, duties which she performed faithfully, but which she gladly laid down on William's return. In these times of danger, however, she acted when necessary with courage and promptitude, as when in 1690 she directed the arrest of her uncle Henry Hyde, 2nd earl of Clarendon; but she was constantly anxious for William's safety, and unable to trust many of her advisers. She was further distressed by a quarrel with her sister Anne in 1692 following the dismissal of Methilbrough, this event somewhat diminished her popularity, which had hitherto been one of the mainstays of the throne. Weak in body and troubled in mind, the queen died at Kensington Palace from small-pox on the 28th of December 1694, and was buried in Westminster Abbey. Mary was a woman of a remarkably modest and retiring disposition, whose outstanding virtue was perhaps her unswerving loyalty to William. Burnet has passed a remarkable panegyric upon her character. She was extremely pious and charitable; her blameless private life was in marked contrast with her surroundings, both in England and Holland; without bigotry she was greatly attached to the Protestant faith and to the Church of England; and she was always eager to improve the tone of public morals, and to secure a better observance of Sunday. Greenwich Hospital for Seamen was founded in her honour.

For the political events of Mary's life see William III. For her private life see Sir John Dalrymple, Memoirs of Great Britain and Ireland (London, 1790); Countess Bentinck, Lettres et mémoires de Marie, reine d'Angleterre (The Hague, 1800); Memoires et Lettres of Mary Queen of England (ed. by R. Doehnber, Leipzig, 1805); F. J. Krämer, Maria II. Stuart (Utrecht, 1890); A. M. Sladen, Lines of the Queens of England, vols. x. and xi. (London, 1847); G. Burnet, History of my own Time (Oxford, 1833); and O. Kloppe, Der Fall des Houses Stuart (Vienna, 1875–1888).
MARY QUEEN OF SCOTS (1542–1587), daughter of King James V, and his wife Mary of Lorraine, was born in December 1542, a few days before the death of her father, heart-broken by the disgrace of his arms at Solway Moss, where the disaffected nobles had declined to encounter an enemy of inferior force in the cause of a king whose systematic policy had been directed against the privileges of their order, and whose representative on the occasion was an unpopular favourite appointed in defiance of their ill-will. On the 9th of September following the ceremony of coronation was duly performed upon the infant. A scheme for her betrothal to Edward, prince of Wales, was defeated by the grasping greed of his father, whose obvious ambition to annex the crown of Scotland at once to that of England aroused instantly the general suspicion and indignation of Scottish patriotism. In 1548 the queen of six years old was betrothed to the dauphin Francis, and set sail for France, where she arrived on the 13th of August. The society in which the child was thenceforward reared is known to readers of Brantôme as well as that of imperial Rome at its worst is known to readers of Suetonius or Petronius as well as that of papal Rome at its worst is known to readers of the diary kept by the domestic chaplain of Pope Alexander VI. Only in their pages can a parallel be found to the gay and easy record which reveals without sign of shame or suspicion of offence the daily life of a court compared to which the court of King Charles II. is as the court of Queen Victoria to the society described by Grammont. Debauchery of all kinds, and murder in all forms, were the daily matter of excitement or jest to the brilliant circle which revolved around Queen Catherine de’ Medici.

After ten years’ training under the tutelage of the woman whose main instrument of policy was the corruption of her own children, the queen of Scots, aged fifteen years and five months, was married to the eldest and feeblest of the brood on the 24th of April 1558. On the 17th of November, Elizabeth became queen of England, and the princes of Lorraine—Francis, the great duke of Guise, and his brother the cardinal—induced their niece and her husband to assume, in addition to the arms of France and Scotland, the arms of a country over which they asserted the right of Mary Stuart to reign as legitimate heiress of Mary Tudor. Civil strife broke out in Scotland between John Knox and the queen-dowager—between the self-styled “congregation of the Lord” and the adherents of the regent, whose French troops repelled the combined forces of the Scotch and their English allies from the beleaguered walls of Leith, little more than a month before the death of their mistress in the castle of Edinburgh, on the 10th of June 1560. On the 25th of August Protestantism was proclaimed and Catholicism suppressed in Scotland by a convention of states assembled without the assent of the absent queen. On the 5th of December Francis II. died; in August 1561 his widow left France for Scotland, having been refused a safe-conduct by Elizabeth on the ground of her own previous refusal to ratify the treaty made with England by her commissioners in the same month of the preceding year. She arrived nevertheless in safety at Leith, escorting her son to his island residence at Edinburgh, where she essayed, in training her future biographer, Brantôme, and Chastelard, the first of all her voluntary victims. On the 21st of August she first met the only man able to withstand her; and her first passage of arms left, as he has recorded, upon the mind of John Knox an ineffaceable impression of her “proud mind, crafty wit and indurate heart against God and His truth.”

And yet her acts of concession and conciliation were such as no fanatic on the opposite side could have approved. She assented, not only the undisturbed maintenance of the new creed, but even to a scheme for the endowment of the Protestant ministry out of the confiscated lands of the Church. Her half-brother, Lord James Stuart, shared the duties of her chief counsellor with William Maitland of Lethington, the keenest and most liberal thinker in the country. By the influence of Lord James, in spite of the earnest opposition of Knox, permission was obtained for her to hear Mass celebrated in her private chapel—a licence to which, said the Reformer, he would have preferred the invasion of ten thousand Frenchmen. Through all the first troubles of her reign the young queen steered her skilful and dauntless way with the tact of a woman and the courage of a man. An insurrection in the north, headed by the earl of Huntly under pretence of rescuing from justice the life which his son had forfeited by his share in a homicidal brawl, was crushed at a blow by the Lord James against whose life, as well as against his sister’s liberty, the conspiracy of the Gordons had been aimed, and on whom, after the father had fallen in battle and the son had expiated his double offence on the scaffold, the leading rebel’s earldom of Murray was conferred by the gratitude of the queen. Exactly four months after the battle of Corriche, and the subsequent execution of a criminal whom she is said to have had “loved entirely,” had put an end to the first insurrection raised against her, Pierre de Boscobel de Chastelard, who had returned to France with the other companions of her arrival, and in November 1562 had revisited Scotland, expiated with his head the offence or the misfortune of a second detection at night in her bed-chamber. In the same month, twenty-five years afterwards, the execution of his mistress, according to the verdict of her contemporaries in France, avenged the blood of a lover who had died without uttering a word to realize the apprehension which (according to Knox) had before his trial impelled her to desire her brother “that, as he loved her, he would slay Chastelard, and let him never speak word.” And in the same month, two years from the date of Chastelard’s execution, the first of all her voluntary victims was taken on the road to Fotheringhay, when she gave her heart at first sight to her kinsman Henry, Lord Darnley, son of Matthew Stuart, earl of Lennox, who had suffered an exile of twenty years in expiation of his intrigues with England, and had married the niece of King Henry VIII., daughter of his sister Margaret, the widow of James IV., by her second husband, the earl of Angus. Queen Elizabeth, with the almost incredible want of tact or instinctive delicacy which distinguished and disfigured her vigorous intelligence, had recently proposed as a suitor to the queen of Scots her own low-born favourite, Lord Robert Dudley, the widower if not the murderer of Amy Robsart; and she now protested against the project of marriage between Mary and Darnley. Mary who had already married her kinsman in secret at Stirling Castle with Catholic rites celebrated in the apartment of David Rizzio, her secretary for correspondence with France, assured the English ambassador, in reply to the protest of his master, that she had twenty days to take place for three months, when a dispensation from the pope would allow the cousins to be publicly united without offence to the Church. On the 29th of July 1565 they were accordingly remarried at Holyrood. The hapless and worthless bridegroom had already incurred the hatred of two powerful enemies, the earls of Morton and GLENCAIRN; but the former of these took part with the queen against the forces raised by Murray, Glencairn and others, under the nominal leadership of Hamilton, duke of Chatelherault, on the double plea of danger to the new religion of the country, and of the illegal proceeding by which Darnley had been proclaimed king of Scots without the needful constitutional assent of the estates of the realm. Murray was ciated to attend the “raid” or array levied by the king and queen, and was duly denounced by public blast of trumpet for his non-appearance. He entered Edinburgh with his forces, but failed to hold the town against the guns of the castle, and fell back upon Dumfries before the advance of the royal army, which was now joined by James Hepburn, earl of Bothwell, on his return from a three years’
outlawed exile in France. He had been accused in 1562 of a plot to seize the queen and put her into the keeping of the earl of Arran, whose pretensions to her hand ended only when his insanity could no longer be concealed. Another new adherent was the son of the late earl of Huntly, to whom the forfeited honours of his house were restored a few months before the marriage of his sister to Bothwell. The queen now appealed to France for aid; but Castelnau, the French ambassador, replied to her passionate pleading by sober and earnest advice to make peace with the malcontents. This counsel was rejected, and in October 1565 the queen marched an army of 18,000 men against them from Edinburgh; their forces dispersed in face of superior numbers, and Murray, on seeking shelter in England, was received with contumely by Elizabeth, whose half-hearted help had failed to support his enterprise, and whose intercession for his return found at first no favour with the queen of Scots. But the conduct of the besotted boy on whom at their marriage she had bestowed the title of king began at once to justify the enterprise and to play into the hands of all his enemies alike. His father set him on to demand the crown matrimonial, which could at least have been conceded to him the rank and station of the dependent nobility for life. Rizzio hinted to his friendship and advocate, induced the queen to reply by a reasonable refusal to this hazardous and audacious request. Darnley at once threw himself into the arms of the party opposed to the policy of the queen and her secretary—a policy which at that moment was doubly and trebly calculated to exasperate the fears of the religious and the pride of the patriotic. Mary was invited if not induced by the king of Spain to join his league for the suppression of Protestantism; while the actual or prospective endowment of Rizzio with Morton's office of chancellor, and the projected attaint of Murray and his allies, combined to inflame at once the anger and the apprehension of the Protestant nobles. According to one account, Darnley privately assured his uncle George Douglas of his wife's infidelity; he had himself, if he might be believed, discovered the secretary in the queen's apartment at midnight, under circumstances yet more unequivocally compromising than those which had brought Chastelard to the scaffold. Another version of the painful history represents Douglas as inflicting suspicion of Rizzio into the empty mind of his nephew, and thus winning his consent to a deed already designed by others. A bond was drawn in which Darnley pledged himself to support the confederates who undertook to punish "certain privy persons" offensive to the state, "especially a strange Italian, called Davie"; another was subscribed by Darnley and the banished lords, then biding their time in Newcastle, which engaged him to procure their pardon and restoration, while pledging them to insure to him the enjoyment of the title he coveted, with the consequent security of an undisputed succession to the crown, despite the counter claims of the house of Hamilton, in case his wife should die without issue—a result which, intentionally or not, he and his fellow-conspirators did all that brutality could have suggested to accelerate and secure. On the 9th of March the palace of Holyrood was invested by a troop under the command of Morton, while Rizzio was dragged by force out of the queen's presence and slain without trial in the heat of the moment. The parliament was discharged by proclamation issued in the name of Darnley as king; and in the evening of the next day the banished lords, whom it was to have condemned to outlawry, returned to Edinburgh. On the day following they were graciously received by the queen, who undertook to sign a bond for their security, but delayed the subscription till next morning under plea of sickness. During the night she escaped with Darnley, whom she had already seduced from the party of his accomplices, and arrived at Dunbar on the third morning after the slaughter of her favourite. From thence they returned to Edinburgh on the 28th of March, guarded by two thousand horsemen under the command of Bothwell, who had escaped from Holyrood on the night of the murder, to raise a force on the queen's behalf with his usual soldiery promptitude. The slayers of Rizzio fled to England, and were outlawed; Darnley was permitted to protest his innocence and denounce his accomplices; after which he became the scorn of all parties alike, and few men dared or cared to be seen in his company. On the 10th of June a son was born to his wife, and in the face of his previous protestations he was induced to acknowledge himself the father. But, as Murray and his partisans returned to favour and influence no longer incompatible with that of Bothwell and Huntly, he grew desperate enough with terror to dream of escape to France. This design was at once frustrated by the queen's resolution. She summoned him to declare his reasons for it in presence of the French ambassador and an assembly of the nobles; she besought him for God's sake to speak out, and not spare her; and at last he left her presence with an avowal that he had nothing to allege. The favour shown to Bothwell had not yet given occasion for scandal, though his character as an adventurous libertine was as notable as his reputation for military hardihood; but as the summer advanced his insolence increased with his influence at court and the general aversion of his rivals. He was richly endowed by Mary from the greater and lesser spoils of the church; and the three wardships of the border, united for the first time in his person, gave him the left hand of Scotland in position of unequalled power. In the gallant discharge of its duties he was dangerously wounded by a leading outlaw, whom he slew in single combat; and while yet confined to Hermitage Castle he received a visit of two hours from the queen, who rode thither from Jedburgh and back through 20 miles of the wild borderland where her person was in perpetual danger from the freebooters whom her father's policy had driven and had failed to extirpate. The result of this daring ride was a ten days' fever, after which she removed by short stages to Cragimmillar, where a proposal for her divorce from Darnley was laid before her by Bothwell, Murray, Huntly, Argyle and Lethington, who was chosen spokesman for the rest. She assented on condition that the divorce could be lawfully effected without impeachment of her son's legitimacy; whereupon Lethington undertook in the name of all present that she should be rid of her husband without any prejudice to the child—at whose baptism a few days afterwards Bothwell took the place of the putative father, though Darnley was actually residing under the same roof, and it was not till after the ceremony that he was suddenly struck down by a sickness so violent as to excite suspicions of poison. He was removed to Glasgow, and left for the time in charge of his father; but on the news of his progress towards recovery a bond was drawn up for execution of the sentence of death which secretly had been pronounced against the twice-turned traitor who had earned his doom at hands alike. On the 22nd of the next month (Jan. 1567) the queen visited her husband at Glasgow and proposed to remove him to Craigmillar Castle, where he would have the benefit of medicinal baths; but instead of this resort he was conveyed on the last day of the month to the lonely and squallid shelter of the residence which was soon to be made memorable by his murder. Between the ruins of two sacred buildings, with the town-wall to the south and a suburban hamlet known to ill fame as the Thieves' Row to the north of it, a lodging was prepared for the titular king of Scotland, and fitted up with tapestries taken from the Gordons after the battle of Corrichie. On the evening of Sunday, the 6th of February, Mary took her last leave of the miserable boy who had so often and so mortally outraged her as consort and as queen. That night the whole city was shaken out of sleep by an explosion of gunpowder which shattered to fragments the building in which he should have slept and perished and the next morning the bodies of Darnley and a page were found strangled in a garden adjoining it, whether they had apparently escaped over a wall, to be despatched by the hands of Bothwell's attendant confederates.

Upon a view which may be taken of Mary's conduct during the next three months depends the whole debateable question of her character. According to the professed champions of that character, this conduct was a tissue of such dastardly imbecility, such heartless irresolution and such brainless inconsistency as for ever to dispose of her time-honoured claim to the credit of intelligence and courage. It is certain that just three months
and six days after the murder of her husband she became the wife of her husband’s murderer. On the 21st of February she wrote to the bishop of Glasgow, her guardian in France, a brief letter of simple eloquence, announcing her providential escape from a design upon her own as well as her husband’s life. A reward of two thousand pounds was offered for proclamation for discovery of the murderer. Bothwell and others, his satellites or the queen’s, were instantly proclaimed by name as the criminals. Voices were heard by night in the streets of Edinburgh calling down judgment on the assassins. Four days after the discovery of the bodies, Darnley was buried in the chapel of Holyrood with secrecy, as remarkable as the solemnity with which Rizzio had been interred there less than a year before. On the Sunday following, Mary left Edinburgh for Seton Palace, 12 miles from the capital, where scandal asserted that she passed the time merrily in shooting-matches with Bothwell for her partner against Lords Seton and Huntly; other accounts represent Huntly and Bothwell as left at Holyrood in charge of the infant prince. Gracefully and respectfully, with statesmanlike yet feminine dexterity, the demands of Darnley’s father for justice on the murderers of his son were accepted and eluded by his daughter-in-law. Bothwell, with a troop of fifty men, rode through Edinburgh defiantly denouncing vengeance on his concealed accusers. As weeks elapsed without action on the part of the royal widow, while the cry of blood was up throughout the country, raising echoes from England and abroad, the murmur of accusation began to rise against her also. Murray, with his sister’s ready permission, withdrew to France. Already the report was abroad that the queen was bent on marriage with Bothwell, whose last year’s marriage with the sister of Huntly would be dissolved, and the assent of his wife’s brother purchased by the restitution of his forfeited estates. According to the Memoirs of Sir James Melville, both Lord Herries and himself resolved to appeal to the queen in terms of bold and earnest remonstrance against so desperate and scandalous a design; Herries, having been met with assurances of its unreasonableness and professions of a solemn understanding at the waktu, instantly fled from court; Melville, evading the danger of a merely personal protest without backers to support him, laid before Mary a letter from a loyal Scot long resident in England, which urged upon her consideration and her conscience the danger and disgrace of such a project yet more freely than Herries had ventured to do by word of mouth; but the sole result was that it needed all the queen’s courage and resolution to rescue him from the violence of the man for whom, she was reported to have said, she cared not if she lost France, England and her own country, and would go with him to the world’s end in a white petticoat before she would leave him. On the 28th of March the privy council, in which Bothwell himself sat, appointed the 12th of April as the day of his trial, Lennox, instead of the crown, being named as the accuser, and cited by royal letters to appear at “the humble request and petition of the said Earl Bothwell,” who, on the day of the trial, had 40 spearmen posted behind him in the streets, while the castle was also at his command. Under these arrangements it was not thought wonderful that Lennox discreetly declined the danger of attendance, even with 3000 men ready to follow him, at the risk of desperate street fighting. He pleaded sickness, asked for more time, and demanded that the accused, instead of enjoying special favour, should share the treatment of other suspected criminals. But, as no particle of evidence on his side was advanced, the protest of his representative was rejected, and Bothwell, acquitted in default of witnesses against him, was free to challenge any persistent accuser to the ancient ordeal of battle. His wealth and power were enlarged by gift of the parliament which met on the 14th and rose on the 19th of April—a date made notable by the subsequent supper at Airlie’s tavern, where Bothwell obtained the signatures of its leading members to a document affirming his innocence, and pledging the subscribers to maintain it against all challenges, to stand by him in all his quarrels and finally to promote by all means in their power the marriage by which they recommended the queen to reward his services and benefit the country. On the second day following Mary went to visit her child at Stirling, where his guardian, the earl of Mar, refused to admit more than two women in her train. It was well known in Edinburgh that Bothwell had a body of men ready to intercept her on the way back, and carry her to Dunbar—not, as was naturally inferred, without good assurance of her consent. On the 24th of April, as she approached Edinburgh, Bothwell accordingly met her at the head of 800 spearmen, assured her (as she afterwards averred) that she was in the utmost peril, and escorted her, together with Huntly, Lethington and Melville, who were then in attendance, to Dunbar Castle. On the 3rd of May Lady Jane Gordon, who had become countess of Bothwell on the 22nd of February of the year preceding, obtained, on the ground of her husband’s infidelities, a separation which, however, would not under the old laws of Catholic Scotland have left him free to marry again; on the 7th, accordingly, the necessary divorce was pronounced, after two days’ session, by a clerical tribunal which ten days before had received from the queen a special commission to give judgment on a plea of somewhat apocryphal consanguinity alleged by Bothwell as the ground of an action for divorce against his wife. The fact was studiously evaded or concealed that a dispensation had been granted by the archbishop of St Andrews for this irregularity, which could only have arisen through some illicit connexion of the husband with a relative of the wife between whom and himself no affinity by blood or marriage could be proved. On the day when the first or Protestant divorce was pronounced, Mary and Bothwell returned to Edinburgh with every prepared appearance of a peaceful triumph. Lest her captivity should have been held to invalidate the late legal proceedings in her name, proclamation was made of forgiveness accorded by the queen to her captor in consideration of his past and future services; and her intention was announced to reward them by further promotion; and on the same day (May 12), he was duly created duke of Orkney and Shetland. The duke, as a conscientious Protestant, refused to marry his mistress according to the rites of her Church; and, when offered the cause, agreed to be married to him, not merely by a Protestant but by one who before his conversion had been a Catholic bishop, and should therefore have been more hateful and contemptible in her eyes than any ordinary heretic, had no religion as well as policy, faith as well as reason, been absorbed or superseded by some more mastering passion or emotion. This passion or emotion, according to those who deny her attachment to Bothwell, was simply terror—the blind and irrational prostration of an abject spirit before the cruel force of circumstances and the crafty wickedness of men. Hitherto, according to all evidence, she had shown herself on all occasions, as on all subsequent occasions she indisputably showed herself, the most fearless, the most keen-sighted, the most ready-witted, the most high-gifted and high-spirited of women; gallant and generous, skilful and practical, never to be cowed by fortune, never to be cajoled by friends, nor yet, in her exultation, never to forget her own. She was, in her practice than might have been expected from her training and her creed. But at the crowning moment of trial there are those who assert their belief that the woman who on her way to the field of Corrichie had uttered her wish to be a man, that she might know all the hardship and all the enjoyment of a soldier’s life, riding forth “in jack and knapsack”—the woman who long afterwards was to hold her own for two days together without help of counsel against all the array of English law and English statesmanship, armed with irrefragible evidence and supported by the resentment of a nation—showed herself equally devoid of moral and of physical resolution; too senseless to realize the significance and too heartless to face the danger of a situation from which the simplest exercise of reason, principle or courage must have rescued the most unsuspecting and inexperienced of honest women who was not helplessly deficient in self-reliance and self-respect. The famous correspondence produced next year in evidence against her at the conference of York may have been, as her partisans affirm, so craftily garbled and falsified by interpolation, suppression, perversion, or
absolute forgery as to be all but historically worthless. Its acceptance or its rejection does not in any degree whatever affect, for better or for worse, the rational estimate of her character. The problem presented by the simple existence of the facts just summed up remains in either case absolutely the same.

That the coarse and imperious nature of the hardy and able Ruffian who had now become openly her master should no less openly have shown itself even in the first moments of their inauspicious union is what any bystander of common insight must inevitably have foreseen. Tears, dejection and passionate expressions of a despair "wishing only for death," bore fitful and variable witness to her first sense of a heavier yoke than yet had galled her spirit and her pride. At other times her affectionate gaiety would give evidence as trustworthy of a fearless and improvident satisfaction. They rode out in state together, and if he kept the right hand as a subject she would snatch it from him and clasp it on his head again; while in graver things she took all due or possible care to gratify his ambition, by the insertion of a clause in their contract of marriage which made their joint signature necessary to all documents of state issued under the sign-manual. She despatched to France a special envoy, the bishop of Dunblane, with instructions setting forth at length the unparalleled and hitherto ill-required services and merits of Bothwell, and the necessity of compliance at once with his passion and with the unanimous counsel of the nation—a people who would endure the rule of no foreign consort, and whom none of their own countrymen were so competent to control, alike by wisdom and by valour, as the incomparable subject of her choice. These personal merits and this political necessity were the only pleas advanced in a letter to her ambassador in England. But that neither plea would hold her for a moment in Scotland she had ominous evidence on the thirteenth day after her marriage, when no response was made to the usual form of proclamation for a raid or levy of forces under pretext of a campaign against the rievers of the border. On the 6th or 7th of June Mary and Bothwell took refuge in Borthwick Castle, twelve miles from the capital, where the fortress was in the keeping of an adherent whom the diplomacy of Sir James Melville had succeeded in detaching from his allegiance to Bothwell. The fugitives were pursued and beleaguered by the earl of Morton and Lord Hume, who declared their purpose to rescue the queen from the thraldom of her husband. He escaped, leaving her free to follow him or to join the party of her professed deliverers. But whatever cause she might have found since her marriage to come to terms with her captor and domestic brutality was insufficient to break the ties by which he held her. Alone, in the disguise of a page, she slipped out of the castle at midnight, and rode off to meet him at a tower two miles distant, whence they fled together to Dunbar. The confederate lords on entering Edinburgh were welcomed by the citizens, and after three hours' persuasion Lethington, who had now joined them, prevailed on the captain of the castle to deliver it also into their hands. Proclamations were issued in which the crime of Bothwell was denounced, and the disgrace of the country, the thraldom of the queen and the mortal peril of her infant son, were set forth as reasons for summoning all the lieges of the chief cities of Scotland to rise in arms on three hours' notice and join the forces assembled against the one common enemy. News of his approach reached them on the night of June 14, and they marched before dawn with 2000 men to meet him near Musselburgh. Mary meanwhile had passed from Dunbar to Haddington, and thence to Seton, where 1600 men rallied to her side. On the 15th of June, one month from their marriage day, the queen and Bothwell, at the head of a force of fairly equal numbers but visibly inferior discipline, met the army of the confederates at Carberry Hill, some six miles from Edinburgh. Du Croc, the French ambassador, obtained permission through the influence of Maitland to convey to the queen the terms proposed by their leaders—that she and Bothwell should part, or that he should meet in single combat a champion chosen from among their number. Bothwell offered to meet any man of sufficient quality; Mary would not assent. As the afternoon wore on their force began to melt away by desertion and to break up for lack of discipline. Again the trial by single combat was proposed, and thrice the proposal fell through, owing to objections on this side or on that. At last it was agreed that the queen should yield herself prisoner, and Bothwell be allowed to retire in safety to Dunbar with the few followers who remained to him. Mary took leave of her first and last master with passionate anguish and many parting kisses; but in face of his enemies, and in hearing of the cries which burst from the ranks, demanding her death by fire as a murderess and harlot, the whole heroic and passionate spirit of the woman, represented by her admirers as a spiritless imbecile, flamed out in responsive threats to have all the men hanged and crucified, in whose power she now stood helpless and alone. She grasped the hand of Lord Lindsay as he rode beside her, and swore, "by this hand" she would "have his head for this." In Edinburgh she was received by a yelling mob, who flaunted before her at each turn a banner representing the corpse of Darnley with her child beside it invoking on his knees the retribution of divine justice. From the violence of a multitude in which women of the worst class were more furious than the men she was sheltered in the house of the provost, where she repeatedly showed herself at the window, appealing aloud with dishevelled hair and dress to the mercy which no man could look upon her and refuse. At nine in the evening she was removed to Holyrood, and thence to the port of Leith, where she embarked under guard, with her attendants, for the island castle of Loch-leven. On the 20th a silver casket containing letters and French verses, miscalled sonnets, in the handwriting of the queen, was taken from the person of a servant who had been sent by Bothwell to bring it from Edinburgh to Dunbar. Even in the existing versions of these letters, translated from the lost originals and retranslated from this translation of a text which was probably destroyed in 1605 by order of King James on his accession to the English throne—even in these possibly disfigured versions, the fiery pathos of passion, the fierce and piteous fluctuations of spirit between love and hate, hope and rage and jealousy, have an eloquence apparently beyond the imitation or invention of art (see CASKET LETTERS). Three days after this discovery Lord Lindsay, Lord Ruthven and Sir Robert Melville were despatched to Lochleven, there to obtain the queen's signature to an act of abdication in favour of her son, and another appointing Murray regent during his minority. She submitted, and a commission of regency was established till the return from France of Murray, who, on the 15th of August, arrived at Lochleven, after a long passage from Scotland. According to the terms of the agreement, the exposituals as to her past conduct, which preceded his admonitions for the future were received with tears, confessions and attempts at extenuation or excuse; but when they parted next day on good terms she had regained her usual spirits. Nor from that day forward had they reason to sink again, in spite of the close keeping in which she was held, with the daughters of the house for bedfellows. Their mother and the regent's, her father's former mistress, was herself not impervious to her prisoner's lifelong power of seduction and subjugation. Her son George Douglas fell inevitably under the charm. A rumour transmitted to England went so far as to assert that she had proposed him to their common half-brother Murray as a fourth husband for herself; a later tradition represented her as the mother of a child by him. A third report, at least as improbable as either, asserted that a daughter of Mary and Bothwell, born about this time, lived to be a nun in France. It is certain that the necessary removal of George Douglas from Lochleven enabled him to devise a method of escape for the prisoner on the 27th of March, 1568, which was frustrated by detection of her white hands under the disguise of a laundress. But a younger member of the household, Willie Douglas, aged eighteen, whose devotion was afterwards remembered and his safety cared for by Mary at a time of utmost risk and perplexity to herself, succeeded on the 2nd of May in assisting her to escape by a
postern gate to the lake-side, and thence in a boat to the main-
land, where George Douglas, Lord Seton and others were wait-
ing her. Thence they rode to Seton's castle of Niddry, and
next day to Hamilton palace, round which an army of 6000 men
was posted here assembled, and whither the French ambassador
to Scotland hastened to pay his duty. The queen's abdication
was revoked, messengers were despatched to the English and
French courts, and word was sent to Murray at Glasgow that
he must resign the regency, and should be pardoned in common
with all offenders against the queen. But on the day when
Mary arrived at Hamilton Murray had summoned to Glasgow
the feudalatories of the Crown to take arms against the insurgent
enemies of the infant king. Elizabeth sent conditional offers
of help to her kinswoman, provided she would accept of English
intervention and abstain from seeking foreign assistance; but
the messenger came too late. Mary's followers had failed to
retake Dunbar Castle from the regent, and made for Dumbarton
instead, marching two miles south of Glasgow, by the village
of Langside. Here Murray, with 4500 men, under leaders of
high distinction, met the 6000 of the queen's army, whose ablest
man, Herries, was as much distrusted by Mary as by every one
else, while the Hamiltons could only be trusted to think of their
own interests, and were suspected of treasonable designs on all
who were friends to the queen, her house, and the monarchy. On the 13th
of May the battle was fought in hope of victory, by which the
campaign in three-quarters of an hour. Kirkaldy of Grange, who commanded
the regent's cavalry, seized and kept the place of vantage from the beginning, and at the first sign
of wavering on the other side shattered at a single charge the
forces of the queen with a loss of one man to three hundred.
Mary fled 60 miles from the field of her last battle before she
halted at Sanquhar, and for three days of flight, according to
her own account, had to sleep on the hard ground, live on oat-
meal and sour milk, and fare at night like the owls, in hunger,
cold and fear. On the third day from the rout of Langside she
crossed the Solway and landed at Workington in Cumberland,
May 16, 1568. On the 20th Lord Scrope and Sir Francis
Knollys were sent from court to carry messages and letters of
comfort from Elizabeth to Mary at Carlisle. On the 11th of
June Knollys wrote to Cecil at once the best description and
the noblest panegyric extant of the queen of Scots—enlarging,
with a brave man's sympathy, on her indifference to form and cere-
mony, her daring grace and openness of manner, her frank
display of a great desire to be avenged of her enemies, her readiness
to engage in action, her inherent delights to hear of hardihood and courage, commanding by name all her enemies
of approved valour, sparing no cowardice in her friends, but
above all things thirsting for victory by any means at any price,
so that for its sake pain and peril seemed pleasant to her, and
wealth and all things, if compared with it, contemptible and vile.
What was to be done with such a princess, whether she were to be
nourished in one's bosom, above all whether it could be advisable
or safe to try any diplomatic tricks upon such a lady, Knollys
left for the minister to judge. It is remarkable that he should
not have discovered in her the qualities so obvious to modern
champions of her character—casiness, gullibility, incurable
innocence and invincible ignorance of evil, incapacity to suspect
or resent anything, readiness to believe and forgive all things.
On the 13th of July, after various delays interposed by her reluct-
tance to leave the neighbourhood of the border, where on her
arrival she had received the welcome and the homage of the
leading Catholic houses of Northumberland and Cumberland,
she was removed to Bolton Castle in North Yorkshire. During
her stay here she was disturbed in her hope of victorie, in her
own and Elizabeth's commissioners and those appointed to
represent her son as a king of Scots. These latter, of whom
Murray himself was the chief, privately laid before the English
commissioners the contents of the famous casket. On the 24th
of October the place of the conference was shifted from York to
London, where the inquiry was to be held before Queen Elizabeth
in council. Mary was already aware that the chief of the English
commissioners, the duke of Norfolk, was secretly an aspirant to
the peril of her hand; and on the 21st of October she gave the
first sign of assent to the suggestion of a divorce from Bothwell.
On the 26th of October she resigned the charge of complicity in the murder
of Darnley, and was not only brought forward against her in spite of
Norfolk's reluctance and Murray's previous hesitation. Eliza-
abeth, by the mouth of her chief justice, formally rebuked the
audacity of the subjects who durst bring such a charge against
their sovereign, and challenged them to advance their proofs.
They complied by the production of an indictment under five
heads, supported by the necessary evidence of documents. The
number of English commissioners was increased, and they were bound
to preserve secrecy as to the matters revealed. Further
Evidence was supplied by Thomas Crawford, a retainer of
the house of Lennox, tallying so exactly with the text of the casket
letters as to have been cited in proof that the latter must needs
be a forgery. Elizabeth, on the close of the evidence, invited
Mary to reply to the proofs alleged before she could be admitted
to her presence; but Mary simply desired her commissioners to
withdraw from the conference. She declined with scorn the pro-
posal made by Elizabeth through Knollys, that she should sign
a second abdication in favour of her son. On the 10th of January,
1569, the judgment given at the conference acquainted Murray and
his adherents of rebellion, while affirming that nothing had been
proved against Mary—a verdict accepted by Murray as equiva-
lent to the public declaration of her innocence. The infant
king. This position he was not long to hold; and the fierce
exultation of Mary at the news of his murder gave to those who
believed in her complicity with the murderer, on whom a pension
was bestowed by her unblushing gratitude, fresh reason to fear,
if her liberty of correspondence and intrigue were not restrained,
the likelihood of a similar fate for Elizabeth. On the 26th of Jan-
uary 1569 she had been removed from Bolton Castle to Tutbury
in Staffordshire, where proposals were conveyed to her, at the
instigation of Leicester, for a marriage with the duke of Nor-
folk, to which she gave a graciously conditional assent; but the dis-
covey of these proposals consigned Norfolk to the Tower, and
on the outbreak of an insurrection in the north Mary, by Lord
Hunsdon's advice, was again removed to Coventry, when a body
of her intending deliverers was within a day's ride of Tutbury.
On the 23rd of January following Murray was assassinated; and a
second northern insurrection was crushed in a single sharp fight
by Lord Hunsdon. In October Cecil had an interview with Mary
at Chatsworth, when the conditions of her possible restoration
were to the throne were submitted to with French demands were debated.
The offer of marriage of Sir John Herries was refused, and Mary
stated that she would only be willing to yield the castles of Edinburgh and Dumbarton into English
keeping, or to deliver up her fugitive English partisans then in
Scotland; upon other points they came to terms, and the articles
were signed the 16th of October. On the same day Mary wrote to
Elizabeth, requesting with graceful earnestness the favour of an
interview which might reassure her against the suggestion that
this treaty was a mere pretence. On the 28th of November she
was removed to Sheffield Castle, where she remained for the next
fourteen years in charge of the earl of Shrewsbury. The detection
of a plot, in which Norfolk was implicated, for the invasion
of England by Spain on behalf of Mary, who was then to take
her as the fourth and most contemptible of her husbands, made
necessary the reduction of her household and the stricter
confinement of her person. On the 28th of May 1572 a
demand from both houses of parliament for her execution
as well as Norfolk's was generously rejected by Elizabeth;
but after the punishment of the traitorous pretended
to her hand, on whom she had lavished many eloquent letters
of affectionate entreaties, she wrote to her, entreating that
Mary should be sent back to Scotland for immediate execution, was broken off by the
death of the earl of Mar, who had succeeded Lennox as regent;
nor was it found possible to come to acceptable terms on a like
understanding with his successor Morton, who in 1577 sent a
proposal to Mary for her restorarion, which she declined, in

MARY QUEEN OF SCOTS 821
suspicion of a plot laid to entrap her by the policy of Sir Francis Walsingham, the most unscrupulously patriotic of her English enemies, and of her English relatives. Whether four years afterwards sent word to Scotland that the execution of Morton, so long the ally of England, would be answered by the execution of Mary. But on that occasion Elizabeth again refused her assent either to the trial of Mary or to her transference from Sheffield to the Tower. In 1581 Mary accepted the advice of Catherine de' Medici and Henry III. that she should allow her son's title to reign as king of Scotland conjointly with herself when released and restored to a share of the throne. This plan was but part of a scheme including the invasion of England by her kinsman the duke of Guise, who was to land in the north and raise a Scottish army to place the released prisoner of Sheffield beside her son on the throne of Elizabeth. After the overthrow of the Scottish accomplices in this notable project, Mary poured forth upon Elizabeth a torrent of pathetic and eloquent reproach for the many wrongs she had suffered at the hands of her hostess, and pledged her honour to the assurance that she now aspired to no kingdom but that of heaven. In the spring of 1583 she retained enough of this saintly resignation to ask for nothing but liberty, without a share in the government of Scotland; but Lord Burghley not unreasonably feared that her release might lead to the detention of his mother. In 1584 the long-suffering earl of Shrewsbury was relieved of his fourteen years' charge through the involuntary good offices of his wife, whose daughter by her first husband had married a brother of Darnley; and their orphan child Arabella, born in England, of royal descent on the father's side, was now, in the hopeful view of her grandmother, a more plausible claimant than the king or queen of Scots to the inheritance of the English throne. In December 1583 Mary had laid before the French ambassador her first complaint of the slanders spread by Lady Shrewsbury and her sons, who were ultimately compelled to confess the falsehood of their imputations on the queen of Scots and her keeper. It was probably at the time when a desire for revenge on her calumniators made her think the opportunity good and safe for discharge of such a two-edged dart at the countess and the queen that Mary wrote, but abstained from dispatching, the famous and terrible letter in which, with many gracious excuses and professions of regret and attachment, she transmits to Elizabeth a full and vivid report of the hideous gossip that had been regarding her character and person at a time when the reporter or reporters was on friendly terms with her husband's royal charge. In the autumn of 1584 she was removed to Wingfield Manor under charge of Sir Ralph Sadler and John Somers, who accompanied her also on her next removal to Tutbury in January 1585. A letter received by her in that cold, dark and unhealthy castle, of which fifteen years before she had made painful and malodorous experience, assured her that her son would acknowledge her only as queen-mother, and provoked at once the threat of a parent's curse and an application to Elizabeth for sympathy. In April 1585 Sir Amyas Paulet was appointed to the office of which Sadler, accused of careless indulgence, had been requested to be relieved; and on Christmas Eve she was removed from the hateful shelter of Tutbury to the castle of Chartley in the same county. Her correspondence in cipher thence with her English agents abroad, intercepted by Walsingham and deciphered by her secretary, gave eager encouragement to the design for a Spanish invasion of England under the prince of Parma,—an enterprise in which she would do her utmost to make her son take an active part. By his refusal to accede to the Catholic nobles of Scotland to betray him into the hands of Philip, from whose tutelage he should be released only on her demand, or if after her death he should wish to return, nor then unless he had become a Catholic. But even these patriotic and maternal schemes to consign her child and re-consign the kingdom to the keeping of the Inquisition, incarnate in the widower of Mary Tudor, were superseded by the attraction of a conspiracy against the throne and life of Elizabeth. Anthony Babington, in his boyhood a ward of Shrewsbury, resident in the household at Sheffield Castle, and thus subjected to the charm before which so many victims had already fallen, was now induced to undertake the deliverance of the queen of Scots by the murder of the queen of England. It is maintained by those admirers of Mary who assume her to have been an almost absolute imbecile, gifted with the power of imposing herself on the world as a woman of unsurpassed ability, that, while cognisant of the plot for her deliverance by English rebels and an invading army of foreign auxiliaries, she might have been innocently unconscious that this conspiracy involved the simultaneous assassination of Elizabeth. In the conduct and detection of her correspondence with Babington, traitor was played off against traitor, and spies were utilized against assassins, with as little scruple as could be required or expected in the diplomacy of the time. As in the case of the casket letters, it is alleged that forgery was employed to inter-pole sufficient evidence of Mary's complicity in a design of which it is thought credible that she was kept in ignorance by the traitors and murderers who had enrolled themselves in her service,—that one who pensioned the actual murderer of Murray and a would-be murderer of Elizabeth was incapable of approving what her keen and practised intelligence was too blunt and torpid to anticipate as inevitable and inseparable from the general design. In August the conspirators were nettled, and Mary was arrested at the gates of her own residence, with the intention of a hunting party. At Tixall she was detained till her papers at Chartley had undergone thorough research. That she was at length taken in her own toils even such a dandil as her admirers depict her could not have failed to understand; that she was no such dastard as to desire or deserve such defen-ders the whole brief course of her remaining life bore consistent and irrefragable witness. Her first thought on her return to Chartley was one of loyal gratitude and womanly sympathy. She cheered the wife of her English secretary, now under arrest, with promises to answer for her husband to all accusations brought against him, took her new-born child from the mother's arms, and in default of clergy baptized it, to Paulet's Puritanic horror, with her own hands by her own name. The next or the twin-born impulse of her indomitable nature was, as usual in all times of danger, one of passionate and high-spirited defiance on discovering the seizure of her papers. A fortnight afterwards her keys and her money were confiscated, while she, bedridden and unable to move her hand, could only pity the terrible weapon of her bitter and fierce tongue. What remained of her was consumed in consuming the practice of them gave evidence that she had first heard of the conspiracy by letter from Babington, of whose design against the life of Elizabeth she thought it best to take no notice in her reply, though she did not hold herself bound to reveal it. On the 29th of September she was removed to the strong castle of Fotheringay in Northamptonshire. On the 6th of October she was desired by letter from Elizabeth to answer the charges brought against her before certain of the chief English nobles appointed to sit in commission on the cause. In spite of her first refusal to submit, she was induced by the arguments of the vice-chamberlain, Sir Christopher Hatton, to appear before this tribunal on condition that her protest should be registered against the legality of its jurisdiction over a sovereign, the next heir of the English crown. On the 14th and 15th of October 1586 the trial was held in the hall of Fotheringay Castle. Alone, "without one counsellor on her side among so many," Mary conducted the whole of her own defence with courage incomparable and unsurpassable ability. Patience, and indignation and self-control, the elements of all successful and political reasoning, were the alternate weapons with which she fought against all odds of evidence or inference, and disputed step by step every inch of debatable ground. She repeatedly insisted on the production of proof in her own handwriting as to her complicity with the project of the assassins who had expired their crime on the 20th and 21st of the month preceding. When the charge was shifted to the question of her intrigues with Spain, she took her stand resolutely on her own right to convey whatever right she possessed, though now no kingdom was left her for disposal, to whomsoever she might choose. One single slip she made in the whole course of
her defence; but none could have been more unlucky characteristic and significant. When Burghley brought against her the unanswerable charge of having at that moment in her service, and in receipt of an annual pension, the instigator of a previous attempt on the life of Elizabeth, she had the unawary audacity to cite in her justification the pensions allowed by Elizabeth to her adversaries in Scotland, and especially to her son. It is remarkable that just two months later, in a conversation with her keepers, she again made use of the same extraordinary argument in reply to the same implausible imputation, and would not be brought to admit that the two cases were other than parallel. But except for this single instance of oversight or perversity her defence was throughout a masterpiece of indomitable ingenuity, of delicate and steadfast courage, of womanly dignity and genius. Finally she demanded, as she had demanded before, a trial either before the estates of the realm lawfully assembled or else before the queen in council. So closed the second day of the trial; and before the next day's work could begin a note of two or three lines hastily written at midnight informed the commissioners that Elizabeth had suddenly determined to adjourn the expected judgment and transfer the place of it to the star-chamber. Here, on the 25th of October, the commissioners again met; and one of them alone, Lord Zouch, dissented from the verdict by which Mary was found guilty of having, since the 1st of June preceding, compassed and imagined divers matters tending to the destruction of Elizabeth. This verdict was conveyed to her, about three weeks later, by Lord Buckhurst and Robert Beale, clerk of the privy council. At the Intimation that her life was an impediment to the security of the received religion, "she seemed with a certain unwonted alacrity to triumph, giving God thanks, and rejoicing in her heart that she was held to be an instrument" for the restoration of her own faith. This note of exultation as in martyrdom was maintained with unflinching courage to the last. She wrote to Elizabeth and the duke of Guise two letters of almost matchless eloquence and pathos, admirable especially for their loyal and grateful remembrance of all her faithful servants. Between the date of these letters and the day of her execution wellnigh three months of suspense elapsed. Elizabeth, fearless almost to a fault in face of physical danger, constant in her confidence even after discovery of her narrow escape from the poisoned bullets of household conspirators, was cowardly even to a crime in face of subtler and more complicated peril. She rejected with resolute dignity the intercession of French envoys for the life of the queen-dowager of France; she allowed the sentence of death to be proclaimed and welcomed with bonfires and bell-ringing throughout the length of England; she yielded a respite of twelve days to the pleading of the French ambassador, and had a charge trumped up against him of participation in a conspiracy against her life; at length, on the 1st of February 1587, she signed the death-warrant, and then made her secretaries write word to Paulet of her displeasure that in all this time he should not of himself have found out some way to shorten the life of her private, as it was believed he had done of other villains singularly under conscience from the guilt of bloodshed. Paulet, with loyal and regretful indignation, declined the disgrace proposed to him in a suggestion "to shed blood without law or warrant"; and on the 7th of February the ears of Shrewsbury and Kent arrived at Fotheringay with the commission of the council for execution of the sentence given against his prisoner. Mary received the announcement with majestic tranquillity, expressing in dignified terms her readiness to die, her consciousness that she was a martyr for her religion, and her total ignorance of any conspiracy against the life of Elizabeth. At night she took a graceful and affectionate leave of her attendants, distributed among them her money and jewels, wrote out in full the various legacies to be conveyed by her will, and charged her apothecary Gorion with her last messages for the king of Spain. In these messages the whole nature of the woman was revealed. Not a single friend, not a single enemy, was forgotten; the slightest service, the slightest wrong, had its place assigned in her faithful and implacable memory for retribution or reward.

Forgiveness of injuries was as alien from her fierce and loyal spirit as forgetfulness of benefits; the destruction of England and its liberties by Spanish invasion and conquest was the strongest aspiration of her parting soul. At eight next morning she entered the hall of execution, having taken leave of the weeping envoy from Scotland, to whom she gave a brief message for her son; took her seat on the scaffold, listened with an air of even cheerful unconcern to the reading of her sentence, solemnly declared her innocence of the charge conveyed in it and her consolation in the prospect of ultimate justice, rejected the professional services of Richard Fletcher, dean of Peterborough, lifted up her voice in Latin against his in English prayer, and when he and his fellow-worshippers had fallen duly silent prayed aloud for the prosperity of her own church, for Elizabeth, for her son, and for all the enemies whom she had commended overnight to the notice of the Spanish invader; then, with no less courage than had marked every hour and every action of her life, received the stroke of death from the wavering hand of the headman.

Mary Stuart was in many respects the creature of her age, of her creed, and of her station; but the noblest and most noteworthy qualities of her nature were independent of rank, opinion or time. Even the detractors who defend her conduct on the plea that she was a dastard and a dupe are compelled in the same breath to retract this implied reproach, and to admit, with illogical accusation and incongruous applause, that the world never saw more splendid courage at the service of more brilliant intelligence, that a braver if not "a rarer spirit never did steer humanity." A kinder or more faithful friend, a deadlier or more dangerous enemy, it would be impossible to dread or to desire. Passion alone could shake the double fortress of her impregnable heart and ever-active brain. The passion of love, after very sufficient experience, she apparently and naturally outlived; the passion of hatred and revenge was as inextinguishable in her inmost nature as the emotion of loyalty and gratitude. Of repentance it would seem that she knew as little as of fear, having been trained from her infancy in a religion where the Decalogue was supplanted by the Creed. Accept as she was in the most exquisite delicacy of dissimulation, the most sblent note of her original disposition was daring rather than subdety. Beside or behind the voluptuous or intellectual attractions of beauty and culture, she had about her the fresher charm of a fearless and frank simplicity, a genuine and enduring pleasure in small and harmless things no less than in such as were neither. In 1562 she amused herself for some days by living "with her little troop" in the house of a burgess of St Andrews "like a burgess's wife," assuring the English ambassador that he should not find the queen there,—"nor I know not myself where she is become." From Sheffield Lodge, twelve years later, she applied to the archbishop of Glasgow and the cardinal of Guise for some pretty little dogs, to be sent her in baskets very warmly packed,—"for besides reading and working, I take pleasure only in all the little animals that I can get." No less than reconciling time, no extent of comparative indulgence, could bring her in to resignation, submission, or toleration of even partial restraint. Three months after the massacre of St Bartholomew had caused some additional restrictions to be placed upon her freedom of action, Shrewsbury writes to Burghley that "rather than continue this imprisonment she sticks not to say she will give her body, her son, and country for liberty"; nor did she ever show any excess of regard for any of the three. For her own freedom of will and of way, of passion and of action, she cared much; for her creed she cared something; for her country she cared less than nothing. She would have flung Scotland with England into the hell fire of Spanish Catholicism rather than forgo the faintest chance of personal revenge. Her profession of a desire to be instructed in the doctrines of Anglican Protestantism was so transparently a pious fraud as rather to afford confirmation than to arouse suspicion of her fidelity to the teaching of her church. Elizabeth, so shamefully inferior in personal loyalty, fidelity and gratitude, was as clearly her superior on the one all-important point of patriotism. The
saving salt of Elizabeth's character, with all its well-known incredible mixture of heroism and egotism, meanness and magnificence, was simply this, that she found herself a woman, and was not content to be for although her actions were national and political, the high public virtue of a public servant; in the private and personal qualities which attract and attach a friend to his friend and a follower to his leader, no man or woman was ever more constant and more eminent than Mary Queen of Scots. (A. C. S.)

Bibliography.—The biography of Mary Stuart being virtually the history of Scotland during the period covered by her life, with which the history of England at the same period is also largely concerned, the chief events in which she figured are related in all the general histories of both countries. The most important original authorities are the volumes of the State Papers of the period, with other MS. documents preserved at the British Museum, the Cambridge University Library, Hatfield and elsewhere. See especially the Reports of the Hist. MSS. Commission; Calendar of State Papers, London, 1883-1900; Calendar of the Queen's Letters (London, 1885); F. T. Henderson, The Casket Letters and Mary Queen of Scots (Edinburgh, 1886); and Andrew Lang, The Mystery of Mary Stuart (London, 1900).

In 1896 Giovanni Savarino published a play La Maria Stuarda, and since then the story of the Queen of Scots has been the subject of numerous poems and dramas, of which the most celebrated are Schiller's Maria Stuart, and three tragedies by T. S. Eliot—The Hound of the Baskervilles (1865), Bothwell (1874), and Mary Stuart (1881).

MARY (1457—1582), duchess of Burgundy, only child of Charles the Bold, duke of Burgundy, and his wife Isabella of Bourbon, was born on the 15th of February 1457. As heiress of the rich Burgundian domains her hand was eagerly sought by a number of princes. When her father fell upon the field of Nancy, on the 5th of January 1477, Mary was not yet twenty years of age. Louis XI. of France seized the opportunity afforded by his rival's defeat and death to take possession of the duchy of Burgundy as a fief lapsed to the French crown, and also of Francony Comté, Picardy and Artois. He was anxious that Mary should marry the Dauphin Charles and thus secure the inheritance of the Netherlands for his descendants. Mary, however, distrustted Louis; declined the French alliance, and turned to her Netherlands subjects for help. She obtained their support only at the price of great concessions. On the 11th of February 1477 she was compelled to sign a charter of rights, known as "the Great Privileges," by which the provinces and towns of the Netherlands recovered all the losses which had been imposed upon them by the decrees of 1477, and which had been abolished by the arbitrary decrees of the dukes of Burgundy in their efforts to create in the Low Countries a centralized state. Mary had to undertake not to declare war, to make peace, or raise taxes without the consent of the States, and not to employ any but natives in official posts.

Mary now made her choice among the many suitors for her hand, and selected the archduke Maximilian of Austria, afterwards the emperor Maximilian I., and the marriage took place at Ghent on the 18th of August 1477. Affairs now went more smoothly in the Netherlands, the French aggression was checked, and the internal peace was in a large measure restored, when the duchess met her death. She was found dead in her horse on the 27th of March 1482. Three children had been the issue of her marriage, and her elder son, Philip, succeeded to her dominions under the guardianship of his father.

See E. Münch, Maria von Burgund, nebst d. Leben v. Margaretha v. York (2 vols., Leipzig, 1832), and the Cambridge Mod. Hist. (vol. i., c. xii., bibliography, 1903).

MARY (1496—1533), queen of France, was the daughter of Henry VIII of England and Elizabeth of York. At first it was intended to marry her to Charles of Austria, the future emperor Charles V., and by the treaty of Calais (Dec. 21, 1507) it was agreed that the marriage should take place when Charles should have attained the age of fourteen, the contract being secured by bonds taken from various princes and cities in the Low Countries. On the 17th of December 1508 the Sieur de Bergues, who had come over as Charles's representative at the head of a magnificent embassy, married the princess by proxy. The contract, originally made by Henry VII., was renewed on the 17th of October 1513 by Henry VIII. at a meeting with Margaret of Savoy at Lille, the wedding being fixed for the following year. But the emperor Maximilian I., to whom Louis XII. had promised his daughter Renée as wife for Charles, with Brittany for dowry, refused to comply with the English princess in a way that left no doubt of his intention to withdraw from the contract altogether. He was forestalled by the diplomacy of Wolsey, at whose instance peace was signed with France on the 7th of August 1514, and on the same date a treaty was concluded for the marriage of Mary Tudor with Louis XII., who had recently lost his wife Anne of Brittany. The marriage was celebrated...
at Abbeville on the 9th of October. The bridegroom was a broken man of fifty-two; the bride a beautiful, well-educated and charming girl of eighteen, whose heart was already engaged to Charles Brandon, duke of Suffolk, her future husband. The political marriage was, however, no long one. Mary was crowned queen of France on the 5th of November 1544; on the 1st of the month following King Louis died. Mary had only been induced to consent to the marriage with Louis by the promise that, on his death, she should be allowed to marry the man of her choice. But there was danger that the agreement would not be kept. In France the dukes of Lorraine and Savoy were mentioned as possible suitors, and meanwhile the new king, Francis I., was making advances to her, and only desisted when she confessed to him her previous attachment to Suffolk. The duke himself was at the head of the embassy which came from England to congratulate the new king, and to the detriment of his political mission he used the opportunity to win the hand of the queen. Francis good-naturedly promised to use his influence in her favour; Henry VIII. himself was not averse to the match, but Mary feared the opposition of the lords of the council, and, in spite of Suffolk's promise to the king not to take any steps in this direction, returned to England. Her secret was made known to her secretly before he left Paris. On their return to England in April, Suffolk was for a while in serious danger from the king's indignation, but was ultimately pardoned through Wolsey's intervention, on payment of a heavy fine and the surrender of all the queen's jewels and plate. The marriage was publicly solemnized at Greenwich on the 15th of May 1545. Suffolk had been already twice married, and his first wife was still alive. He thought it necessary later on (1528) to obtain a bull from Pope Clement VII. declaring his marriage with his first wife invalid and his union with Mary therefore canonical. Mary's life after this was comparatively uneventful. She lived mainly in the retirement of the country, but shared from time to time in the festivities of the court, and was present at the Field of the Cloth of Gold. She died on the 24th of June 1533. By the duke of Suffolk she had three children: Henry, born on the 11th of March 1516, created earl of Lincoln (1525), who died young; Frances, born on the 16th of July 1517, the wife of Henry Grey; marquess of Northampton, and mother of Lady Jane Grey (g.v.); and Jane, sister.

MARY OF LORRAINE (1515-1560), generally known as MARY OF GUISE, queen of James V. and afterwards regent of Scotland, was born at Bar on the 22nd of November 1515. She was the eldest child of Claude de Guise and Antoinette of Bourbon, and married in 1534 Louis II. of Orleans, duke of Longueville, to whom in 1535 she bore a son, Francis (d. 1551). The duke died in June 1537, and Mary was sought in marriage by James V., whose wife Magdalene died in July, and by Henry VIII. after the death of Jane Seymour. Henry persisted in his offers after the announcement of her betrothal to James V. Mary, who was made by adoption a daughter of France, received a papal dispensation for her marriage with James, which was celebrated by proxy in Paris (May 1538) and at Stirling in Scotland in July. Their two sons, James (b. May 1540) and Robert or Arthur (b. April 1541), died within a few days of each other in April 1541, and her husband died in December 1542, within a week of the birth of his daughter and heiress, Mary, Queen of Scots. Cardinal David Beton, the head of the French and Catholic party and therefore Mary of Lorraine's friend and ally, produced a will of the late king in which the primacy in the regency was assigned to himself. John Knox accused the queen of undue intimacy with Beton, and a popular report of a similar nature, probably unfounded, was revived in 1543 by Sir Ralph Sadler, the English envoy. Beton was arrested and the regency fell to the heir presumptive James, earl of Arran, whose inclinations were towards England and the Protestant party, and who hoped to secure the hand of the infant princess for his own son. Mary of Lorraine was approached by the English commissioner, Sir Ralph Sadler, to induce her to further her daughter's marriage contract with Edward VI. She informed Sadler that Arran had asked her whether Henry had made propositions of marriage to herself, and that she had stated that "if Henry should mind or offer her such an honour she must account herself much bounden." Sadler further learnt that she was "singularly well affected to Henry's desires." The marriage treaty between Mary, not then one year old, and Edward VI. was signed on the 1st of July at Greenwich, and guaranteed that Mary should be placed in Henry's keeping when she was ten years old. The queen dowager and her daughter were carefully watched at Linlithgow, but on the 23rd of July 1543 they escaped, with the help of Cardinal Beton, to the safer walls of Stirling castle. After the queen's coronation in September Mary of Lorraine was made principal member of the council appointed to direct the affairs of the kingdom. She was constantly in communication with her kinsmen in France, and was already planning to secure for her daughter a French alliance, which was opposed on different grounds by all her advisers. She made fresh alliances with the earl of Arran and Sir George Douglas, and in 1544 she made a proposal of marriage for her daughter to the duke of Lorraine, an undertaking which was brought about by Cardinal Beton. The assassination of Beton left her the cleverest politician in Scotland. The English invasions of 1547, undertaken with a view to enforcing the English marriage, gave Mary the desired pretext for a French alliance. In June 1548 a French fleet, with provisions and 5000 soldiers on board, under the command of André de Montaubert, seigneur d'Étée, landed at Leith to reinforce the Scots army, and laid siege to Haddington, then in the hands of the English. The Scottish parliament agreed to the marriage of the young queen with the dauphin of France, and, on the plea of securing her safety from English designs, she set sail from Dumbarton in August 1548 to complete her education at the French court.

Mary of Lorraine now gave her energies to the expulsion of the English and to the difficult task of keeping the peace between the Scots and their French auxiliaries. In September 1549 she visited France and obtained from Henry II. the confirmation of the dukedom and revenues of Châtellerault for the earl of Arran, in the hope of inducing him to return to Scotland. On her way back to Scotland she was driven by storms to Portsmouth harbour and paid a friendly visit to Edward VI. Arran refused, however, to relinquish the regency until April 1554, when he resigned after receiving an assurance of his rights to the succession. The new regent had to deal with an empty exchequer and with a strong opposition to her daughter's marriage with the dauphin. The gift of high offices of state to Frenchmen lent to the Protestant opposition the aspect of a national resistance to foreign domination. The hospitality of Arran and his brother Archbishop Hamilton forced Mary into friendly relations with the lords who favoured the Protestant party. Soon after her marriage miners had been brought from Lorraine to dig for gold at Crawford Moor, and she now carried on successful mining enterprises for coal and lead, which enabled her to meet the expenses of her government. In 1554 she took into her service William Maitland of Lethington, who as secretary of state obtained very great influence over her. She also provoked a dangerous enemy in John Knox by her expressed contempt for a letter which he had written to her, but the first revolt against her authority arose from an attempt to establish a standing army. When she provoked a war with England in 1557 the nobles refused to cross the border. In matters of religion she at first tried to hold the balance between the Catholic and Protestant factions and allowed the Presbyterian preachers the practice of their religion so long as they refrained from public preachings in Edinburgh and Leith. The marriage of Francis II. and her daughter Mary in 1558 strengthened her position, and in 1559 she relinquished her conciliatory tactics to submit to the dictation of her relatives, the Guises, by falling more into line with their religious policy. She was reconciled with Archbishop Hamilton, and
took up arms against the Protestants of Perth, who, incited by Knox, had destroyed the Charterhouse, where many of the Scottish kings were buried. The reformers submitted on condition that no foreign garrison was to be imposed on Perth and that the religious questions in dispute should be brought before the Scottish parliament. Mary of Lorraine broke the spirit of this agreement by garrisoning Perth with Scottish troops in the pay of France. The lords of the Congregation soon assembled in considerable force on Cupar Muir. Mary retreated to Edinburgh and thence to Dunbar, while Edinburgh opened its gates to the reformers, who issued a proclamation (Oct. 21, 1559) claiming that the regent was deposed. The lords of the Congregation sought help from Elizabeth, while the regent had recourse to France, where an expedition under her brother, René of Lorraine, marquis of Elbeuf, was already in preparation.

Mary, with the assistance of a French contingent, began to fortify Leith. The strength of her opponents was increased by the defection of Châtelet-Huart and his son Arran; and an even more serious danger was the treachery of her secretary Maitland, who betrayed her plans to the lords of the Congregation. In October 1559 they made an unsuccessful attack on Leith and the seizure of an English convoy on the way to their army by James Hepburn, earl of Bothwell, increased their difficulties. Mary was at this time living with her mother, Isabel (Edinburgh, 1846); J. Strickland, Les Derniers Stuarts à Saint-Germain en-Laye (London, 1871); and Martin Haie Mary of Modena (London, 1905).

MARY OF ORANGE (1641–1660), eldest daughter of the English king Charles I., was born in London on the 4th of November 1641. Her father wished her to marry a son of Philip IV., king of Spain, while her cousin, the elector palatine, Charles Louis, was also a suitor for her hand, but both proposals fell through and she became the wife of a Dutch prince, William, son of Frederick Henry, prince of Orange. The marriage took place in London on the 2nd of May 1641, but owing to the tender years of the bride it was not consummated for several years. However in 1642 Mary crossed over to Holland with her mother, Queen Henrietta Maria, and in 1644, as the daughter-in-law of the stadtholder, she began to take her place in public life. In 1647 her husband, William II., succeeded his father as stadtholder, but the crafty policy of his preceptors to capture Amsterdam, where he was born and died, afterwards the English king William III., being born to him a few days later (Nov. 14, 1650). Mary was obliged to share the guardianship of her infant son with his grandmother Amelia, the widow of Frederick Henry, and with Frederick William, elector of Brandenburg; moreover, she was unpopular with the Dutch owing to her sympathies with her kinsfolk, the Stuarts, and at length public opinion having been further angered by the hospitality which she showed to her brothers, Charles II. and James, duke of York, she was forbidden to receive her relatives. From 1654 to 1657 the princess passed most of her time away from Holland. In 1657 she was appointed regent on behalf of her son for the principality of Orange, but the difficulties of her position led her to implore the assistance of Louis XIV., and the French king answered by seizing Orange himself. The position both of Mary and of her son in Holland was greatly bettered through the restoration of Charles II. in Great Britain. In September 1660 Mary journeyed to England. She was taken ill of small-pox, and died in London on the 24th of December 1660, her death, says Bishop Burnet, being “not much lamented.”

MARYBOROUGH, a market town and the county town of Queen's County, Ireland. Pop. (1901), 2957. It lies in the broad lowland east of the Slieve Bloom mountains, on the river Triigue, an affluent of the Barrow, and on the main line of the Great Southern & Western railway, by which it is 51 m. W.S.W. of Dublin. The town was chosen as county town in the reign of Mary (1556), in whose honour both town and county received their names. Its charter was granted in 1570.
MARYBOROUGH—MARYLAND

but its present appearance, save a bastion of the ancient castle, is wholly modern. There are flour-mills and a considerable general trade. Maryborough returns two members to the Irish parliament from 1585 until the union in 1800. The singular lofty rock of Dunnamore or Dunabbey, about 3 m. from the town, bears on its summit extensive ruins of a castle, originally belonging to the kings of Leinster, but probably built in the main by William Bruce (c. 1200) and dismantled in 1650 by Cromwell's troops.

MARYBOROUGH, a town of March county, Queensland, Australia, on the left bank and 25 m. from the mouth of the Mary river, 180 m. by rail N. of Brisbane. Pop. (1901), 10,150. Besides a handsome court-house and town hall, the principal buildings are a hospital, a technical college, a library, the Anglican Church of St Paul with a fine tower and peal of bells, and the grammar schools. There is a large shipbuilding yard, and breweries, distilleries, a tannery, boot factories, soap works, saw-mills, flour-mills, carriage works and iron foundries, besides extensive sugar factories in the neighbourhood. The largest smelting works in Australia are 3 m. distant, itself that from one of the chief smelting works. Maryborough is the port of a valuable district for a wide agricultural district yielding maize and sugar, and also for the Gympie gold-fields. Timber abounds in the neighbourhood and is exported. Maryborough is also the second coaling port in Queensland, the government railway wharf being in direct communication with the Burrum coal-fields.

MARYBOROUGH, a municipal town of Talbot county, Victoria, Australia, 112 m. by rail N.W. of Melbourne. Pop. (1901), 5653. It has fine government buildings, a town hall, a botanical garden, and numerous park lands. It is an important railway centre, and has extensive railway workshops, as well as coach factories, breweries and foundries. The gold mining of the district is deep alluvial. Wheat, oats and wine are the chief agricultural products of the neighbourhood.

MARYLAND, a South Atlantic state of the United States, and one of the original thirteen, situated between latitudes 35° 53' and 39° 44' N. and longitudes 75° 4' and 79° 35' W. (the precise western boundary has not been determined. It is bounded N. by Pennsylvania and Delaware; E. by Delaware and the Atlantic Ocean; S. and W. by the Potomac river and its north branch, which separate it, except on the extreme W. border, from Virginia and West Virginia; W. also, by West Virginia. It is one of the small states of the Union—only seven are smaller—its total area being 12,327 sq. m. of which 2380 sq. m. are water.

Physical Features.—Maryland is crossed from north to south by each of the leading topographical regions of the east section of the United States—the Coastal Plain, the Piedmont Plateau, the Appalachian Mountains, and the Allegheny Mountain region. The Potomac river (c. 180 ft. D.C.), the Susquehanna and several others from the Piedmont Plateau by way of Baltimore to a point a little south of the north-east corner of the state, and is divided by the Chesapeake Bay into two parts known as the East Shore and the West Shore. The East Shore is a low level plain, the least elevated section of the state. The Potomac river forms the boundary between the narrow sandy Choptank River, which encloses a shallow lagoon or bay also called Sinepunxent, the region that, except in the extreme north, it is very narrow, and Chincoteague at the south, which forms the boundary. Between 75° 7' W. and 75° 23' W. the Chesapeake to the west and north-west there is a slight general rise, a height of about 100 ft. being reached in the extreme north. A water-parting extending from north-east to south-west and close to the eastern boundary is the Patuxent river. These two rivers are rather sluggish; but generally north-west in the west section and south-west in the south section. In the south the navigation is long, the central portion of the river being navigable by vessels of moderate size; but generally north-west in the west section and south-west in the south section. In the south the navigation is long, the central portion of the river being navigable by vessels of moderate size; but generally north-west in the west section and south-west in the south section. In the south the navigation is long, the central portion of the river being navigable by vessels of moderate size; but generally north-west in the west section and south-west in the south section.

Climate.—The climate of Maryland in the south-east is influenced by ocean and bay—perhaps also by the sandy soil—while in the central and northern portions, the climate is somewhat more continental. All springs are mild; but generally north-west in the west section and south-west in the south section. The normal winter is mild, the normal summer rather hot; in the west the normal winter is cold, the normal summer is hot. The temperature for the entire state is between 53° and 54° F., ranging from 48° at Grantsville in the north-west to 73° at Harford in the north-east, and to 75° at Princeton in the east. The normal temperature for the state during July (the warmest month) is 72° F., and during January (the coldest month) 32° F. Although the west section is generally much cooler in summer, yet both of the greatest extremes recorded since 1891 were at points not far apart in Western Maryland; 109° F. at Boettcherville and —26° F. at Sunnyvale. The normal
Maryland.

Maryland is a state in the East North Central region of the United States. Its capital is Annapolis, and its largest city is Baltimore. Maryland is bordered by Delaware, Pennsylvania, Virginia, West Virginia, and the Chesapeake Bay.

Soils and Agriculture.

The great variety of soils is one of the most striking characteristics of Maryland. On the East Shore to the north is a marly loam covering a yellowish-red sub-soil, to the south is a soil quite similar in character but with more clay, while there, especially in the middle and south, and throughout the counties of the Piedmont Plateau east of Fanny's Ridge, the underlying formations are the sandstone of the Cambrian system. In the Hagerstown Valley are red or yellow limestone-clay soils. The Allegheny ridges have only a thin stony soil; but good limestone, sandstone, shale and alluvial soils, occur in the valleys and in some of the plateaus of the extreme western part of the state.

The total land surface of the state 82% was in 1900 included in farms and 68% of the farmland was improved. There were 46,012 farms, of which 15,383 contained less than 50 acres, 39,240 contained between 50 and 250 acres, and 7,689 contained 250 acres or more; the average size being 112.4 acres. In 1890, 69% of the farms were worked by the owners or their managers, in 1900 only 66.4%; but share tenants outnumber cash tenants by almost three to one. Of the farm population, 6.7% is made up of negroes; they are very largely operated by white as by negro farmers, though the number of farms operated by white share tenants outnumber those operated by negro share tenants by only about five to one. Of all the inhabitants of the state, white and negro, the 10-year old, was the group in no other state except South Carolina is so large a per cent. of the value of the crop expended for fertilizers. In 1907, according to the Year Book of the U.S. Department of Agriculture, the Indian corn crop of the state was valued at $22,333,000, of which 14,763,000 bushels, valued at $131,720,000; the oat crop was 82,500 bushels, valued at $423,000; and the crop of rye was 35,000 bushels, valued at $250,000. Of the livestock, hogs were the leading agricultural animal, followed by chickens. The hay and forage crop of 1890 (exclusive of corn-stalks) grew on 374,848 acres. Until after the middle of the 19th century the tobacco was the staple crop of Maryland, and the total yield did not reach 20,000,000 pounds until 1880. The 1880 yield was 51,000,000; from this it decreased to 14,000,000, or 12,336,000 lbs. in 1889; in 1890 it rose again to 24,589,400 lbs, in 1907 the crop was only 16,962,000 lbs, less than that of nine other states. In Maryland, the area of tobacco, chiefly Indian corn, is 60,000 acres, and in 1890 sixteenth among the states of the Union, the crop being valued at $1,746,760, one of the highest of any sort of tobacco. In 1895 the yield both of strawberries and of tomatoes it ranked first; the yield of pears and nectarines the state ranked thirteenth in 1899; in the yield of pears it ranked fifth; in apples twentieth.

The Indian-corn, wheat and livestock sections of the state, are in the two large counties, the Hagerstown Valley and the central portion of the East Shore. Garrett county in the extreme north-west, however, raises the largest number of sheep. Most of the tobacco is grown in the south counties of the West Shore. The great centres for apples and pears are in the counties bordering on the north-west shore of the Chesapeake, and in Howard, Frederick and Washington counties, directly west, and Anne Arundel county producing the second largest quantity of strawberries of all the counties in the Union in 1899. Peaches and pears grow in large quantities in Kent and neighboring counties on the East Shore and in Washington and Frederick counties; apples grow in abundance in Montgomery and Monocacy counties.

Soils and Agriculture. The woodland area of the state was in 1900 4,400 sq. m., about 44% (estimated in 1907 to be 3,450 sq. m., about 35%) of the total area, but with the exception of considerable oak and chestnut, the timber is largely old-growth. Though the amount of the merchantable timber has been cut. The lumber industry, nevertheless, has steadily increased in importance, the value of the product in 1890 amounting to only $605,864, that in 1890 to $2,514,516, and in 1907 it was valued at $3,452,956. The value of products under the factory system; in 1905 the value of the factory product was $2,750,339.

Fisheries. In 1897 the value of the fishery product of Maryland was exceeded only by the Canadian fisheries. In 1907 the value of the fishery product of Maryland was exceeded only by the Canadian fisheries. In 1907 the value of the fishery product of Maryland was exceeded only by the Canadian fisheries. In 1907 the value of the fishery product of Maryland was exceeded only by the Canadian fisheries. In 1907 the value of the fishery product of Maryland was exceeded only by the Canadian fisheries. In 1907 the value of the fishery product of Maryland was exceeded only by the Canadian fisheries. In 1907 the value of the fishery product of Maryland was exceeded only by the Canadian fisheries. In 1907 the value of the fishery product of Maryland was exceeded only by the Canadian fisheries. In 1907 the value of the fishery product of Maryland was exceeded only by the Canadian fisheries. In 1907 the value of the fishery product of Maryland was exceeded only by the Canadian fisheries.
and meat-packing; cars and repairs by steam railways; shirts; cotton goods; malt liquors; and cigars and cigarettes. In the value of fertilizers manufactured, and in that of oysters canned and preserved, Maryland was first among the states in 1900 and second in 1880. Tobacco is still a very important product, particularly in the value of men's clothing. Baltimore is still the great manufacturing centre, but of the state's total product the percentage in value of that manufactured there decreased from 82.5% in 1890 to 66.5% in 1900. Most of the factories are located in or near Baltimore, but the chief manufacturing towns are Philadelphia, Baltimore & Washington. The largest secondary centres are Cumberland, Hagerstown and Frederick; the total value of whose products in 1905 was less than $10,000,000.

Communications.—Tide-water Maryland is afforded rather unusual facilities of water transportation by the Chesapeake Bay, with its deep channel, numerous deep inlets and navigable tributaries, together with the Chesapeake and Delaware Canal, which crosses the peninsula into Maryland and connects the head of the Delaware river and bay. As early as 1733 steps were taken to extend these facilities to the navigable waters of the Ohio, chiefly by improving the navigation of the Potomac above Georgetown. By 1820 this project was merged into a movement for a Chesapeake and Ohio canal along the same line. Ground was broken in 1828 and in 1830 the canal was opened to navigation from Georgetown to Cumberland, a distance of 186 m. In 1875 and again in 1889 it was wrecked by a freshet, and since then has been little service. However, on the same day that ground was broken for this canal, the site was also selected for the Baltimore & Ohio railway, of which 15 m. was built in 1828-1830 and which was one of the first steam railway lines in operation in the United States. Building was prosecuted steadily. In Maryland (and including the District of Columbia) there were 259 m. of railway in 1850, 386 m. in 1860, 671 m. in 1870, and 1040 m. in 1880; in 1905 the mileage was 1270 m. and in 1909 it was 1394-19 m. The first Baltimore & Potomac (as the line was known from its connections with the Compagnie du Nord-Atlantic, Philadelphia, Baltimore & Washington (controlled by the Pennsylvania and a consolidation of the Philadelphia, Wilmington & Baltimore, and the Baltimore & Potomac), the Western Maryland, the Western Maryland Central & Pittsburgh (leased by the Western Maryland), the Northern Central, the Maryland electric railways (including what was formerly the Baltimore & Annapolis Short Line), and the Washington, Baltimore & Annapolis electric railway. Baltimore is the centre of the railway system and its harbour is one of the most important in the country.

Inhabitants.—The population of Maryland in 1880 was 839,843; in 1890, 1,042,390, an increase of 11.5%; in 1900, 1,188,044 (14%); in 1910, 1,295,346 (increase 9%). Of the total population in 1900 there were 952,474 whites, 235,064 negroes, 544 Chinese, 0 Japanese and 3 Indians, the increase in the white population from 1890 to 1900 being 15.2%, while that of the negroes was only 9%. In 1900 there were 1,094,110 native born to 93,944 foreign-born, and of the foreign-born 24,990 were natives of Germany and 68,600 were residents of the city of Baltimore. The urban population, i.e. total population of cities of 4000 or more inhabitants, in 1900, was 572,795, or 48.2% of the total and an increase of 16.6% over that of 1890; while the rural population increased 35.2% and was chosen as the most practicable route for a proposed ship waterway between the Chesapeake and the Delaware. The population at previous censuses was as follows: 319,728 in 1790; 341,458 in 1800; 360,546 in 1810; 407,350 in 1820; 447,040 in 1830; 470,019 in 1840; 583,034 in 1850; 687,049 in 1860; and 780,894 in 1870.

The chief executive authority is vested in a governor elected by popular vote for a term of four years. Since becoming a state Maryland had no lieutenant-governor except under the constitution of 1864; and the office of governor is to be filled in case of a vacancy by such person as the General Assembly may elect. Any citizen of Maryland may be elected to the office who is thirty years of age or over, who has been for ten years a citizen of the state, who has resided in the state for five years immediately preceding election, and who is at the time of his election a qualified voter therein. Until 1838 the governor had a rather large appointing power, but since that time the governor has been subject to the filling by the vote of counties and legislative districts, so that this measure, like the other primary law, is not sufficiently direct to give Baltimore a vote proportional to its population. He, however, still appoints, subject to the confirmation of the senate, the secretary of state, the superintendent of public education, the commissioner of the land office, the adjutant-general, and the members of the supreme court, the members of the members of the most numerous administrative boards, and other administrative officers. He is himself one of the board of education, of the board of public works, and of the board for the management of the house of correction. He is also the chief military officer for the state until the머니 1867, when, in the present constitution, it was provided that no bill vetoed by him should become a law unless passed over his veto by a two-thirds vote of the members elected to each house. The senate and the House of Delegates are elected for a term of two years, a. The electoral district of Baltimore is entitled to the number of delegates to which the largest county shall or may be entitled under the foregoing apportionment, and the General Assembly may from time to time alter the number of senators and representatives that shall be entitled to represent their population. This system of apportionment gives to the rural counties a considerable political advantage over the city of Baltimore, which, with 42.5% of the total population according to the census of 1900, has less than 10% of the seats in the House of Delegates. Since far back in the colonial era, no minister, preacher, or priest

The General Assembly regularly elected the governor during the period 1776–1838.
has been eligible to a seat in either house. A senator must be twenty-five years of age or over, and both senators and delegates must have lived within the state at least three years and in their county or legislative district at least one year immediately preceding their election.

The constitution provides that no bill or joint resolution shall pass either house except by an affirmative vote of a majority of all the members elected to that house and requires that on the final vote the yeas and nays be entered in the journals. These include the members appointed by the governor for a term of two years, not more than four to be reappointed. There is also a state lunacy commission of four members, who are appointed for terms of four years, one annually, by the governor.

Justice, &c.—The administration of justice is entrusted to a court of appeals, circuit courts, special courts for the city of Baltimore, orphans' courts, and justices of the peace. Exclusive of the circuit courts the residents of each county are divided into four judicial sections of which two are combined into a single circuit court of each of the several counties in such circuit. The courts have both original and appellate jurisdiction and are required to hold at least two sessions to which jurors shall be summoned every year. In each of its divisions, seven commissioners are held; there must be two other intermediate terms to which jurors shall not be summoned. Three other judges are elected for four-year terms, in each county and in the city of Baltimore to constitute the courts of general jurisdiction. A judge so elected, together with one elected from the city of Baltimore, constitute the court of appeals, the governor, with the advice and consent of the senate designating one of the eight as chief judge of that court. The court has appellate jurisdiction on its professional judge's tried cases. It also holds at least two terms in each county; but the justices of the peace may hold, in addition to their two terms, such special terms as may be called for by the county or city court. Each county has a board of elections, which is elected by the county or city court. The members appointed by the governor for a term of five years, and, as ex-officio members without the right to vote, the principals of the state and other normal schools. Prior to 1900 the president of the state normal school for men and the superintendents of the state normal schools for women have been appointed by the governor for a term of four years. Each county board is also appointed by the governor for a term of six years. In both the state and the county boards at least one-third of the members appointed by the governor are not to be of the same political party. Maryland supports no state membership, but be appointed every two years. The state board enacts by-laws for the administration of the system; its decision of controversies arising under the school law is final; it may suspend or remove a teacher for misconduct, dishonesty, or dereliction of duty; it is authorized to issue life state certificates, but applicants must have had seven years of experience in teaching, five in Maryland, and must hold a first-class certificate or a college or normal school diploma; and it pensions all non-affiliated teachers of the public or normal schools of the state, who have reached the age of sixty, and who have become physically or mentally incapable of teaching longer, the pension amounting to $200 a year. The law of 1904 providing that a teacher holding a first-class certificate should be $350 a year after three years' teaching, $400 after five years' teaching and $450 after eight years' teaching. By a law of 1904 all teachers who taught in normal schools in the state are entitled to a pension of $200 a year. In 1910 the law was amended to provide that if a teacher is employed in a normal school in the state, the pension shall be paid to the legal representative of the teacher on his death. In 1904 a law was passed providing that the state shall pay the cost of maintenance and instruction to all children between the ages of eight and twelve who are not employed at home or elsewhere. A separate school for negro children is to be maintained in every election district in which the negro population warrants it. The system is maintained by a state tax of 16 cents on each $100 of taxable property.

The higher state educational institutions are two normal schools and five colleges. The first normal school was opened in 1856 at Baltimore, the other at Frostburg in 1904. Both are under the management of the state Board of Education, which appoints the principals and teachers and prescribes the course of study.

MARYLAND

Education.—The basis of the present common school system was laid in 1865, after which a marked development was accompanied by some important changes in the system and its administration, and the percentage of total illiteracy (i.e., inability to write among whites over years old as from 7 to 40) fell from 100,000 in 1875 to 100,000 in 1887, and to 100,000 in 1897, and to 100,000 in 1897, and to 100,000 in 1897. At the head of the system is a state board and a state superintendent, elected by the general assembly for a term of years. A principal assistant superintendent has been appointed by the governor for a term of four years. Each county board is also appointed by the governor for a term of six years. In both the state and the county boards at least one-third of the members appointed by the governor are not to be of the same political party. Maryland supports no state membership, but be appointed every two years. The state board enacts by-laws for the administration of the system; its decision of controversies arising under the school law is final; it may suspend or remove a teacher for misconduct, dishonesty, or dereliction of duty; it is authorized to issue life state certificates, but applicants must have had seven years of experience in teaching, five in Maryland, and must hold a first-class certificate or a college or normal school diploma; and it pensions all non-affiliated teachers of the public or normal schools of the state, who have reached the age of sixty, and who have become physically or mentally incapable of teaching longer, the pension amounting to $200 a year. The law of 1904 providing that a teacher holding a first-class certificate should be $350 a year after three years' teaching, $400 after five years' teaching and $450 after eight years' teaching. By a law of 1904 all teachers who taught in normal schools in the state are entitled to a pension of $200 a year. In 1910 the law was amended to provide that if a teacher is employed in a normal school in the state, the pension shall be paid to the legal representative of the teacher on his death. In 1904 a law was passed providing that the state shall pay the cost of maintenance and instruction to all children between the ages of eight and twelve who are not employed at home or elsewhere. A separate school for negro children is to be maintained in every election district in which the negro population warrants it. The system is maintained by a state tax of 16 cents on each $100 of taxable property.

The higher state educational institutions are two normal schools and five colleges. The first normal school was opened in 1856 at Baltimore, the other at Frostburg in 1904. Both are under the management of the state Board of Education, which appoints the principals and teachers and prescribes the course of study.

In 1841 a divorce was granted by the legislature only, then until 1857 the courts granted natural divorces; after 1857, the courts granted legal divorces, since 1857 by the courts only. The grounds for a divorce a mensa et thoro, which may be granted for ever or for a limited time only, are cruelty, excessively vicious conduct, or desertion; for a divorce a vinculo matrimonii, which may be granted for periods longer than those of the above, are marriage, adultery or deliberate abandonment for three years. There is no homestead exemption law and exemptions from levy for the satisfaction of debts extend only to $100 worth of property, besides wearing apparel and books and tools used by the debtor in the trade; and each county poor is in the nature of insurance. Employers of workmen in a clay or coal mine, stone quarry, or on a steam or street railway are liable for damage in case of an injury to any of their workmen where such injury is caused by the neglect of the employer. The chief of the bureau of labour statistics is directed in case of danger of a strike or lockout to seek to mediate between the parties and if unsuccessful in that, then to endeavor to secure their consent to the formation of a board of arbitration.

The state penal and charitable institutions include a penitentiary at Baltimore; a house of correction at Jessups, two houses of refuge at Baltimore; a house of reformation in Prince George's county; St Mary's industrial school for boys at Baltimore; an industrial home for negro girls at Melville; an asylum and training school for the feeble-minded at Owings Mills; an infirmary at Cumberland; and a large detention house at Westminster. The state has the Springfield hospital for the insane; the Maryland school for the deaf and dumb at Frederick city; and the Maryland school for the blind at Baltimore. Each of these is under the management of the state, the trustees being appointed by the governor for terms of ten years or for life. Besides these there are a large number of state-aided charitable institutions. In 1905 there was created a board of state aid and charities, composed of seven members appointed by the governor for a term of two years, not more than four to be reappointed. There is also a state lunacy commission of four members, who are appointed for terms of four years, one annually, by the governor.

Revenue.—The state's revenue is derived from a general direct property tax, a licence tax, corporation taxes, a collateral inheritance
MARYLAND

831
tax, fines, forfeitures and fees; and the penitentiary yields an annual net revenue of about $40,000. There is no provision for a general periodic assessment, but a state tax commissioner appointed by the governor, treasurer and comptroller assesses the corporations, and the comptroller, in the name of the state, (in the city of Baltimore) revise valuations of real property every two years. From 1820 to 1836 Maryland, in its enthusiasm over internal improvements, incurred an indebtedness of more than $160,000.

To meet the interest, such heavy taxes were levied that anti-tax associations were formed to resist the collection, and in 1842 the state failed to pay what was due; but the accumulated interest had been funded by 1848 and was paid soon afterwards, the temporary want having been supplied by the sale of the outlet of 1851, and after the Civil War the amount of indebtedness steadily decreased until in 1902 the funded debt was $6,909,326 and the net debt only $2,707,269.13, while on the 1st of October 1908 the net debt was $14,709,000. The assessment of the state was established in 1790, and by 1817 there was one in each of twelve counties and several in Baltimore; in 1818-1820 and in 1837-1839 there were several serious bank failures, but there have been no serious failures since.

A constitutional provision makes each stockholder in a state bank liable to the amount of his share or shares for all the bank's debts and liabilities. A savings bank is taxed on its deposits, and a state bank is taxed on its capital stock.

History.—The history of Maryland begins in 1632 with the procedure of Charles I. to grant a charter conveying almost unlimited territorial and governmental rights therein to George Calvert, first Lord Baltimore (1587-1632), and styling him its absolute lord and proprietor. George Calvert died before the charter had passed the great seal, but about two months later in the same year it was issued to his eldest son, Cecilius. In November 1632 two vessels, the “Ark” and the “Dove,” carrying at least two hundred colonists under Leonard Calvert (c. 1582-1647), a brother of the proprietor, as governor, sailed from Gravesend and arrived in Maryland late in March of the following year.

Friendly relations were at the outset established with the Indians, and the province never had much trouble with that race; but with William Claiborne (1592-1667), the arch-enemy of the shipping as long as he lived, it was otherwise. He had opposed the grant of the Maryland charter, had established a trading post on Kent Island in Chesapeake Bay in 1631, and when commanded to submit to the new government he and his followers offered armed resistance. A little later, during his temporary absence in England, his followers on the island were reduced to submission; but in 1644, while the Civil War in England was in progress, he was back in the province assisting Richard Ingle, a pirate who claimed to be acting in the interest of parliament, in raising an insurrection which deprived Governor Calvert of his office for about a year and a half. Finally, the lord proprietor was deprived of his government from 1654 to 1658 in obedience to instructions from parliament which were originally intended to affect only Virginia, but were so modified, through the influence of Claiborne and some Puritan exiles from Virginia who had settled in Maryland, as to apply also to the plantation of Connecticut in New England. Then began the whirling unrest both in the mother country and in the province seems to have encouraged Josias Fendall, the proprietor's own appointee as governor, to strike a blow against the proprietary government and attempt to set up a commonwealth in its place; but this revolt was easily suppressed and order was generally preserved in the province from the English Restoration of 1660 to the English Revolution of 1688.

Meanwhile an interesting internal development had been in progress. The proprietor was a Roman Catholic and probably it was his intention that Maryland should be an asylum for persecuted Roman Catholics, but it is even more clear that he was desirous of having Protestant colonists also. To this end he promised religious toleration from the beginning and directed his officers accordingly; this led to the famous toleration act passed by the assembly in 1649, which, however, extended its protection only to sects of Trinitarian Christianity. Again, although the charter reserved to the proprietor the right of calling an assembly of the freemen or their delegates at such times and in such form and manner as he should choose, he surrendered in 1658 his claim to the sole right of initiating legislation. By 1650 the assembly had been divided into two houses, in one of which sat only the representatives of the freemen without whose consent no bill could become a law, and annual sessions as well as triennial elections were coming to be the usual order. When suffrage had thus come to be a thing really worth possessing, the proprietor, in 1670, sought to check the opposition by disfranchising all freemen who did not have a freehold of fifty acres or a visible estate of forty pounds sterling. But this step was followed by more and more impassioned complaints against him, such as: that he was interfering with elections, that he was summoning only a part of the delegates elected, that he was seeking to overawe those summoned, that he was abusing his veto power, and that he was keeping the government in the hands of Roman Catholics, who were mostly members of his own family. About this time also the north and east boundaries of the province were beginning to suffer from the aggressions of William Penn. The territory now forming the state of Delaware was within the boundaries defined by the Maryland charter, but in 1682 it was transferred by the duke of York to William Penn and in 1685 Lord Baltimore's claim to it was denied by an order in council, on the ground that it had been inhabited by Christians before the Maryland charter was granted. In the next place, although it was clear from the words of the charter that the parallel of 40° N. was intended for its north boundary, and although Penn's charter prescribed that Pennsylvania should extend to the south of the "beginning of the fortyth degree of Northern Latitude," a controversy arose with regard to the boundary between the two provinces, and there was a long period of litigation; in 1763-1767 Charles Mason and Jeremiah Dixon, two English mathematicians, established the line named from them (see MASON AND DIXON LINE), which runs along the parallel 39° 43' 26"-3 N. and later became famous as the dividing line between the free states and the slave states. While the proprietor was absent defending his claims against Penn the English Revolution of 1688 was started. Owing to the death of a messenger there was a delay in proclaiming the new monarchs in Maryland; this delay, together with a rumor of a Popish plot to slaughter the Protestants, enabled the opposition to overthrow the proprietary government, and then the crown, in the interest of its trade policy, set up a royal government in its place, in 1692, without, however, devestigating the proprietor of his territorial rights. Under the royal government the Church of England was established, the people acquired a strong control of their branch of the legislature and they were governed more by statute law and less by executive ordinance. The proprietor having become a Protestant, the proprietary government was restored in 1715. Roman Catholics were disfranchised immediately afterward. In 1730 Germans began to settle in considerable numbers in the west-central part of the colony, where they greatly promoted its industrial development but at the same time added much strength to the opposition forces. The first government by popular franchise which preceded the restoration of 1715 was with regard to the extension of the English statutes to Maryland, the popular branch of the legislature vigorously contending that all such statutes except those expressly excluded extended to the province, and the lord proprietor contending that only those in which the dominions were expressly mentioned were in force there. Many other disputes speedily followed and when the final struggle between the English and French for possession in America came, although appropriations were made at its beginning to protect her own west frontier from the attacks of the enemy, a deadlock between the two branches of the assembly prevented Maryland from responding to repeated appeals from the mother country for aid in the latter part of that struggle. This failure was used as an argument in favour of imposing the famous Stamp Act. Nevertheless, popular clamour against parliament on account of that measure was even greater than it had been against the proprietor. The stamp distributor was driven out, and the arguments of Daniel Dulany (1721-1797), the ablest lawyer in the province, against the act were quoted by speakers in parliament for its repudiation.
MARYLAND

In the years immediately preceding the Declaration of Independence Maryland pursued much the same course as did other leading colonies in the struggle—a vessel with tea on board was even burned to the water’s edge—and yet when it came to the decisive act of declaring independence there was hesitation. As the contest against the proprietor had been nearly won, the majority of the best citizens desired the continuance of the old government and it was not until the Maryland delegates in the Continental Congress were found almost alone in holding back that their instructions not to vote for independence were rescinded. The new constitution drawn and adopted in 1776 to take the place of the charter was of an aristocratic rather than a democratic nature. Under it the property qualification for suffrage was a freehold of 50 acres or £30 current money, the property qualifications for delegates £500, for senators £1000, and for governor £5000. Four delegates were chosen from each county and two each from Baltimore and Annapolis, the same as under the proprietary government, population not being taken into account. Senators were chosen by a college of fifteen electors elected in the same manner as the delegates, and the governor by a joint ballot of the two houses of assembly. In 1802 negroes were disfranchised, and in 1810 property qualifications for suffrage and office were abolished. The system of representation that, with the rapid growth of population in the north-east sections, especially in the city of Baltimore, placed the government in the hands of a decreasing minority also began to be attacked about this time; but the fear of that minority which represented the tobacco-raising and slave-holding counties of south Maryland, with respect to the attitude of the majority toward slavery prevented any changes until 1837, when the opposition awakened by the enthusiasm over internal improvements effected the adoption of amendments which provided for the election of the governor and senators by a direct vote of the people, a slight increase in the representation of the city of Baltimore, and a slight decrease in that of the smaller counties. Scarcely had these amendments been carried when the serious financial straits brought on by debt incurred through the state’s provision of internal improvements gave rise to the demand for a reduction of governmental expenses and a limitation of the power of the General Assembly to contract debts. The result was the new constitution of 1851, which fully established representation in the counties on the basis of population and further increased that of Baltimore. The constitution of 1851 was however chiefly a patchwork of compromises. So, when during the Civil War Maryland was largely under Federal control and the demand arose for the abolition of slavery by the state, another constitutional convention was called, in 1864, which framed a constitution providing that those who had given aid to the Rebellion should be disfranchised and that only those qualified for suffrage in accordance with the new document could vote on its adoption. This was too revolutionary to stand long and in 1867 it was superseded by the present constitution. In national affairs Maryland early took a stand of perhaps far-reaching consequences in refusing to sign the Articles of Confederation (which required the assent of all the states before coming into effect), after all the other states had done so (in 1779), until those states claiming territory between the Alleghany Mountains and the Mississippi and north of the Ohio—Virginia, New York, Massachusetts and Connecticut—should have surrendered such claims. As those states finally yielded, the Union was strengthened by reason of a greater equality and consequently less jealousy among the original states, and the United States came into possession of the first territory in which all the states had a common interest and out of which new states were to be created. In the War of 1812 Frederick, Havre de Grace, and Friendship were burned by the British; but particularly noteworthy were the unsuccessful movements of the enemy by land and by sea against Baltimore, in which General Robert Ross (c. 1766–1814), the British commander of the land force, was killed before anything had been accomplished and the failure of the fleet to take Fort McHenry after a siege of a day and a night inspired the song The Star-Spangled Banner, composed by Francis Scott Key who had gone under a flag of truce to secure from General Ross the release of a friend held as a prisoner by the British and during the attack was detained on his vessel within the British lines. In 1861 Maryland as a whole was opposed to secession but also opposed to coercing the seceded states. During the war that followed the west section was generally loyal to the north while the south section favoured the Confederacy and furnished many soldiers for its army; but most of the state was kept under Federal control, the writ of habeas corpus being suspended. The only battle of much importance fought on Maryland soil during the war was that of Sharpsburg or Antietam on the 16th and 17th of September 1862. As between political parties the state has usually been quite equally divided. From 1820 to 1860, however, the Whigs were in general a trifle the stronger; and from 1866 to 1895 the Democrats were triumphant; in 1865 a Republican governor was elected; in 1896 Maryland gave McKinley 32,232 votes more than it gave Bryan; and in 1904 seven Democratic electors and one Republican were chosen; and in 1908 five Democratic and three Republican.

The proprietors of Maryland were: Cecilus Calvert, second Lord Baltimore (1625–1675) from 1632 to 1675; Charles Calvert, third Lord Baltimore (1629–1715) from 1675 to 1715; Benedict Leonard Calvert, fourth Lord Baltimore (1684–1715) 1715; Charles Calvert, fourth Lord Baltimore (1699–1711) from 1715 to 1751; Frederick Calvert, sixth and last Lord Baltimore (1731–1771) from 1751 to 1771; Henry Harford, from 1771 to 1776.

Governer of Maryland.

Proprietary.

Leonard Calvert
Richard Ingle (usurer) 1633–1645
Edward Hill (chosen by the council) 1645
Leonard Calvert 1640–1647
Thomas Greene 1647–1652
William Stone 1652–1654
Richard Bennett (commissioners of parliament) 1652
Edmund Curtis 1654–1658
William Stone 1658–1660
William Fuller and others (appointed by the commissioners of parliament) 1657–1658
John Pendleton (titular) 1660–1661
Philip Calvert 1661–1664
Charles Calvert 1667–1671
Charles Calvert, third Lord Baltimore 1675–1676
William Claiborne (titular) and Jesse Wharton (real) 1676–1677
Thomas Notley 1676–1679
Charles Calvert, third Lord Baltimore 1679–1684
Benedict Leonard Calvert (titular) and council (real) 1683–1688
William Joseph (president of the council) 1688–1689
Protestant Associates under John Coode 1690–1692

Royal.

Sir Lionel Copley 1692–1693
Sir Edmund Andros 1693–1694
Francis Nicholson 1694–1699
Nathaniel Blackiston 1699–1700
Thomas Greene (president of the council) 1700–1704
John Seymour 1704–1709
Edward Lloyd (president of the council) 1709–1714
John Hart 1714–1715
John Hart 1715–1720
Charles Calvert 1720–1727
Benedict Leonard Calvert 1727–1731
Samuel Ogle 1731–1732
Ches Calvert, fifth Lord Baltimore 1732–1733
Samuel Ogle 1733–1742
Thomas Bladen 1742–1747
Samuel Ogle 1747–1752
Benjamin Tasker (president of the council) 1752–1753
Horatio Sharpe 1752–1759
Robert Eden 1759–1774
Robert Eden (nominal) and Convention and Council of Safety (real) 1774–1776

STATE

Thomas Johnson 1777–1779
Thomas Sim Lee 1779–1785
William Pala 1785–1788
William Smallwood 1785–1788
John Eager Howard 1788–1791
George Plater 1791–1792

1 Died in office.
MARYPORT—MASACCIO

C. Steiner, Maryland during the English Civil War (2 vols., Baltimore, 1906-1907), one of the Johns Hopkins University Studies. (N. D. M.)

MARYPORT, a market town and seaport in the Cockermouth parliamentary division of Cumberland, England, 25 m. W.S.W. of Carlisle, on the Maryport & Carlisle railway. Pop. of urban district (1901), 11,807. It is irregularly built on the shore of the Irish Sea and on the cliffs above, at the mouth of the river Ellen. Until 1770 there were only a few huts here, the spot being called Ellenfoot, but at this time the harbour was built by Humphrey Senhouse. In 1892 Maryport became an independent port with Workington, Whithaven and Milloc subordinate to it. Coal exports are exported from the mining district inland, and shipbuilding is carried on. There are also rope and sail works, iron-foundries, saw-mills, breweries and tanneries. On the hill north of the town there is a Roman fort which guarded the coast, and many remains of this period have been discovered. The fort was called Uxellodunum.

MARZABOTTO, a village of Emilia, Italy, in the province of Bologna, 17 m. S.S.W. of Bologna by rail. Pop. (1901), 617 (village); 5272 (commune). It lies in the valley of the Reno, 443 ft. above sea-level. In and below the grounds of the Villa Aria, close to it, are the remains of an Etruscan town of the 5th century B.C., protected on the west by the mountains, on the east and south by the river, which by a change of course destroyed about half of it. The acropolis was just below the villa: here remains of temples were found. The town lay below the modern high-road and was laid out on a rectangular plan divided by main streets into eight quarters, and these in turn into blocks or insulae. Cemeteries were found on the east and north of the site. The name of the place is unknown: it was partially inhabited later by the Gauls, but was not occupied by the Romans.

The discoveries of 1888-1889 (with references to previous works) are described by E. Briozzo in Monumenti dei Lincei (1891), i. 249 seqq. (T. A.)

MASACCIO (1402-1428), Italian painter. Tommaso Guidi, son of a notary, Ser Giovanni di Simone Guidi, of the family of the Scheckh, who had property in Castel S. Giovanni di Val d’Arno, was born in 1402 (according to Milanesi, on the 21st of December 1401), and acquired the nickname of Masaccio, which may be translated "Lubberly Tom," in consequence of his slovenly dressing and deportment. From childhood he showed a great inclination for the arts of design, and he is said to have studied under his contemporary Masolino da Panicale. In 1421, or perhaps 1422, he was enrolled in the guild of the speziali (druggists) in Florence, in 1424 in the guild of painters. His first attempts in painting were made in Florence, and then in Pisa. Next he went to Rome, still no doubt very young; although the statement that he returned from Rome to Florence, in 1426, when only eighteen or nineteen, seems incredible, considering the works he undertook in the papal city. These included a series of frescoes still extant in a chapel of the church of S. Clemente, a Crucifixion, and scenes from the life of St Catherine at S. Clemente, or perhaps some other saint. Though much inferior to his later productions, these paintings are, for realism and propriety of representation, in advance of their time.

Some critics, however, consider that the design only, if even that, was furnished by Masaccio, and the execution left to an inferior hand; this appears highly improbable, as Masaccio, at his early age, can scarcely have held the position of a master laying out work for subordinates; indeed Vasari says that Lubberly Tom was held in small esteem at all times of his brief life. In the Crucifixion subject the group of the Marys is remarkable; the picture most generally admired is that of Catherine, in the presence of Maxentius, arguing against and converting eight learned doctors. After returning to Florence, Masaccio was chiefly occupied in painting in the church of the Carmine, and especially in that of Brancacci, which is considered famous almost beyond rivalry in the annals of painting.

The chapel had been built early in the 15th century by Felice Michele di Piuichese Brancacci, a noble Florentine. Masaccio's work in it began probably in 1423, and continued at intervals until

11
he finally quitted Florence in 1428. There is a whole library-shelf of discussion as to what particular things were done by Masaccio and what by Masolino, and long afterwards by Filippino Lippi, in the Brancacci Chapel, and also as to certain other paintings by Masaccio, which appear to have disappeared; it contains portraits of Brancacci, Donatello and many others. In the cloister of the Carmine was discovered in recent years a portion of a fresco by Masaccio representing a procession; but this, being in colours and not in monochrome, does not appear to be the Brancacci procession. Regarding the works in the Brancacci chapel itself, the prevalent opinion now is that Masolino, who used to be credited with a considerable portion of them, did either nothing or at most the solitary compartment which bears his name. The rest is to life, and to the same saint healing a cripple. The share which Filippino Lippi bore in the work admits of little doubt; to him are due various items on which the fame of Masaccio ought in great part to be transferred to Filippino. What Masaccio did in the Brancacci Chapel bears with too great a show to be as follows, and is ample enough to sustain the high reputation he has always enjoyed: (1) the "Temptation of Adam and Eve"; (2) "Peter and the Tribute-Money"; (3) "The Expulsion from Eden," (4) "St. Peter Preaching"; (5) "Peter Baptizing"; (6) "Peter Almsgiving"; (7) "Peter and John curing the Sick"; (8) "Peter restoring to Life the Son of King Theophilus of Antioch." The subject already allotted to Masolino may perhaps be by Masaccio, and in that case it must have been one of the first in order of execution. A few words may be given to these pictures individually.

(1) The "Temptation of Adam and Eve." A monochrome, and strongly expressive composition, contains a head reputed to be the portrait of Masaccio himself, thought to be of a polymer, but full of life, a solid resolve countenance and a pointed beard. The "Expulsion was so much admired by Raphael that, with comparatively slight modifications, he adopted it as his own in one of the subjects of the Logge of the Vatican. (5) "Peter Baptizing" contains some nude figures in a strong natural style that is not unusual, and is prepared for the baptismal ceremony, which stands half-shivering in the raw air, has always been a popular favourite and an object of artistic study. (8) The restoration of the young man to life has been open to much discussion as to what subject was represented, but the most probable opinion is that the legend of King Theophilus was intended.

In 1427 Masaccio was living in Florence with his mother, then for the second time a widow, and with his younger brother Giovanni, a painter of no distinction; he possessed nothing but debts. In 1428 he was working, as we have seen, in the Brancacci chapel. Before the end of that year he disappeared from Florence, going, as it would appear, to Rome, to evade the importunities of creditors. Immediately afterwards, in 1429, when his age was twenty-seven or twenty-eight, he was reported dead. Poisoning by jealous rivals in art was rumoured, but of this nothing is known. The statement that several years afterwards, in 1443, he was buried in the Florentine Church of the Carmine, mentioned in no one of the old inventories and impossible to depend upon a confused account of the dates, which have now, after long causing much bewilderment, been satisfactorily cleared up from extant documents.

It has been said that Masaccio introduced into painting the plastic boldness of Donatello, and carried out the linear perspective of Paolo Uccello and Brunelleschi (who had given him practical instruction), and he was also the first painter who made some considerable advance in atmospheric perspective. He was the first to make the architectural framework of his pictures correspond in a reasonable way to the proportions of the figures. In the Brancacci chapel he painted with extraordinary swiftness. The contours of the feet and articulations in his pictures are imperfect; and his most prominent device for giving roundness to the figures (a point in which he made a great advance upon his predecessors) was a somewhat mannered way of putting down their flesh, an easy, and his landscape details natural, and superior to his age. In fact, he led the way in representing the objects of nature correctly, with action, liveliness and relief. Soon after his death, his work was recognized at its right value, and led to notable advances; and all the greatest artists of Italy, through studying the Brancacci chapel, became his champions and disciples.

Of the works attributed to Masaccio in public or private galleries hardly any are authentic. The one in the Florentine Academy, the "Virgin and Child in the Lap of St. Anna," is an exception. The portrait of St. Peter in the National Gallery is more probably Filippino Lippi; and Filippino, or Botticelli, may be the real author of the head, at first termed a Masaccio, in the National Gallery, London.

The only work by Masaccio that was that of T. Patch, Life with Engravings (Florence, 1770–1772). See Layard, The Brancacci Chapel, etc. (1868): H. Eckstein, Life of Masaccio, Gioio, etc. (1882): Charles Yiarte, Tommaso dei Guidi (1894). (W. M. R.)

MASAI, an Eastern Equatorial African people of Negro-Hamitic stock, speaking a Nilotic language. The Hamitic element, which is not great, has probably been derived from the Galla. The Masai were probably isolated in the high mountains or plateaus which lie between the Nile and the Karamojo country. There they originally had their home, and there to-day the Latuka, who show affinities with them, still live. The district south of Lake Victoria, where the Masai in the direction of Mount Elgon and Lake Rudolf, after some time, they split into two groups, the Masai proper and the Wa-Kuafi or agricultural Masai, and this at no very remote date, as the two tribes speak practically the same language. The more powerful Masai were purely nomadic and pastoral, their wealth consisting in cattle. The Wa-Kuafi, losing their cattle to their stronger kinsmen, split up again into the Burekenei, the Gwas Ngishu, and the Nyarusi (Enjamusi) and settled as agriculturalists. Meantime the Masai became masters of the greater part of inner East Africa from Ugo and the Unyamwezi countries on the south and west to Mount Kenya and Galland on the north, and eastward to the hundred-mile strip of more or less settled Bantu country on the coast of the Indian Ocean.

The Masai physical type is slender, but among the finest in Africa. A tall, well-made people, the men are often well over six feet, with slim wiry figures, chocolate-coloured, with eyes often slightly oblique like the Mongoloids, but the nose especially being often almost Caucasian in type, with well formed bridge and finely cut nostrils. Almost all the men and women knock out the two lower incisor teeth. For this custom they give the explanation that hawk’s beak was once very common in Masai-land, and that it was found to be easy to feed the sufferer through the gap thus made. All the hair on the body of both sexes is pulled out with iron tweezers; a Masai with a moustache or beard is unknown. The hair of the head is shaved in women and married men; but the hair of a youth at puberty is allowed to grow till it is long enough to have thin strips of leather plaited into it. In this way the hair, after a coating of red clay and mutton fat, is made into pigtails, the largest of which hangs down the back, another over the forehead, and one on each side. The warriors smear their whole bodies with the clay and fat, mixed in equal proportion.

No initiation or coming-of-age ceremony is performed on the men, but Sir Harry Johnston noticed women with parallel lines burnt into the skin round the eyes. In both sexes the lores of the ears are distended into great loops, through holes in which large disks of wood are thrust. Bead necklaces, beads, armlets, and arm bands are worn by men, and before marriage the Masai girl has thick iron rings on her legs so tightly as to check the calf development. The women wear dressed hides or calico; the old men wear a skin or cloth cape. The warriors wear red calico round their waists, a circle of ostrich feathers round their heads, for decoration. The wig is composed of long white fur round the knee. Masai houses are of two kinds. The agricultural tribes build round huts with walls of reeds or sticks, and conical, grass-thatched roofs. The true Masai nomads, however, usually live in the mud or worse huts, richly decorated. Long, low (not more than 6 ft. high), flat-roofed, they are built on a framework of sticks with strong partitions dividing the structure into separate compartments, each a dwelling, with low, oblong door. Mud and cow-dung are plastered on to the brushwood used in the roofing. Beds are made of brushwood neatly stacked and covered with hides. The fireplace is a circle of stones. The only furniture, besides cooking-pots, consists of long gourds used as milk-gourds as cups, and small three-legged stools cut out of a single block.
of wood and used by the elder men to sit on. The Masai are not hunters of big game except lions, but they eat the eland and kudu. The domestic animals are cattle, sheep, goats, donkeys and dogs. Only women and the married men smoke. The dead are ordinarily not buried, but laid on their backs on a light plastic bier, and the village and left on the ground to be devoured by hyenas, jackals and vultures. Important chiefs are buried, however, and a year later the eldest son or successor recovers the skull, which is treasured as a charm. A great deal of respect is paid to old men of the family, and the supreme chief is almost always a medicine man.

The Masai believe in a nature-god as a supreme being—Ngai ("sky")—and his aid is invoked in cases of drought by a ceremonial chant of the children, sometimes done in circular motions under a gum tree. The four ancestors. Their grass path. When Masai first came they were not a great bunched on the hand. They have creation-myths including four gods, the black, white, grey and red deities. They believe there common: for the first time, when when a Masai wanderer, they might gain the path of their original ancestors. A kind of worship is paid to the hyena in some districts: the whole tribe going into mourning if the beast crosses their path. The Masai also have a vague tree-worship, and grass is a sacred symbol. When making peace with a stranger, they settle by a heart-bomb and laid upon the grass, and when the warriors start out on a raid their sweethearts throw grass after them or lay it in the forks of trees. But the oldest of their superstitions is the importance attached to spitting. To spit on a person or thing is regarded as a sign of good will, as among other Nilotic tribes. Newly born children are spat on by every one who sees them. Johnston states that every Masai before extending his hand to him spat on it first. They spit when they cross a river, and they spit again with the same ceremony when returning the same way. Joseph Thomson writes, "Being regarded as a wizard of the first water, the Masai flocked to me ... and the more copiously I spat on them the greater was their delight. The Masai have no love for women, and they avoid them, as the woman is considered lower in the social scale than the man. The only thing that woman can do is to satisfy his personal needs; and trades such as smelting and forging are left to enslaved tribes such as the Dorobo (Wandorobo). These manufactory bears with long blades and butts and the peculiar swords or "bunji" are used by the Masai in their warfare, and are said to be broad at the point. Most of the Masai live in the British East Africa Protectorate.

MASANIELLO—MASCARA

MASANIELLO, an abbreviation of TOMMASO ANIELLO (1622—1647), an Amalfi fisherman, who became leader of the revolt against Spanish rule in Naples in 1647. Misgovernment and fiscal oppression having aroused much discontent throughout the two Sicilies, a revolt broke out at Palermo in May 1647, and the people of Naples followed the example of the Sicilians. The immediate occasion of the latter rising was a new tax on fruit, the ordinary food of the poor, and the chief instigator of the movement was Masaniello, who took command of the malcontents. The outbreak began on the 7th of July 1647 with a riot at the city gates between the fruit-vendors of the environs and the customs officers; the latter were forced to flee, and the customs office was burnt. The rioters then poured into Naples and forced their way into the palace of the viceroy, the hated Count d'Arcos, who had to take refuge first in a neighbouring convent, then in Castel Sant'Iago, and finally in Castelnuovo. Masaniello attempted to discipline the mob and restrain its vandalic instincts, and to some extent he succeeded; attended in his fisherman's garb, he gave audiences and administered justice from a wooden scaffolding outside his house. Several rioters, including the duke of Maddaloni, an opponent of the viceroy, and his brother Giuseppe Caraffa, who had come to Naples to make trouble, were condemned to death by him and executed. The mob, which every day obtained more arms and was becoming more intractable, terrorized the city, drove off the troops summoned from outside, and elected Masaniello "captain-general"; the revolt was even spreading to the provinces. Finally, the viceroy, whose negotiations with Masaniello had been frequently interrupted by fresh tumults, ended by granting all the concessions demanded of him. On the 13th of July, through the mediation of Cardinal Filomarino, archbishop of Naples, a convention was signed between D'Arcos and Masaniello as "leader of the most faithful people of Naples," by which the rebels were pardoned, the more oppressive taxes removed, and the citizens granted certain rights, including that of remaining in arms until the treaty should have been ratified by the king of Spain. The astute D'Arcos then invited Masaniello to the palace, confirmed his title of "captain-general of the Neapolitan people," gave him a gold chain of office, and offered him a pension. Masaniello refused the pension and laid down his dignities, saying that he wished to return to his old life as a fisherman; but he was entertained by the viceroy and, partly owing to the strain and excitement of the past days, partly because he was made dizzy by his astonishing change of fortune, or perhaps, as it was believed, because he was poisoned, he lost his head and behaved like a frenzied maniac. The populace continued to obey him for some days, until, abandoned by his best friends, who went over to the Spanish party, he was murdered while haranguing a mob on the market-place on the 16th of July 1647; his head was cut off and brought by a band of roughs to the viceroy and the body buried outside the city. But the next day the populace, alarmed by the alteration of the measures for weighing bread, repenting of its insane fury, the body of Masaniello was dug up and given a splendid funeral, at which the viceroy himself was represented.

Masaniello's insurrection appealed to the imagination of poets and composers, and formed the subject of several operas, of which the most famous is Auber's La Mulette de Portici (1828). See Saveno, Insurreccion de Napolii en 1647 (2 vols., Madrid, 1849); A. von Reumont, Die Karifca von Maddaloni (2 vols., Berlin, 1849); P. Ornati, Il segretario della Macedonia (1864); J. V. B. Flagg, "The masari of Naples," in the review Flagg (1900); A. G. Meissner, Masanell in German); E. Bourd, Masaniello (in French); F. Palermo, Documenti diversi sui movimenti accaduti in Napoli l'anno 1647 (in the Archivio storico italiano, 1st series, vol. ix.). See also NAPLES.

MASAYA, the capital of the department of Masaya, Nicaragua, 13 m. W.N.W. of Lake Nicaragua and the city of Granada, on the eastern shore of Lake Masaya, and on the Granada-Managua railway. Pop. (1905), about 20,000. The city is built in the midst of a very fertile lowland region, which yields large quantities of tobacco. The majority of the inhabitants are Indians or half-castes. Among the latter is the isolated volcano of Masaya (3000 ft.) on the opposite side of the lake was active at the time of the conquest of Nicaragua in 1522, and the conquistadors, thinking the lava they saw was gold, had themselves lowered into the crater at the risk of their lives. The volcano was in eruption in 1670, 1782, 1837 and 1902.

MASCAGNI, Pietro (1863--), Italian operatic composer, was born at Leghorn, the son of a baker, and educated for the law; but he neglected his legal studies for music, taking secret lessons at the Instituto Luigi Cherubini. There a symphony by him was performed in 1879, and various other compositions attracted attention, so that money was provided by a wealthy amateur for him to study at the Milan Conservatoire. But Mascagni chafed at the teaching, and soon left Milan to become conductor to a touring operatic company. After a somewhat chequered period he suddenly leapt into fame by the production of his one-act opera Cavalleria Rusticana, containing a tuneful "intermezzo," which became wildly popular. Mascagni was the musical hero of the hour, and Cavalleria Rusticana was performed everywhere. But his later work failed to repeat this success. L'Amico Friti (1891), I Rondine (1894), Guglielmo Ratcliff (1895), Silvano (1893), Zanetto (1896), Iris (1898), Le Maschere (1901), and Amica (1905), were coldly or adversely received; and though Cavalleria Rusticana, with its catchy melodies, still held the stage, this succession of failures involved a steady decline in the composer's reputation. From 1895 to 1903 Mascagni was director of the Pesaro Conservatoire, but in the latter year, having left his post in order to tour through the United States, he was dismissed from the appointment.

MASCARA, chief town of an arrondissement in the department of Oran, Algeria, 60 m. S.E. of Oran. It lies 1800 ft. above the sea, on the southern slope of a range forming part of the Little Atlas Mountains, and occupies two small hills separated by the Wad Tidman, which is crossed by three stone bridges. The walls, upwards of 2 miles in circuit, and strengthened by bastions and towers, give the place a somewhat imposing

http://www.naples.org
appearance. Mascara is a town of the French colonial type, few vestiges of the Moorish period remaining. Among the public buildings are two mosques, in one of which Abd-el-Kader preached the jihad. The town also contains the usual establishments attaching to the seat of a sub-prefect and the centre of a military subdivision. The principal industry is the making of wine, the white wines of Mascara being held in high repute. There is also a considerable trade in grains and oil. A branch railway eight miles long connects Mascara with the seaport of Arzew to Ain Sefra. Access is also gained by this line to Oran, Algiers, &c. Pop. (1906) of the town, 18,089; of the commune, which includes several villages, 22,934; of the arrondissement, comprising eleven communes, 190,154.

Mascara (i.e. "mother of soldiers") was the capital of a Turkish beylik during the Spanish occupation of Oran from the 16th to the close of the 18th century; but for the most of that period it occupied a site about two miles distant from the present position. On the removal of the bey to Oran its importance rapidly declined; and it was an insignificant place when in 1831 Abd-el-Kader, who was born in the neighbourhood, chose it as the seat of his power. It was held in ruins by the French under Marshal Clausel and the duke of Orleans in 1835, the amir retreating south. Being reoccupied by Abd-el-Kader Mascara has since been captured in 1834 by Marshal Bugeaud and General Lamoriciere.

**MASCARENE ISLANDS** (occasionally MASCARENHAS), the collective title of a group of the Indian Ocean east of Madagascar, viz. Mauritius, Réunion and Rodrigues (q.v.). The collective title is derived from the Portuguese navigator Mascarinas, by whom Réunion, at first called Mascarinas, was discovered.

**MASCARON, JULES** (1634-1703), French preacher, was the son of a barrister at Aix. Born at Marseilles in 1634, he early entered the French Oratory, and obtained great reputation as a preacher. Paris confirmed the judgment of the provinces; in 1666 he was asked to preach before the court, and became a great favourite with Louis XIV., who said that his eloquence was one of the few things that never grew old. In 1671 he was appointed bishop of Tulle; eight years later he was transferred to the larger diocese of Agen. He still continued, however, to preach regularly at court, being especially in request for funeral orations. A panegyric on Turenne, delivered in 1675, is considered his masterpiece. His style is strongly tinged with préciosité; and his chief surviving interest is as a glaring example of the evils from which Bossuet delivered the French pulpit. During his later years he devoted himself entirely to his pastoral duties at Agen, where he died in 1703.

Six of his most famous sermons were edited, with a biographical sketch of their author, by the Oratorian Borde in 1700.

**MASCERONI, LORENZO** (1759-1800), Italian geometer, was professor of mathematics at the university of Pavia, and published a variety of mathematical works, the best known of which is his *Geometria del compasso* (Pavia, 1797), a collection of geometrical constructions in which the use of the circle alone is postulated. Many of the solutions are most ingenious, and some of the constructions of considerable practical importance.

There is a French translation by A. M. Carette (Paris, 1798), who also wrote a biography of Maseroni. See Poggendorff, *Biog. Lit. Handwörterbuch*.

**MASCOT** (Fr. slang: perhaps from Port. *mascota*, "witchcraft"), the term for any person, animal, or thing supposed to bring luck. The word was first popularized by Edmond Audran through his comic opera *La Mascotte* (1880), but it had been common in France long before among gamblers. It has been traced back to a dialectic use in Provence and Gascony, where anything which brought luck to a horsehold. The suggestion that it is from *masqué* (masked or concealed), the provincial French for a child born with a caul, in allusion to the lucky destiny of such children, is improbable.

**MASDEU, JUAN FRANCISCO** (1744-1817), Spanish historian, was born at Palermo on the 4th of October 1744. He joined the Company of Jesus on the 10th of December 1750, and became professor in the Jesuit seminaries at Ferrara and Ascoli. He visited Spain in 1790, was exiled, and returned in 1815, dying at Valencia on the 11th of April 1817. *Su Storia critica di Spagna e della cultura spagnuola in ogni genere* (2 vols., 1781-1784) was finally expanded into the *Historia critica de España y de la cultura española* (1783-1805), which, though it consists of twenty volumes, was left unfinished; had it been continued on the same scale, the work would have consisted of fifty volumes. Masdeu wrote in a critical spirit and with a regard for accuracy rare in his time; but he is more concerned with small details than with the philosophy of history. Still, his narrative is lucid, and later researches have not yet rendered his work obsolete.

**MASERU**, the capital of Basutoland, British South Africa. It is pleasantly situated on the left bank of the Caledon river, 90 m. by rail E. by S. of Bloemfontein, and 40 m. N.E. of Wepener. It is in the centre of a fertile grain-growing district. Pop. (1904), 862, of whom 99 were Europeans. The principal buildings are Government House, the church of the Paris Evangelical Missionary Society, the hospital, and the railway station. (See BASUTOLAND.)

**MASHAM, ABIGAIL**, Lady (d. 1734), favourite of Anne, queen of England, was the daughter of Francis Hill, a London merchant, her mother being an aunt of Sarah Jennings, duchess of Marlborough. The family being reduced to poor circumstances through Hill's speculations, Lady Churchill (as she then was), lady of the bedchamber to the Princess Anne, befriended her cousin Abigail, whom she took into her own household at St Albans, and for whom after the accession of the princess to the throne she procured an appointment in the queen's household about the year 1704. It was not long before Abigail Hill began to supplicate her powerful and imperious kinswoman in the favour of Queen Anne. Whether she was guilty of the deliberate ingratitude charged against her by the duchess of Marlborough is uncertain. It is not unlikely that, in the first instance at all events, Abigail's influence over the queen was not so much due to subtle scheming on her part as to the pleasing contrast between her gentle and genial character and the dictatorial temper of the duchess, which after many years of undisputed sway had at last become intolerable to Anne. The first intimacy of her protégée's growing favour with the queen came to the duchess in the summer of 1707, when she learned that Abigail Hill had been privately married to a gentleman of the queen's household named Samuel Masham, and that the queen herself had been present at the marriage. Inquiry then elicited the information that Abigail had for some time enjoyed considerable intimacy with her royal mistress, no hint of which had previously reached the duchess. Abigail was said to be a cousin of Robert Harley, earl of Oxford, and after the latter's dismissal from office in February 1708 she assisted him in maintaining confidential relations with the queen. The completeness of her ascendency was seen in 1710 when the queen compelled Marlborough, much against his will, to give an important command to Colonel John Hill, Abigail's brother; and when Sunderland, Godolphin, and the other Whig ministers were dismissed from office, largely owing to her influence, to make way for Oxford and Bolingbroke. In the following year the duchess of Marlborough was also dismissed from her appointment at court, Mrs Masham taking her place as keeper of the privy purse. In 1711 the ministers, intent on bringing about the disgrace of Marlborough and arranging the Peace of Utrecht, found it necessary to secure their position in the House of Lords by creating twelve new peers; one of these was Samuel Masham, the favourite's husband, though Anne showed some reluctance to raise her bedchamber woman to a position in which she might show herself less ready to give her personal services to the queen. Lady Masham soon quarrelled with Oxford, and set herself to foster by all the means in her power the interests of her protegée, thus giving personal distaste for her minister. Oxford's vacillation between the Jacobites and the adherents of the Hanoverian succession to the Crown probably strengthened the opposition of Lady Masham, who now warmly favoured the Jacobite party led by Bolingbroke and Atterbury. Altercations took place in the queen's presence between Lady Masham and the minister; and finally, on the 27th of July 1714, Anne dismissed Oxford from his office of lord high treasurer, and three days later gave the staff to the duke of Shrewsbury. Anne died
on the 1st of August, and Lady Masham then retired into private life. She died on the 6th of December 1734.

Lady Masham was by no means the vulgar, ill-educated person she was represented to have been by her defeated rival, the duchess of Marlborough; her extant letters, showing not a little refinement of literary style, prove the reverse. Swift, with whom both she and her husband were intimate, describes Lady Masham as "a person of a plain sound understanding, of great truth and sincerity, without the least mixture of falsehood or disguise." The barony of Masham became extinct when Lady Masham's son, Samuel, the 2nd baron, died in June 1776.

MASHAM, SAMUEL CULLIFEE LISTER, 1st BARON (1815–1906), English inventor, born at Calverley Hall, near Bradford, on the 1st of January 1815, was the fourth son of Ellis Cullifee Lister (1774–1853), who, successively took the names of Lister and Lister-Kay, and was the first member of parliament elected for Bradford after the Reform Act of 1832. He was at first proposed that he should take orders, but he preferred a business career and became a clerk at Liverpool. In 1838 he and his elder brother John started as worsted spinners and manufacturers in a new mill which their father built for them at Manningham, and about five years later he turned his attention to the problem of mechanical wool-combing, which, in spite of the efforts of E. Cartwright and numerous other inventors, still awaited a satisfactory solution. Two years of hard work spent in modifying and improving existing devices enabled him to produce a machine which worked well, and subsequently he consolidated his position by buying up rival patents, as well as by taking out additional ones of his own. His combing machines came into such demand that though they were made for only £200 apiece he was able to sell them for £1200, and the saving they effected in the cost of production not only brought about a reduction in the price of clothing, but in consequence of the increase in the sales created the necessity for new supplies of wool, and thus contributed to the development of Australian sheep-farming. In 1855 he was sent a sample of silk waste (the refuse left in reeling silk from the cocoons) and asked whether he could find a way of utilising the fibre it contained. The task occupied him for many years and brought him to the verge of bankruptcy, but at last he succeeded in perfecting silk-combing appliances which enabled him to make yarn that in one year sold for 2s. a pound, though produced from raw material costing £20 a pound. This invention in connexion with silk manufacture was his velvet loom for piled fabrics; and this, with the silk comb worked at his Manningham mill, yielded him an annual income of £5000 for many years. But the business was seriously affected by the prohibitory duties imposed by America, and this was one reason why he was an early and determined critic of the British policy of free imports. In 1891 he was made a peer; he took his title from the little Yorkshire town of Masham, close to which is Swinton Park, purchased by him in 1888. In 1886 an Albert medal was awarded him for his inventions, which were mostly related to the textile industries, though he occasionally diverged to other subjects, such as an air-brake for railways. He was fond of outdoor sports, especially coursing and shooting, and was a keen patron of the fine arts. He died at Swinton Park on the 2nd of February 1906, and was succeeded in the title by his son.

MASHONA, a Bantu negro people, inhabitants of Mashonaland, Southern Rhodesia. The name Mashona has been derived from the contemptuous term Amashuna applied by the Matabele to the aborigines owing to the habit of the latter of taking refuge in the rocky hills with which the country abounds. Before the Matabele invasion about 1840 most of Southern Rhodesia was occupied by the Makalanga, the Makorikori and the Banyai, all closely related. Most of them became subject to the Matabele, but although they suffered severely from their attacks, the Mashona preserved a certain national unity. In 1890 the Mashona came under British protection (see RHODESIA). They are in general a peaceful, mild-mannered people, industrious and successful farmers, skilful potters, and weavers of bark cloth.

The crafts, however, in which they excel are the smelting and forging of iron and wood-carving. They are also great hunters; and they are very fond of music, the most usual instrument being the "piano" with iron keys. Bows and arrows, assegais and axes are the native weapons, but all who can get them now use guns. Up to their conquest by the Matabele the Mashona worked the gold diggings which are scattered over their country; indeed, some of their women were still extracting gold from quartz (Geog. Jour. April 1906).

For the possible connexion of these people with the builders of the ruins at Zimbabwe and elsewhere, see Rhodesia: Archaeology; and ZIMBABWE.

MASK (Fr. masque, apparently from med. Lat. mascus, masca, spectre, through Ital. maschera, Span. mascara), a covering for the face, taking various forms, used either as a protective screen or as a disguise. In the latter sense masks are mostly associated with the artificial faces worn by actors in dramatic representations, or assumed for exciting terror (e.g. in savage rites). The spelling "masque," representing the same word, is now in English used more specially for certain varieties of drama in which masks were originally worn (see DRAMA); so also masquerade," particularly in the sense of a masked ball or an entertainment where the personages are disguised. Both "mask" and "masquerade" have naturally passed into figurative and technical meanings, the former especially for various senses of face and head (head of a fox, grotesque faces in sculpture), or as equivalent to "cloak" or "screen" (as in fortification or other military uses, fencing, &c.). And in the case of "death-masks" the term is employed for the portrait-casts, generally of plaster or metallic foil, taken from the face of a dead person (also similarly from the living), an ancient practice of considerable interest in art. An interesting collection made by Laurence Hutton (see his Portraits in Plaster, 1894), is at Princeton University in the United States. For the historical mystery of "the man in the iron mask," see Iron Mask.

The ancient Greek and Roman masks worn by their actors—hollow figures of heads—had the double object of identifying the performers with the characters assumed, and of increasing the power of the voice by means of metallic mouthpieces. They were derived like the drama from the rural religious festivities, the wearing of mock faces or beards being a primitive custom, connected no doubt with many early types of folklore and religious. The use of the dramatic mask was evolved in the later theatre through the mimes and the Italian popular comedy into pantomime; and the masquerade similarly came from Italy, where the domino was introduced from Venice. The domino (originally apparently an ecclesiastical garment) was a loose cloak with a small half-mask worn at masquerades and costume-balls by persons not otherwise dressed in character; and the word is applied also to the person wearing it.

See generally Altmann, Die Masken der Schauspieler (1875; new ed., 1896); and Dale, Masks, Labrets and Certain Aboriginal Customs (1858); also Drama.

MASKELYNE, NEVIL (1732–1811), English astronomer-royal, was born in London on the 6th of October 1732. The
solary eclipse of 1748 made a deep impression upon him; and having graduated as seventh wrangler from Trinity College, Cambridge in 1731, he determined to devote himself wholly to astronomy. He became intimate with James Bradley in 1755, and in 1761 was deputed by the Royal Society to make observations of the transit of Venus at St Helena. During the voyage he experimented upon the determination of longitude by lunar distances, and ultimately effected the introduction of the method into navigation (q.v.). In 1765 he succeeded Nathaniel Bliss as astronomer-royal. Having energetically discharged the duties of his office during forty-six years, he died on the 9th of February 1811.

Maskelyne's first contribution to astronomical literature was "A Proposal for Discovering the Annual Parallax of Sirius," published in 1760 (Phil. Trans. li. 889). Subsequent volumes of the same series contained his observations of the transits of Venus (1761 and 1769), on the tides at St Helena (1762), and on various astronomical phenomena at St Helena (1764) and Barbadoes (1764). In 1763 he published the British Mariner's Guide, which includes the suggestion that in order to facilitate the finding of longitude at sea, lunar distances should be calculated beforehand for each month and published in a form accessible to navigators. This important proposal, the germ of the Nautical Almanac, was approved by the government, and under the care of Maskelyne the Nautical Almanac for 1767 was published in 1766. He continued during the remainder of his life the Almanac and published a revised edition yearly. He further induced the government to print his observations annually, thereby securing the prompt dissemination of a large mass of data inestimable from their continuity and accuracy. Maskelyne's Account of the Assisted Navy, an Assistant, was perfectly organized and methodically executed. He introduced several practical improvements, such as the measurement of time to tenths of a second; and he prevailed upon the government to publish Bird's Almanack and voyages, and to cause the Almanack to be printed with a circle 6 ft. in diameter. The new instrument was constructed by E. Troughton; but Maskelyne did not live to see it completed. In 1772 he suggested to the Royal Society the famous Scheelh's experiment of the extinction of the earth's density and carried out his plan in 1774 (Phil. Trans. l. 495), the apparent difference of latitude between two stations on opposite sides of the mountain being compared with the real difference of latitude obtained by triangulation. From Maskelyne's observations Charles Hutton deduced a density for the earth 4.5 times that of water (ib. lxiii. 782). Maskelyne also took a great interest in various geodetic operations, notably the measurement of the length of a degree of latitude in Maryland and Pennsylvania (ib. lviii. 323), executed by Mason and Dixon in 1766-1768, and the determination of the relative longitude of Greenwich and Paris (ib. lxxv. 151). On the French side the work was conducted by Count Cassini, Legendre, and others; on the English side by General Roy. This triangulation was the beginning of the British trigonometrical survey which has since been extended all over the country. His observations appeared in four large folio volumes (1776-1811). Some of them were reprinted in S. Vince's Astronomy (vol. iii.). (A. M. C.)

MASOLINO DA PANICALE (1383-1.) Florentine painter, was said to have been born at Panciale di Valdelsa, near Florence. It is more probable, however, that he was born in Florence itself, his father, Cristoforo Fini, who was an "imbiancatore," or whitewasher, having been domiciled in the Florentine quarter of S. Croce. There is reason to believe that Tommaso, nicknamed Masolino, was a pupil of the painter Starnina, and was principally influenced in style by Antonio Veneziano; he may probably enough have become in the sequel the master of Masaccio. He was born in 1383; he died later than 1439, perhaps as late as 1440 or even 1447. Towards 1423 he entered the service of Filippo Scolari, the Florentine-born oberstaupt of Temeswar in Hungary, and stayed some time in that country, returning towards 1427 to Italy. The only works which can be confidently assigned to him are a series of wall-paintings executed towards 1427 for Cardinal Branda Castiglione, in the church of Castiglione d'Olonia, not far from Milan, and another series in the adjoining baptistery. The first set is signed as painted by "Masolino de Florentia." It was recovered in 1843 from a coating of whitewash, considerably damaged; its subject matter is taken from the lives of the Virgin and of SS Lawrence and Stephen. The series in the baptistery relates to the life and death of John the Baptist. The reputation of Masolino had previously rested almost entirely upon the considerable share which he was supposed to have had in the celebrated frescoes of the Castiglione Chapel, in the Church of the Carmine in Florence; he was regarded as the precursor of Filippino Lippi, in the execution of a large proportion of these works. But a comparison of the Castiglione with the Brancacci frescoes, and from other data, it is very doubtful whether Masolino had any hand at all in the latter series. Possibly he painted in the Brancacci Chapel certain specified subjects which are now either destroyed or worked over. Several paintings assigned to Masolino on the authority of Vasari are now ascribed to Masaccio. (W. M. R.)

MASON, FRANCIS (1700-1874), American missionary, was born in York, England, on the 2nd of April 1799. His grandfather, Francis Mason, was the founder of the Baptist Society in York, and his father, a shoemaker by trade, was a Baptist lay preacher there. After working with his father as a shoemaker for several years, he emigrated in 1815 to the United States, and in Massachusetts was licensed to preach as a Baptist in 1827. In 1830 he was sent by the American Baptist Missionary Convention to labour among the Karens in Burma. Besides conducting a training college for native preachers and teachers in Burma, he translated the Bible into two principal dialects of the Karens and in 1853 (his translation being published in 1853), and Matthew, General Lips, into the Bghai dialect. He also published A Pali Grammar on the Basis of Kachchayano, with Christomathy and Vocabulary (1868). In 1852 he published a book of great value on the fauna and flora of British Burma, of which an improved edition appeared in 1860 under the title Burmah, its People and Natural Productions, and a third edition (2 vols.) revised and enlarged by W. Theobald in 1882-1883. He died at Rangoon on the 3rd of March 1874.

See his autobiography, The Story of a Working Man's Life, with Sketches of Travel in Europe, Asia, Africa and America (New York, 1870).

MASON, GEORGE (1725-1792), American statesman, was born in Stafford county (the part which is now Fairfax county), Virginia, in 1725. His family was of Royalist descent and emigrated to America after the execution of Charles I. His colonial ancestors held official positions in the civil and military service of Virginia. Mason was a near neighbour and a lifelong friend of George Washington, though in later years they disagreed in politics. His large estates and high social standing, together with his personal ability, gave Mason great influence among the Virginia planters, and he became identified with the intermittent organization of the Ohio Company and the founding of Alexandria, 1749. He was a member of the Virginia House of Burgesses in 1759-1760. In 1760 he drew up for Washington a series of non-importation resolutions, which were adopted by the Virginia legislature. In July 1774 he wrote for a convention in Fairfax county a series of resolutions known as the Fairfax Resolves, in which he advocated a congress of the colonies and suggested non-intercourse with Great Britain, a policy subsequently adopted by Virginia and later by the Continental Congress. He was a member of the Virginia Committee of Safety from August to December 1775, and of the Virginia Convention in 1775 and 1776; and in 1776 he drew up the Virginia Constitution and the famous Bill of Rights, a radically democratic document which had great influence on American political institutions. In 1780 he outlined the plan which was subsequently adopted by Virginia for ceding to the Federal government her claim to the "back lands," i.e. territory north and north-west of the Ohio river. From 1776 to 1788 he represented Fairfax county in the Virginia Assembly. He was a commissioner of the Governor's House of Delegates in 1776 and again in 1787-1788, and in 1787 was a member of the convention that framed the Federal Constitution, and as one of its ablest debaters took an active part in the work. Particularly notable was his opposition to the compromises in regard to slavery and the slave-trade. Indeed, like most of the prominent Virginians of the time, Mason was strongly in favour of the gradual abolition of slavery. He objected to the large and indefinite powers given by the completed Constitution to
Congress, so he joined with Patrick Henry in opposing its ratification in the Virginia Convention (1788). Failing in the hope suggested amendments, the substance of several foils and which was afterwards embodied in the present Bill of Rights. Declining an appointment as a United States Senator from Virginia, he retired to his home, Gunston Hall (built by him about 1738 and named after the family home in Staffordshire, England), where he died on the 7th of October 1792. With James Madison and Thomas Jefferson, Mason carried through the Virginia legislature measures disestablishing the Episcopal Church and protecting all forms of worship. In politics he was a radical republican, who believed that local government should be kept strong and central government weak; his democratic theories had much influence in Virginia and other southern and western states.

See Kate Mason Rowland, Life and Writings of George Mason (2 vols., New York, 1892).

MASON, GEORGE HEMMING (1818–1872), English painter, was born at Wetley Abbey, the eldest son of a Staffordshire county gentleman. He was educated at King Edward's School, Birmingham, and studied for the rectorate for five years under Dr Watt of that city. But all his thoughts being given to art, he abandoned medicine in 1844 and travelled for a time on the Continent, finally settling in Rome, where he remained for some years and sought to make a living as an artist. During this period he underwent many privations which permanently affected his health; but he continued to labour assiduously, making studies of the picturesque scenery that surrounded him, and with hardly any instruction except that received from Nature and from the Italian pictures he gradually acquired the painter's skill. At least two important works are referable to this period: “Ploughing in the Campagna,” shown in the Royal Academy of 1857, and “In the Salt Marshes, Campagna,” exhibited in the following year. After Mason's return from the continent, in 1858, when he settled at Wetley Abbey, he continued for a while to paint Italian subjects from studies made during his stay abroad, and then his art began to touch in a wonderfully tender and poetic way the pleasant life of England, especially of his native Staffordshire, and the homely landscape in the midst of which that life was set. The first picture of this class was “Wind on the Wold,” and it was followed—along with much else of admirable quality—by the painter's three greatest works: The “Evening Hymn” (1868), a band of Staffordshire mill-girls returning from their work; “Girls dancing by the Sea” (1869); and the “Harvest Moon” (1872). He left Staffordshire in 1865 and went to live at Hammersmith; and he was elected an associate of the Royal Academy in 1869. By that time he had fully established his position as an artist of unequal power and individuality. Mason died on the 22nd of October 1872. In his work he laboured under the double disadvantage of feeble and uncertain health, and a want of thorough art-training, so that his pictures were never produced easily, or without strenuous and long-continued effort. His art is great in virtue of the solemn pathos which pervades it, of its dignity and beauty in rustic life which it represents, of its keen common sense and graceful motion, and of rich effects of colour and subdued light. In motif and treatment it has something in common with the art of Millet and Jules Breton, as with that of Frederic Walker among Englishmen; though he had neither the occasional uncouth robustness of Millet nor the firm actuality of Jules Breton. His pictures “Wind on the Wold” and “The Cast Shoe” are in the National Gallery of British Art.

MASON, JAMES MURRAY (1708–1781), American political leader, was born in Fairfax county, Virginia, on the 3rd of November 1708, the grandson of George Mason (1725–1792). Educated at the university of Pennsylvania and the college of William and Mary, he was admitted to the bar in 1726. He was a member of the Virginia House of Delegates in 1726–1727 and 1728–1731, of the state constitutional Convention of 1789, of the National House of Representatives (1837–1839), of the United States Senate from 1847 until July 1851 (when, with other southern senators he was formally expelled—he had previously withdrawn), and of the Virginia Secession Convention in April 1861. Entering politics as a Jacksonian Democrat, Mason was throughout his career a consistent strict constructionist, opposing protective tariffs, internal improvements by the national government, and all attempts to restrict or control the spread of slavery, which he sincerely believed to be essential to the social and political welfare of the South. He was the author of the Fugitive Slave Act of 1850, and in 1860 was chairman of the Senate committee which investigated the John Brown raid. After Lincoln's election as President he was one of the strongest advocates of secession in Virginia. He was appointed in August 1861 commissioner of the Confederate States to Great Britain. The British ship “Trent,” upon which he and John Slidell, the commissioner to France, sailed, was intercepted (Nov. 8, 1861) by a United States ship-of-war (the “San Jacinto,” Captain Charles Wilkes), and the two commissioners were seized and carried as prisoners to Boston. Great Britain immediately demanded their release, and war for a time seemed imminent; but owing mainly to the tactful action of the prince consort, Lincoln was persuaded that the seizure of Mason and Slidell was a violation of the rights of Great Britain as a neutral, and on the 1st of January 1862 released the commissioners. The incident has become known in history as the “Trent Affair.” Mason at once proceeded to London, where, however, he was unable to secure official recognition, and his commission to Great Britain was withdrawn late in 1863. He remained in Europe, spending most of his time at Paris and holding blank commissions which he was authorized to fill in at his discretion in case the presence of a Confederate commissioner should seem desirable at any particular European court. These commissions, however, he did not use. After the war he lived for several years in Canada, but returned in 1869 to Virginia, and on the 28th of April 1871 died at Alexandria.

See The Public Life and Diplomatic Correspondence of James M. Mason, with some Personal History (Roanoke, Va., 1905). by his daughter, Virginia Mason; Sir Theodore Martin, Life of the Prince Consort.

MASON, SIR JOHN (1501–1566), English diplomatist, was born of humble parentage at Abingdon in 1503, and was educated at Oxford, where he became Fellow of All Souls in 1521. He was ordained before 1531. Most of his early years were spent on the Continent, where he witnessed the meeting between Henry VIII. and Francis I. at Calais in 1532, and where he was employed in collecting information for the English government, gaining in this work the reputation of a capable diplomatist. By his ever-failing caution, moderation and piety, Mason succeeded in keeping himself in favour with four successive sovereigns of the Tudor monarchy. In 1537 he became secretary to the English ambassador at Madrid, Sir Thomas Wyatt; but when the latter was put on his trial for treason in 1541 Mason was un molested, and soon afterwards was appointed clerk of the privy council, and procured for himself sundry other posts and privileges. Mason was knighted and made dean of Winchester. He was one of the commissioners to negotiate the treaty by which Boulogne was restored to France in 1550, and in the same year he became English ambassador in Paris, where he helped to arrange the betrothal of Edward VI. to the princess Elizabeth of France. He returned to England at the end of 1551, became clerk of parliament, received extensive grants of land, and in 1552 was made chancellor of Oxford University. He was elected member of parliament in the same year. On the death of Edward VI., he at first joined the party of Northumberland and the Lady Jane Grey; but quickly perceiving his mistake he took an active part in procuring the proclamation of Mary as queen. Mason now received fresh tokens of royal favour, being confirmed in all his secular, though not in his ecclesiastical, offices; and in 1553 he was appointed English ambassador at the court of the emperor Charles V., of whose abdication at Brussels in October 1555 he wrote a vivid account. He took a prominent share in the
administrative business of the government in the first years of Elizabeth's reign, and largely influenced her foreign policy until his death, which occurred on the 20th of April 1646. Sir John Mason married Elizabeth, daughter of Sir Thomas Isley of Sundraige, Kent, and widow of Richard Hill. He had no children, and his heir was Anthony Wyckes, whom he had adopted, and who assumed the name of Mason and left a large family.

MASON, JOHN (1586–1653), founder of New Hampshire, U.S.A., was born in King's Lynn, Norfolk, England. In 1610 he commanded a small naval force sent by James I. to assist in subduing the Hebrides Islands. From 1615 to 1621 he was governor of the English colony on the north side of Conception Bay in Newfoundland; he explored the island, made the first English map of it (published in 1625), and wrote a descriptive tract entitled A Briefe Discourse of the Newfound-land (Edinburgh, 1620) to promote the colonization of the island by Scotsmen. Here he was brought into official relations with Sir Ferdinando Gorges, then a commissioner to regulate the Newfoundland fisheries. In March 1622 Mason obtained from the Council for New England, of which Gorges was the most influential member, a grant of a territory (which he named Mariana) between the Naumkeag or Salem river and the Merrimac, and in the following August he and Gorges together received a grant of the region between the Merrimac and Kennebec rivers, and extending 60 m. inland. From 1625 to 1629 Mason was engaged as treasurer and paymaster of the English army in the wars which England was waging against Spain in France. Towards the close of 1629 Mason and Gorges agreed upon a division of the territory held jointly by them, and on the 7th of November 1629 Mason received from the Council a separate grant of the tract between the Merrimac and the Pisquetica, which he now named New Hampshire. Thinking that the Pisquetica river had its source in Lake Champlain, Mason with Gorges and a few other associates secured, on the 17th of November 1629, a grant of a region which was named Laconia (apparently from the number of lakes it was supposed to contain), and was described as bordering on Lake Champlain, extending 10 m. east and south from it and far to the west and north-west, together with 1000 acres to be located along some convenient harbour, presumably near the mouth of the Pisquetica. In November 1631 Mason and his associates obtained, under the name of the Pescataway Grant, a tract on both sides of the Pisquetica river, extending 30 m. inland and including also the Isles of Shoals, a grant which a member of the Court of New England in June 1632, and its vice-president in the following November; and in 1635, when the members decided to divide their territory among themselves and surrender their charter, he was allotted as his share all the region between the Naumkeag and Pisquetica rivers extending 60 m. inland, the southern half of the Isles of Shoals, and a ten-thousand acre tract, called Masonia, on the west side of the Kennebec river. In October 1635 he was appointed vice-admiral of New England, but he died early in December, before crossing the Atlantic. He was buried in Westminster Abbey. Forty-four years after his death New Hampshire was made a royal province.

See Captain John Mason, the Founder of New Hampshire (Boston, 1887; published by the Prince Society), which contains a memoir by E. W. Tuttle and historical papers relating to Mason's career, edited by E. W. Dushaw.

MASON, JOHN YOUNG (1799–1859), American political leader and diplomatist, was born in Greene county, Virginia, on the 18th of April 1809. Graduating at the university of North Carolina in 1816, he studied law in the famous Litchfield (Connecticut) law school, and in 1819 was admitted to practice in Southampton county, Virginia. He served in the Virginia house of delegates in 1823, and, in the state constitutional convention of 1829–1830, and from 1831 to 1837 in the National House of Representatives, being chairman of the committee on foreign affairs in 1835–1836. He was secretary of the navy in President Tyler's cabinet (1844–1845), and was attorney-general (1845–1846) and secretary of the navy (1846–1849), succeeding George Bancroft, under President Polk. He was president of the Virginia constitutional convention of 1851, and from 1853 until his death at Paris on the 3rd of October 1859, was United States minister to France. In this capacity he attracted attention by wearing at the court of Napoleon III. a simple diplomatic uniform (for this he was rebuked by Secretary of State W. L. Marcy, who had ordered American ministers to wear a plain civilian costume), and by joining with James Buchanan and Pierre Soule, ministers to Great Britain and Spain respectively, in drawing up (Oct. 1854) the famous Ostend Manifesto. Hawthorne called him a "fat-brained, good-hearted, sensible old man", and in politics he was a typical Virginian of the old school, a state's rights Democrat, upholding slavery and hating abolitionism.

MASON, SIR JOSIAH (1795–1881), English pen-manufacturer, was born in Kidderminster on the 23rd of February 1795, the son of a carpet-weaver. He began life as a street hawker of cakes, fruits and vegetables. After trying his hand in his native town at shoemaking, baking, carpentering, blacksmithing, house-painting and carpet-weaving, he moved in 1814 to Birmingham. Here he found employment in the gilt-toy trade. In 1824 he set up on his own account as a manufacturer of split-rings by machinery, to which he subsequently added the making of steel pens. Owing to the circumstance of his pens being supplied through James Perry, the London stationer whose name they bore, he was less well known than Joseph Gillott and other makers, although he was really the largest producer in England. In 1874 the business was converted into a limited liability company. Besides his steel-plate Mason carried on for many years the business of electro-plating, copper-smelting, and India-rubber ring making, in conjunction with George R. Ellington. Mason was almost entirely self-educated, having taught himself to write when a shoemaker's apprentice, and in later life he felt his deficiencies keenly. It was this which led him in 1860 to establish his great orphanage at Erdington, near Birmingham. Upon it he expended about £300,000, and for this munificent endowment he was knighted in 1872. He had previously given a dispensary to his native town and an almshouse to Erdington. In 1880 Mason College, since incorporated in the university of Birmingham, was opened, the total value of the endowment being about £250,000. Mason died on the 16th of June 1881.

See J. T. Bunce, Josiah Mason (1882).

MASON, LOWELL (1792–1872), American musician, was born at Medfield, Massachusetts. For some years he led a business life, but was always studying music; and in 1827, as the result of his work in forming the collection of church music published in 1821 at Boston by the Handel and Haydn Society, he moved to Boston and there first became president of the society and then founder of the Boston Academy of Music (1832). He published some successful educational books, and was a pioneer of musical instruction in the public schools, adopted in 1838. He received the degree of doctor of music from New York University in 1855. He died at Orange, New Jersey, on the 11th of August 1872.

His son William Mason (1829–1908), an accomplished pianist and composer, published an interesting volume of reminiscences, Memoirs of a Musical Life, in 1901.

MASON, WILLIAM (1725–1797), English poet, son of William Mason, vicar of Holy Trinity, Hull, was born on the 12th of February 1725, was educated at St. John's College, Cambridge, and took holy orders. In 1744 he wrote Museus, a lament for Pope in imitation of Lycidas, and in 1749 through the
influence of Thomas Gray he was elected a fellow of Pembroke College. He became a devoted friend and admirer of Gray, who addressed him as Skroddle, and corrected the worst spellings in his version. In 1748 he published a poem directed against the supposed Jacobitism of the university of Oxford, which provoked Thomas Warton's 'Triumph of Isis.' Mason conceived the ambition of reconciling modern drama with ancient forms by strict observance of the unities and the restoration of the chorus. These ideas were exemplified in Elfrida (1752) and Caractacus (1759), two frigid performances no doubt intended to be read rather than acted, but produced with some alterations at Covent Garden in 1772 and 1776 respectively. Horace Walpole described Caractacus as "laboured, uninteresting, and no more resembling the manners of Britons than of Japanese"; while Gray declared he had read the manuscript "not with pleasure only, but with emotion." In 1754 Mason was presented to the rectory of Aston, near Rotherham, Yorkshire, and in 1757 through the influence of the duke of Devonshire he became one of the king's chaplains. He also received the prebend of Holme in York Minster (1759), was made canon residuary in 1763, and in 1763 became precentor and prebendary of Driffield. He married in 1764 Mary Sherman, who died three years later. When Gray died in 1771 he made Mason his literary executor. In the preparation of the Life and Letters of Gray, which appeared in 1774, he had much to do. Mason, a 'people's gray', with whom he was connected regularly until 1778 when Mason opposed Fox's India Bill, and offended Walpole by thrashing on him political advice unasked. Twelve years of silence followed, but in the year before his death the correspondence was renewed on friendly terms. Mason died at Aston on the 7th of April 1797.

His correspondence with Gray and Walpole shows him to have been a man of cultivated tastes. He was something of an antiquarian, a good musician, and an amateur of painting. He is said to have invented an instrument called the celestina, a modified pianoforte. Gray rewarded his faithful admiration with good-humoured kindness. He warned him against confounding Mona with the Isle of Man, or the Goths with the Celts, corrected his grammar, pointed out his plagiarisms, and laughed gently at his superficial learning. His power and breadth of mind were also to advantage in the unacknowledged satirical poems which he produced under the pseudonym of Malcolm Macgregor. In editing Gray's letters he took considerable liberties with his originals, and did not print all that he received from him.

Mason's other works included Odes (1758); The English Garden, a didactic poem in blank verse, the four books of which appeared in 1772, 1777, 1779 and 1782; An Heroic Epistle to Sir William Chambers (1744); an Ode on the Duke of Northumberland (1776) and an Essay on Dr Shebbeare's Essay on Music, the latter by "Malcolm of the Morays, Esq." History and Critical, of Church Music (1795), and a lyrical drama, Sappho (1797).

His poems were collected in 1764 and 1774, and an edition of his Works appeared in 1811. His poems with a Life are included in Alexander Chalmers's English Poets. His correspondence with Walpole was edited by J. Mitford in 1851; and his correspondence with Gray by the same editor in 1853. See also the standard editions of the letters of Gray and of Walpole. There is a very pleasant picture of Mason's character in Southey's Doctor (ch. cxxvi).

MASON AND DIXON LINE, in America, the boundary line (lat. 39° 43' 26 73" N.) between Maryland and Pennsylvania, U.S.A.; popularly the line separating "free" states and "slave" states before the Civil War. The line derives its name from Charles Mason (1730-1787) and Jeremiah Dixon, two English astronomers, whose survey of it to a point about 244 m. west of the Delaware between 1763 and 1767 marked the close of the protracted boundary dispute (arising upon the grant of Pennsylvania to William Penn in 1681) between the Baltimoreans and Penns, proprietors respectively of Maryland and Pennsylvania. The dispute arose from the designation, in the grant to Penn, of the southern boundary of Pennsylvania mainly as the parallel marking the "beginning of the fortieth degree of Northerm Latitude," after the northern boundary of Maryland had been defined as a line "which lieth under the fortieth degree of north latitude from the equinocial." The eastern part of the line as far as Sideling Hill in the western part of the present Washington county, was originally marked with milestones brought from England, every fifth of which bore on one side the arms of Baltimore and on the opposite side those of Philadelphia, but the positions of the milestones were so great that many of them were not set up. Owing to the removal of the stone marking the north-east coast of Maryland, this point was again determined and marked in 1849-1850 by Lieut.-Colonel J. D. Graham of the U.S. topographical engineers; and as the western part of the boundary was not marked by stones, and local disputes arose, the line was again surveyed between 1901 and 1903 under the direction of a commission appointed by Pennsylvania and Maryland.

The use of the term "Mason and Dixon Line" to designate the boundary between the free and the slave states (and in general between the North and the South) dates from the debates over the Compromise in Congress over the Missouri Compromise in 1819-1820. As so used it may be defined as not only the Mason and Dixon Line proper, but also the line formed by the Ohio River from its intersection with the Pennsylvania boundary to its mouth, thence the eastern, northern and southern boundaries of Maryland, and thence westward the 36° 30"—the line established by the Missouri Compromise to separate free and slave territory in the "Louisiana Purchase," except as regards Missouri. It is to be noted, however, that the 1850 Missouri Compromise did not affect the territory later acquired from Mexico.

MASON CITY, a city and the county-seat of Cerro Gordo county, Iowa, U.S.A., on Lime Creek, in the northern part of the state. Pop. (1905, state census), 8,537 (929 foreign-born); (1910) 11,230. It is served by the Chicago Milwaukee & St. Paul, the Chicago & North-Western, the Chicago Great Western, the Iowa Central and the St Paul & Des Moines railways, and also by the Mason City & Clear Lake (electric) railway, which connects Mason City with Clear Lake, a pleasure resort, 10 m. west of the city. At Mason City is Memorial University (co-educational; founded in 1900 by the National Encampment of the Sons of Veterans, and opened in 1902), dedicated to the Grand Army of the Republic, the special aim of which is to teach American history. The city is situated in a good agricultural region, and there are valuable stone quarries in the vicinity. The manufactures include lime, Portland cement, brick and tile. Mason City was settled in 1853, laid out in 1855, incorporated as a town in 1870 and chartered as a city in 1882.

MASONRY, the art of building in stone. The earliest remains (apart from the primitive work in rude stone—see STONE MONUMENTS; ARCHEOLOGY, &c.) are those of the ancient temples of India and Egypt. Many of these early works were constructed of stone quarried near them, and it is still a mystery how the ancients were able to quarry and raise to a considerable height above the ground blocks seven or eight hundred tons in weight. Many of the early buildings of the middle ages were entirely constructed of masses of concrete, often faced with a species of rough cast. The early masonry seems to have been for the most part worked with the axe and not with the chisel. A very excellent example of the contrast between the earlier and later Norman masonry may be seen in the choir of Canterbury Cathedral. In those times the groining was frequently filled in with a light tufa stone, said by some to have been brought from Italy, but more probably from the Rhine. The Normans imported a great quantity of stone from Caen, it being easily worked, and particularly fit for carving. The freestones of England were also much used; and in the first pointed period, Purbeck and Betersden marbles were employed for column shafts, &c. The methods of working and setting stone were much the same as at present, except that owing to difficulties of conveyance the 1

1 The English word "mason" is from the French, which appears in the Latin form masonem, from magister, the last comes the modern Fr. form mason, which means indifferently a bricklayer or mason. In O. H. Ger. the word is mezzo, which survives in the German for a stone-mason, Steinmetz. The med. Lat. form, machin, was connected with machina—obviously a guess. The Low Lat., machinor, or maceria (see Du Cange, Glossarium, i, macti), a wall, has been suggested as showing some connexion. Some popular Lat. form as macio or matto is probably the origin. No Teut. word, according to the New English Dictionary, except that which appears in "mattock," seems to have any bearing on the ultimate origin.

2 These surveys also surveyed and marked the boundary between Maryland and Delaware.
MASONRY

stones were used in much smaller sizes. As time went on the art of masonry advanced till in England, in point of execution, it at length rivaled that of any country.

Tools.—The mason’s tools may be grouped under five heads—hammer, chisel, saws, chisels, setting-out and setting tools, and hoisting appliances.

There are several different kinds of iron hammers used by the stone worker; the mash hammer has a short handle and heavy head for use with chisels; for the cutter, in carving, is a carpenter’s mallet but is smaller; the waller’s hammer is used for roughly shaping stones in rubble work; the spalling hammer for roughly dressing stones in the quarry; the scabbling-hammer, for the same purpose, has one end pointed for use on hard stone; the pick has a long head pointed at both ends, weighs from 14 to 20 lb, and is used for rough dressing and splitting; the axe has a double wedge-shaped head and is used to bring stones to a fairly level face preparatory to their being worked smaller to the pattern in use; the sledge hammer has a plate with a number of plates with sharpened edges bolted together to form a head; the mallet of hard wood is used for the finishing chisel work and carving; and the dummys is of similar shape but smaller.

A hand tool similar to that used by the carpenter is used for cutting small soft stones. Larger blocks are cut with the two-handed saw worked by two men. For the largest blocks the frame saw is used, and is slung by a rope and pulleys fitted with balance weights to relieve the operator of its weight. The blade is of plain steel, the cutting action being supplied by sand with water as a lubricant constantly applied.

There are perhaps even more varieties of chisels than ofhammers. The point and the punch have very small cutting edges, a quarter of an inch or less in width. The former is used on the harder and the latter on the softer varieties of stone after the rough hammer dressing. The pitching tool has a wide thick edge and is used in rough dressing. Jumppers are shafts of steel having a widened edge, and are used for boring holes in hard stone. Chisels are made with edges from a quarter-inch to one and a half inches wide: those that exceed this width are termed boasters. The claw chisel has a number of teeth from one-eighth to three-eighths wide, and is used on the surface of hard stones after the point has been used. The drag is a semi-circular steel plate, the straight edge having teeth cut on it. It is used to level down the surfaces of soft stones. Cockscombs are used for the same purpose on moulings, and are shaped to various curves. Wedges of various sizes are used in splitting stones and are inserted either in holes made with the jumper or in chases cut with the stone-pick.

The implements for setting out the work are similar to those used, by the bricklayer and other tradesmen, comprising the rule, square, set square, the level capable of being employed in any required angle, compasses, spirit level, plumb rule, and bob and mortar trowels. Gauges and moulds are required in sinking moulds to the proper section.

Setting-out and Setting Tools.

Nippers. Lewis Bolt.

![Fig. 1. Nippers.](image)

![Fig. 2. Lewis Bolt.](image)

The nippers (fig. 1), or scissors, as they are sometimes termed, have two hooked arms fitting into notches in the opposite sides of the block to be lifted. These arms are riveted together by the bricklayer and other tradesmen, comprising the rule, square, set square, the level capable of being employed in any required angle, compasses, spirit level, plumb rule, and bob and mortar trowels. Gauges and moulds are required in sinking moulds to the proper section.

in an ashlars stone wall it would be impossible properly to make these good on the removal of the scaffold (see further SCAFFOLD).

Seasoning Stone.—Stone freshly quarried is full of sap, and thus admits of being easily worked. On being exposed to the air the sap circulates and the stone becomes much harder in consequence. For this reason, and because carriage charges are lessened by the smaller bulk of the worked stone compared with the rough block, the stone for a building is often specified to be quarry-worked. For the same reasons the mason feels encouraged to use the stone when driest, and that it should be seasoned by being allowed to lie two years before being used, so as to allow the natural sap to evaporate.

In the erection of St. Paul’s Cathedral, Sir Christopher Wren required that the stone after being quarried should be exposed for three years before being used, and he provided for the cost of building.

The regular and determined form of bricks makes it to a large extent a matter of practice to enable a man to become a good bricklayer, but beyond these a continual exercise of judgment is required of the workman in order to be able to do the most part to deal with masses of all forms and of all sizes.

Setting Stones.—All beds and joints should be truly worked and perfectly level. If the surface be convex it will give rise to wide un-level joints; if concave the weight thrown on the stone will rest on the edges and probably cause them to "flush" or break off and disfigure the work. Large stones are placed in position with the aid of hoisting appliances and should be tried in position before being fixed. Great care should be taken to avoid fracturing or chipping the stone in the process of handling it, as this will in the long run make good such damage. All stratified stones—and this includes by far the largest proportion of building stones—when set in a level position should be laid on their natural bed, i.e. with their laminæ horizontal. A single layer of stones with flat laminæ laid at right angles to the pressure placed upon it. In the case of arches these layers should be parallel with the centre line of the vousoirs and at right angles to the face of the arch. For cornices (except the cornice of Westminster Abbey, which is based on nature, the stone is set with the laminæ edged and perpendicular to the face of the work. With many stones it is easy to determine the bed by moistening with water, when the laminæ will become apparent. Some stones, however, have been used in such a way as to be impossible to tell whether they have marked in the quarry. A horizontal line in a quarry does not in all cases give the proper bed of the stone, for since the deposits were made ages ago natural upheavals have possibly occurred to the "bed line."

For the shafts of columns especially it is necessary to have the layers horizontally placed, and a stone should be selected from a quarry with a bed of the required depth. An example of the omission of this precaution is visible in the arcing of the Royal Courts of Justice, London, where the shafts of the columns in red sandstone have been turned with the laminæ in a vertical position, with the result that nearly every shaft is flaking away or is cracked from the middle.

Use of Mortar.—See BRICKWORK. Of whatever quality the stone may be of which a wall is built, it should consist as much of stone and as little of mortar as possible. Only fine mortar is admissible if we are to obtain as thin joints as possible. The joints should be well raked out and not left with any mortar left between them. Bonding.—Bond (see BRICKWORK) is of not less importance in stone walling than in brickwork. In ashlar work the bond is worked uniformly, the joints being kept perpendicularly one over the other; but in rubble-work, instead of making the joints recur one over the other in alternate courses they should be slightly turned so as to give the strength of two or three courses or layers between a joint in one course and the joint that next occurs vertically above it in another course. In the through or transverse bonding of a wall the proportion of the thickness of stones running towards the middle of the distance through the width of the wall should be provided to bind the whole structure together. The use of through stones, i.e. stones running through the whole thickness of the wall from front to back, is not in bound to be found; they stones are liable to fracture and convey damp to the internal face.

Slip Joints.—As with brickwork so in masonry great care must be exercised to prevent the different parts of a building settling unequally, by means of slip joints. When the centre of gravity is slightly in height come together, it is usual to employ a slip or housed joint instead of bonding the walls into each other. This arrangement allows the heavier work to settle to a greater extent than the lower part without causing any trouble.

Footings.—The footings of stone walls should consist of large stones of even thickness proportionate to their length; if possible they should be the full breadth in one piece. Each course should be well bedded and levelled.

Walling.—There are broadly speaking two classes of stone walling: rubble and ashlars. Rubble walls are built of stones more or less irregular in shape and size and coarsely jointed. Ashlar walls are constructed of carefully worked blocks of regular dimensions and set with fine joints.
Random Rubble (fig. 3) is the roughest form of stonework. It is built with irregular pieces of stone usually less than 9 in. thick, loosely packed without much regard to courses, the interstices between the large stones being occupied by small ones, the remaining crevices filled up with mortar. Bond stones or headers could be used frequently in every course. This form of walling is much used in stone districts for boundary walls and is often set dry without mortar. For this work the mason uses no tool but the trowel to lay on the mortar, the scabbling hammer to break off the most repulsive irregularities from the stone, and the plumb-rule to keep his work perpendicular.

Coursed Rubble (fig. 4) is levelled up in courses 12 or 18 in. deep, the depth varying in different courses according to the sizes of the stones. The stones are dressed by the workman before he begins building, to obtain a fairly level bed and perpendicular face.

Irregularly Coursed Squared Rubble is a development of uncoursed random rubble, the stones in this case being dressed with the hammer and roughly faced up with the axe. The courses jump abruptly from one level to another as the sizes of the blocks demand; the interstices are filled in with small pieces of stone called “snocks.”

For Coursed Squared Rubble the stone is faced in a similar manner and set in courses, the depth of each course being made up of one or more stones.

In Regular Coursed Rubble all the stones in one course are of the same height.

Block-in-course is the name applied to a form of stone walling that has some of the characteristics of ashlars but the execution of which is much rougher. The courses are usually less than 12 in. high. It is much used by engineers for watersides and railway work where a good appearance is desired.

The Angles or Quoins of rubble-work are always carefully and precisely worked and serve as a gauge for the rest of the walling. Frequently the quoins and jambs are executed in ashlar, which gives a neat and finished appearance and adds strength to the work.

The name Ashlar is given, without regard to the finish of the face of the stone, to walling composed of stones carefully dressed, from 12 to 18 in. deep, the mortar joints being about an eighth of an inch or less in thickness. No stone except the hardest should exceed in length three times its depth when required to resist a heavy load and its breadth should be from one and a half to three times its depth. The hardest stone may have a length equal to four or perhaps five times its depth and a width three times its depth.

The face of ashlar-work may be plain and level, or have rebated, chamfered, or moulded joints.

The cost of this form of stonework renders the employment of ashlar of an inferior nature very general. This backing varies according to the district in which the building operations are being carried on, being rubble stonework in stone districts or brick or concrete elsewhere, the whole being thoroughly tied together both transversely and longitudinally with bondstones. In England a stone much used for backing ashlar and Kentish rag rubble-work is a soft sandstone called “hassock.”

In the districts where it is quarried it is much cheaper than brickwork. (For brickbacking see Brickwork.) Ashlar facing usually varies from 4 to 9 in. in thickness. The work must not be all of one thickness, but should vary in order that effective bond with the backing may be obtained. If the work is in courses of uneven depth the narrow courses are made of the greater thickness and the deep courses are narrow. It is sometimes necessary to secure the stone facing back with iron ties, but this should be avoided wherever possible, as they are liable to rust and split the stonework. When it is necessary to use them they should be covered with some protective coating. The use of a backing to a stone wall, besides lessening the cost, gives a more equable temperature inside the building and prevents the transmission of wet by capillary attraction to the interior, which would take place if single stones were used for the entire thickness.

All work of this description must be executed in Portland cement, mortar of good strength, to avoid as much as possible the unequal settlement of the deep courses of stone facing and the narrower courses of the brick or rough stone backing. If the backing is of brick it should never be less than 9 in. thick, and whether of stone or brick it should be levelled up in courses of the same thickness as the ashlars.

There are many different sorts of walling, or modes of structure, arising from the nature of the materials available in various localities. That is perhaps of most frequent occurrence in which either squared, broken, or round flints are used. This, when executed with care, has a distinctly decorative appearance. To give stability to the structure, facing courses of tiles, bricks or dressed stones are introduced, and brick or stone piers are built at intervals, thus forming a flat panelled wall. The quoins, too, in this type of wall are formed in dressed stone or brick work.

Uncoured rubble built with irregular blocks of ragstone, an unstratified rock quarried in Kent, is in great favour for facing the external walls of churches and similar works (fig. 5).

Pointing.—As with brickwork this is generally done when the work is completed and before the scaffolding is removed. Suitable weather should be chosen, for if the weather be either frosty or too hot the pointing will suffer. The joints are raked out to a depth of half an inch or more, well wetted, and then refilled with a fine mortar composed specially to resist the action of the weather. This is finished by being pressed with a special tool to a shaped joint, the usual forms of which are shown in fig. 6.

Stonewash.—To give a uniform appearance to the stonework and preserve the finished face until a hardened skin has formed, it is usual to coat the surface of exposed masonry with a protective compound of ordinary linewhite with a little size mixed in it, or a special mixture of stone-dust, lime, salt, whiting and size with a little
ochre to tone it down. After six months or more the work is cleaned down with water and stiff bristle or wire brushes. Sometimes muriatic acid much diluted with water is used.

Technical Terms.—Of the following technical terms, many will be found embodied in the drawing of a gable wall (fig. 7), which shows the manner and position in which many different members are used. Apices Stone.—The topmost stone of a gable forming a finial for the two sloping sides; it is sometimes termed a "saddle" (fig. 7).
**Masonry**

**Blocking Course**, a heavy course of stone above a cornice to form a parapet and weigh down the back of the cornice (fig. 8).

![Fig. 8](image)

**Bed.**—The bed surface upon which a stone is set or bedded should be worked truly level in every part. Many workmen to form a neat thin joint with a minimum amount of labour hollow the bed and thus when the stone is set all weight is thrown upon the edges with the frequent result that these are crushed.

**Corner.**—Stones, called *coping* stones, are placed on the top of walls not covered by a roof, spanning their entire width and throwing off the rain and snow, thus keeping the interior of the wall dry. The fewer the number of joints the better the security, and for this reason a square pattern is sought with as long stones as possible. To throw water off clear, and prevent it from running down the face of the wall, the coping should project an inch or two on each side and have a throat worked on the under-side of the projections (fig. 7).

**Cornice.**—A projecting course of moulded stone crowning a structure, forming a cap or finish and serving to throw away any wet clear of the walls. A deep drip should always be worked in the upper members of a cornice to prevent the rain trickling down and disfiguring the moulding and the wall below (fig. 8). Early work it was often dressed to a slope and the stone was quoined to a miter joint.

**Corbel.**—A stone built into a wall and projecting to form a cantilever, supporting a load beyond the face of the wall. It is frequently ornamented by carving (fig. 7). Stone Corbel, a stone placed at the base of the sloping side of a gable wall to resist any sliding tendency of the coping stones. Stones placed for a similar purpose at intervals along the sloping side, tiling into the wall, are termed "kneelers" and have the section of the coping worked upon them (fig. 7).

**Corbel Table.**—A line of small corbels placed at short distances apart supporting a parapet or arcade. This forms an ornamental feature which was much employed in early Gothic times. It probably originates from the machicolation of ancient fortresses.

**Cost.**—The slabs of dressed stone and window and door jambs and quoin. For example, a "brick building with stone dressings" would have brick walls with stone door and window jambs, heads and sills, and perhaps also stone quoin (fig. 7).

**Dip.**—A square pattern formed on the face of the stone by means of stones of different colours and varieties or by patterns carved on the surface (fig. 7).

**Finial.**—A finishing ornament applied usually to a gable end (fig. 7).

**Gable.**—A stone placed at the apexes of the angles of the roof, often elaborately carved panels frequently used in Gothic stonework for apes stones, and in spires, &c.

**Gargoyle.**—A detail, not often met with in modern work, which consists of a waterspout projecting so as to throw the rain-water from the gutter around a central axis. In early work it was often carved into grotesque shapes of animal and other forms.

**Galluret.**—The joints of rubble are sometimes enriched by having small pebbles or chips of flint pressed into the mortar whilst green.

**Jamb.**—Window and door jambs should always be of dressed stone, both on account of the extra strength thus gained and in order to give a finish to the work. The stones are laid alternately as stretchers and headers; the former are called outbands, the latter inbands (fig. 7).

**Label Moulding.**—A projecting course of stone running round an arch. When not very large it is sometimes cut on the voussoirs, but is usually made a separate course of stone. Often, and especially in the case of door openings, a small sinking is worked on the top surface of the moulding to form a gutter which leads to the sides any water that trickles down the face of the wall.

**Lacing Stone.**—This is placed as a voussoir in brick arches of wide span, and serves to bond or face several courses together (see Brickwork).

**Lacing Course.**—A course of dressed stone, bricks or tiles, run at intervals in a wall of rubble or flint masonry to impart strength and tie the whole together (fig. 7).

**Long and Short Work.**—A typical Saxon method of arranging quoin stones, flat slabs and long narrow vertical stones being placed alternately. Earls Barton church in Northamptonshire is an example of their use in old work. In modern work long and short work, sometimes termed "block and start," is little used (fig. 7).

**Parapet.**—A wall at the top of a wall or the eaves of the roof. The gutter lies below, and the overflows are formed through the parapet wall for the escape of the rain-water.

**Plinth.**—A projecting base to a wall serving to give an appearance of stability to the work. Quoin, the angle at the junction of two walls. Quoins are often faced in dressed stone (fig. 7).

**Rag-bolt.**—An end of an iron bolt when required to be let into stone is roughed or ragged. A dovetailed mortise is prepared in the stone and the ragged end of the bolt is projected and the mortise filled in with molten lead or sand and sulphur (fig. 9).

**Sill.**—The stone which forms a finish to the wall at the bottom of an opening. Sills should always be weathered slightly in the case of door sills, more sharply for windows, and throned on the under-side to throw off the wet. The weathering is not carried through the whole length of the sill, but a stool is left on at each end to form a square end for building in (fig. 7).

**String Courses.**—Horizontal bands of stone, either projecting beyond or flush with the face of the wall, often moulded or carved. They are frequently continuations of the sill or head lines of windows (fig. 5).

**Sprocket.**—In a thick wall the dressed stones forming the inside of the sprocket, the slot or key of the dressed sprockets.

**Spalls.**—Small pieces chipped off whilst working a stone.

**Templates.**—Slabs of hard stone set in a wall to take the ends of a beam or girder so as to distribute the load over a larger area of the wall.

**Tympanum.**—The triangular filling of masonry in a pediment between the corinices, or between the horizontal head of a window or door and the under-side of the relieving arch above it. It is often panelled or enriched with carved ornament (fig. 7).

**Tooth-chiselled Work.**—The cheapest method of dressing soft stones is by the toothed chisel which gives a surface very much like the pointed work of hard stones.

**Trowelled Work.**—This is obtained with a chisel about two and a half inches wide, no attempt being made to keep the cuts in continuous lines.

**Toolled Work** is somewhat similar to trowelled work and is done with a flat chisel, the edge of which is about four inches wide, and calls for the cuts to be made in continuous lines across the width of the stone.

**Combed or Dragged Work.**—For soft stones the steel comb or drag is often employed to remove all irregularities from the face and thus form a fine surface. These tools are specially useful for moulded work as they cut a series of curves.

**Roughed Work.**—For this finish the surface of the stone is previously brought with the chisel to a level and approximately smooth face, and then the surface is rubbed until it is quite smooth with a piece of grit stone aided by fine sand and water as a lubricant. Marbles are sometimes lubricated with gritstone, then with pumice, and lastly with emery powder.

Besides these, the most usual methods of finishing the faces of stonework, there are several kinds of surface formed with hammers or other tools, especially in various descriptions. These types of hammers are more used on the continent of Europe and in America perhaps than in England, but they deserve notice here.
The 

The toothed axe has its edges divided into teeth, fine or coarse according to the work to be done. It is used to reduce the face of limestone and sandstones to a condition ready for the chisel. The bush hammer has a heavy square-shaped double-faced head, upon which are cut projecting pyramidal points. It is used to form a surface full of little holes, and with it the face of sand and limestone may be brought to a somewhat ornamental finish. The patent hammer is used on granite and other hard rocks, which have been first dressed to a medium surface with the point. The fineness of the result is determined by the number of blades in the hammer, and the work is said to be “six,” “eight” or “ten-cut” work according to the number of blades inserted or bolted in the hammer head. The cramp has an iron handle slotted at one end with a hole ¼ in. wide and 3 in. long. In this slot are fixed by a key ten or eleven double-headed points of ¼ in. square steel each about 9 in. long. It is used for finishing sandstone and soft stones after the surface has been levelled down with the axe or chisel. It gives a fine pebbly sparkling appearance.

There are several methods of finishing stone which involve a great deal of labour and are therefore expensive to work, but which result in imparting a very stiff and unnatural appearance to the masonry.

Vermiculated Work.—This is formed by carving a number of curling worm-like lines over the face of the block, sinking in between the worms to a depth of a fourth of an inch. The surface of the strings is worked smooth, and the sinkings are pock-marked with a pointed tool (fig. 7).

Furrowed Work.—In this face the stone is cut with a chisel into a number of small parallel grooves or furrows (fig. 7).

Reticulated Face is a finish somewhat similar to vermiculated work, but the divisions are more nearly squares.

Face Joints of Ashlar.—The face joints of ashlar stonework are often sunk or rebated to form what are termed rusticated joints; sometimes the angles of each block are moulded or chamfered to give relief to the surface or to show a massive effect (fig. 7).

Joints in Stonework.—The joints between one block of stone and another are formed in many ways by cramps, dowels and joggles of various descriptions.

Dowels are used for connecting stones where the use of cramps would be impracticable, as in the joints of window Mullions, the shafts of small columns, and in similar works (figs. 7, 8 and 20).

Dowels. Dowels for bed and side joints may be used. They are of slate, metal, or sometimes of hard wood.

There are many ways of making a joggle joint. The joggle may be worked on one of the stones so as to fit into a groove in the adjoining stone, or grooves may be cut in both the stones and an independent joggle of slate, pebbles, or Portland cement fitted, the joggle being really a kind of dowel. The pebble joggle joint is formed with the aid of pebbles as small dowels fitted into mortises in the joint faces of two stones and set with Portland cement; but joggles of slate have generally taken the place of pebbles. Portland cement joggles are formed by pouring cement grout into a vertical or oblique mortise formed by cutting a groove in each of the joining surfaces of the stones. What is known as a be-and-she joggle, worked on the edges of the stones themselves, is shown in fig. 13.

Plugs or dowels of lead are formed by pouring molten lead through a channel into dovetailed mortises in each stone (figs. 14 and 15). When cold the metal is caulked to compress it tightly into the holes.

The saddle joint is used for cornices, and is formed when a portion of the stone next the joint is left raised so as to guide rain-water away from the joint (fig. 8).

Two forms of rebated joints for stone copings and roofs are common. In one form (shown in fig. 7) the stones forming the coping are thicker at their lower and rebated edge than at the top plain edge, giving a stepped surface. The other form has a level surface and the stone is of the same thickness throughout and worked to a rebate on top and bottom edges. In laying stone roofs the joints are usually lapped over with an upper slab of stone.

Joints in Spires.—Four forms of jointing for the battering stone-work of spires are shown in fig. 16. A is a plain horizontal joint. B is a similar joint formed at right angles to the face of the work. This is the most economical form of joint, the stone being cut with its sides square with each other; but if the mortar in the joint decay moisture is allowed to penetrate. With these
forms dwelling is frequently necessary for greater stability. The joints C and D are more elaborate and much more expensive on account of the extra labour involved in working and fitting.

Where a concentrated weight is carried by piers or columns the bed joints are in many cases formed without the use of mortar, a thin sheet of milled lead being placed between the blocks of stone to fill up any slight inequalities.

Moulded Work.—The working of mouldings in stone is an important part of the mason's craft, and forms a costly item in the erection of a stone structure. Much skill and care is required to retain the arisings sharp and the curved members of accurate and proportionate outline. As in the case of wood mouldings, machinery now plays an important part in the preparation of stone moulded work. The process of working a stone by hand labour is as follows: The profile of the moulding is marked on to a zinc template on opposite ends of the stone to be worked; a short portion, an inch or two in length termed a "draught," is at each end worked to the required section. The remaining portion is then proceeded with, the craftsman continually checking the accuracy of his work with a straight-edge and zinc templates. A stone to be moulded by machinery is fixed to a moving table placed under a shaped tool which is fixed in an immovable portion of the machine, and is so adjusted as to cut or chip off a small layer of stone. Each time the stone passes under the cutter it is automatically moved a trifle nearer, and thus it gradually reduces the stone until the required shape is attained.

Iron in Stonework.—The use of iron dowels or cramps in stonework, unless entirely and permanently protected from oxidation is attended by the gravest risks; for upon the expansion of the iron by rusting the stone may split, and perhaps bring about a more or less serious failure in that portion of the building. A case in point is that of the church of St Mary-le-Strand, London, where the ashlar facing was secured to the backing with iron cramps; these were inefficiently protected from damp, with the result that many of the blocks have been split in consequence of rusting. John Smeaton in his Eddystone Lighthouse used dowels of Purbeck marble.
Stone Arches.—Stone arches are very frequently used both in stone and brick buildings. (For general definitions and terms see BRICKWORK.) They may be built in a great variety of styles, either flat, segmental, circular, elliptical or pointed. Each block or voussoir should be cut to fit exactly in its appointed place, the joints being made as fine as possible. The joints should radiate from the centre from which the soft or intrados is struck, or, in the case of an elliptical arch they should be at right angles to a tangent drawn to the intrados. The voussoirs of the arch are usually concentric with the intrados, but are sometimes made thicker in one portion than in another; thus the arch may be deeper at the crown than at the sides, or at the sides than in the centre. In some cases two or more voussoirs are of one stone, having a false joint cut in the centre; this is economical, and adds to the strength of the arch. Generally the arch is divided into an uneven number of voussoirs so as to give a keystone, the voussoirs being laid from each side of the keystone and fitting exactly in the centre of the arch. The voussoirs which are not necessary, arches being frequently formed by an even number of voussoirs; some architects hold that the danger of the voussoirs cracking is thereby lessened. Where lintels are used in a stone wall over openings of small span it is usual to build a relieving arch above to take the superincumbent weight of the lintel or the same purpose may be effected in walls of ashlar by a flat relieving or save arch, formed in the next course of three stones above the lintel, the tappering keystone resting between the side stones and laid into the joint between them.

In many cases it is desired to form square heads to openings of greater span than it is convenient to obtain lintels for in one piece, and some form of flat arch must therefore be adopted. The voussoirs are placed horizontally and are laid as near as possible to the position they will occupy in the arch. The weight of the superimposed wall is taken by a lintel with relieving arch above at the back of the arch.

Arches built to an elliptical form when used for large spans (if of brick) are usually built as voussoirs, a keystone being adopted, heavily loaded to fail by the voussoirs at the centre being forced down, or else to burst up at the haunches. With arches of this description there is a large amount of outward thrust, and abutments of ample strength must be placed to receive the springers.

Stone Tracery.—The designing of the tracery included in the arch work are almost infinite, and there are many methods, ingenious and otherwise, of setting out such work. Nearly all diagrams of construction are planned on the principle of geometrical intersections. In the case of a pointed arch, the construction of the arch is set out, finishing the design is very clearly shown, together with the best positions for the joint of the various parts. The joining is a matter which must be carefully considered in order to avoid any wasting of material and observation may be made that the right-hand side of the elevation shows the method of setting out the tracery by the centre lines of the various intersecting branches, the other half giving the completed design with the cusp shown in the position which it will be in the wall. The centre of the window and doors and of aisle arches should be protected from superincumbent pressure by strong relieving arches above the labels, as shown in the figure, which should be worked with the ordinary masonry, and so shaped that the weight above should avoid pressure on the air work, which would be liable to flush or otherwise destroy the joints of the tracery.

Carving.—Stone carving is a craft quite apart from the work of the artistic stone mason. It is both a practical and theoretical subject, requiring much analytical feeling and artistic training. Carving-stone should be of fine grain and sufficiently soft to admit of easy working. The Bath stones in England and the Caen stone of France are largely used for internal work. Harder stones should be of some chemical preservative. Carving is frequently done after the stone is built into position, the face being left rough—and projecting sufficiently for the intended design.

MASPERO, GASTON CAMILLE CHARLES (1840-1913) French Egyptologist, was born in Paris on the 23rd of June 1846, his parents being of Lombard origin. While at school he showed a special taste for history, and when fourteen years old was already interested in hieroglyphic writing. It was not until his second year at the École Normale in 1867 that Maspero met with an Egyptianist in the person of Mariette, who was then in Paris as commissioner for the Egyptian section of the exhibition. Mariette gave him two newly discovered hieroglyphic texts of considerable difficulty to study, and, self-taught, the young scholar produced translations of them in less than a fortnight, a great feat in those days when Egyptology was still almost in its infancy. The publication of these in the same year established his reputation. A short time was spent in assisting a gentleman in Peru, who was seeking to prove an Aryan affinity for the dialects spoken by the Indians of that country; to publish his researches; but in 1868 Maspero was back in France at moderate remuneration. In 1869 he became a teacher (répétiteur) of Egyptian language and archaeology at the École des Hautes Études; in 1874 he was appointed to the chair of Champollion at the Collège de France.

In November 1880 Professor Maspero went to Egypt as head of an archaeological mission despatched thither by the French government, which ultimately developed into the well-equipped Institut Français de l'Archéologie Oriental. This was but a few months before the death of Mariette, whom Maspero then succeeded as director-general of excavations and of the antiquities of Egypt. He held this post till June 1886; in these five years he had organized the mission, and his labours for the Bulak museum and for archaeology had been early rewarded by the discovery of the great cache of royal mummies at Deir el-Bahri in July 1881. Maspero now resumed his professorial duties in Paris until 1899, when he returned to Egypt in his old capacity as director-general of the department of antiquities. He found the collections in the Cairo Museum enormously increased, and he had in view to move them to the new quarters at Kasr en-Nil in 1902. The vast catalogue of the collections made rapid progress under Maspero's direction. Twenty-four volumes or sections were already published in 1900. The repairs and clearances at the temple of Karnak, begun in his previous tenure of office, led to the most remarkable discoveries in later years (see KARNAK), during which a vast amount of excavation and exploration has been carried on also by unofficial but authorized explorers of many nationalities.

Among his best-known publications are the large Histoire ancienne des peuples de l'Orient classique (3 vols., Paris, 1865-1867, translated into English by Mrs McClure for the S.P.C.K.), displaying in a masterly manner the whole history of the peoples to the conquest by Alexander; a smaller Histoire des peuples de l'Orient, 1 vol., of the same scope, which has passed through six editions from 1875 to 1904; Études de mythologie et d'archéologie égyptiennes (Paris, 1893, &c.), a collection of reviews and essays originally published in various journals, and especially important as contributions to the study of Egyptian religion; L'Archéologie égyptienne (latest ed., 1907), of which several editions have been published in English. He also established the journal Recueil de travaux relatifs à la philologie et à l'archéologie égyptiennes et assyriennes; the Bibliothèque égyptologique, in which the scattered essays of the French Egyptologists are collected, with bibliographies, the Annales de la mission archéologique des peuples des antiquités de l'Égypte, a repository for reports on official excavations, &c.

Maspero also wrote: Les Inscriptions des pyramides de Saggara (Paris, 1894); Les Monnaies royales de Deir el-Bahari (Paris, 1889); Historie des monnaies de l'Égypte, ancienne et moderne (3d ed., Paris, 1906); Gussieres d'Egypte (1907), translated by Elizabeth Lee as New Light on Ancient Egypt (1908).

MASS (O.E. massa; Fr. masse; Ger. Messe; Ital. messa; from ecc. Lat. missa), a name for the Christian eucharistic service, practically confined since the Reformation to that of the Roman Catholic Church. The various orders for the celebration of Mass are dealt with under LITURGY; a detailed account of the Roman order is given under MISSAL; and the general development of the eucharistic service, including the Mass, is described in the article EUCHARIST.

The present article is confined (1) to the consideration of certain special meanings which have become attached to the word Mass and are the subject of somewhat acute controversy, (2) to the Mass in music.

The origin of the term Mass is obscure. The first to discuss the matter is Isidore of Seville (Etym. vi. 10), who mentions an "evening office" (oficium vesperum), a "morning office" (oficium matutinum), and an office called missa. Of the latter he says: "Missa tempore sacrificii est, quando catechumeni forsunt, etiam clarente levita si quis catechumenus remanit, exeat foras." Et inde missa, quia sacramentis altariis interesse non posunt, qui nondum regenerantur ("The missa is at the time of the sacrifice, when the catechumen are sent out, the deacon crying, 'If any catechumen remain, let him go forth.'"

Hence missa, because those who are as yet unregenerate—i.e., unbaptized—may not be present at the sacraments of the altar). This derivation of
the word Mass, which would connect it with the special formula of dismissal still preserved in the Roman liturgy—*Ite, missa est*—once generally accepted, is now disputed. It is pointed out that the word *missa* long continued to be applied to any church service, and more particularly to the lections (see *Du Cange* for numerous examples), and it is held that such services received their name of *missal* from the solemn form of dismissal with which it was customary to conclude them; thus, in the 4th century *Pilgrimage of Eitheria* (*Silvia*) the word *missa* is used indiscriminately of the Eucharist, other services, and the ceremony of dismissal. F. Kattenbusch (*Herzog-Hauck, Realencyclopädie*, s. “Messe”) ingeniously, but with little evidence, suggests that the word may have had a double origin and meaning: (1) in the sense of *dimissio*, “dismission”; (2) in that of *commissio*, “commission,” “official duty,” i.e. the exact Latin equivalent of the Greek *lēgō* (*see Liturgy*), and hence the conflicting use of the term. It is, however, far more probable that it was a general term that gradually became crystallized as applying to that service in which the dismissal represented a more solemn function. In the narrower sense of “Mass” it is first found in St. Ambrose (*Ep.*, 28, 4, ed. Ballerini): “Missam facere coepti. Dum offero...” which evidently identifies the *missa* with the sacrifice of the Lorde and holy communion. However, though its tendency to become proper only to the principal Christian service is clear from a passage in the 12th homily of Caesarius, bishop of Arles (d. 542): “If you will diligently attend, you will recognize that *missae* are not celebrated when the divine readings are recited in the church, but when gifts are offered and the Body and Blood of the Lord are consecrated.” The complete service (*missa ad integrum*), the bishop goes on to say, cannot be had at home by reading and prayer, but only in the house of God, where, besides the Eucharist, “the divine word is preached and the blessing is given to the people.”

Whatever its origin, the word Mass had by the time of the Reformation been long applied only to the Eucharist; and, though in itself a perfectly colourless term, and used as such during the earlier stages of the 16th century controversies concerning the Eucharist, it soon became identified with that sacrificial aspect of the sacrament of the altar which it was the chief object of the Reformers to overthrow. In England, so late as the first Prayer-book of Edward VI., it remained one of the official designations of the Eucharist, which is there described as “The Supper of the Lorde and holy Communion, commonly called the Mass.” This, however, like the service itself, represented a compromise which the more extreme reformers would not tolerate, and in the second Prayer-book, together with such language in the canon as might imply the doctrine of transubstantiation and of the sacrifice, the word Mass also disappears. That this abolition of the word Mass, as implying the offering of Christ’s Body and Blood by the priest for the living and the dead was deliberate is clear from the language of those who were chiefly responsible for the change. Bishops Ridley and Latimer, the two most conspicuous champions of “the new religion,” denounced “the Mass” with unmeasured violence; Latimer said of “Mistress Missa” that “the devil hath brought her in again”; Ridley said: “I do not take the Mass as it is at this day for the communion of the Church, but for a popish device,” &c. (*Works*, ed. Parker Soc., pp. 121, 120), and again: “In the stead of the Lord’s holy table they give the people, with much solemn disguising, a thing which they call their mass; but in deed and in truth it is a very masking and mockery of the true Supper of the Lord, or rather I may call it a crafty juggling, whereby these false things and jugglers have bewitched the minds of the simple people... unto pernicious idolatory” (*ib.*, p. 400). The language is reflected in the 31st of the Articles of Religion of the Church of England: “Wherefore the sacrifices of Masses, in which it was commonly said that the Priest did offer Christ for the quick and the dead, to have remission of pain and guilt, were blasphemous fables and dangerous decepts.” Clearly the word Mass had ceased to be a colourless term generally applicable to the eucharistic service; it was, in fact, not only proscribed officially, but in the common language of English people it passed entirely out of use except in the sense in which it is defined in Johnson’s Dictionary, i.e. that of the “Service of the Romish Church at the celebration of the Eucharist.” In connexion with the Catholic reaction in the Church of England, which had its origin in the “Oxford Movement” of the 19th century, efforts have been made by some of the clergy to reintroduce the term “Mass” for the Holy Communion in the English Church.

See *Du Cange*, *Glossarium*, s.v. “Missa”; F. Kattenbusch in Herzog-Hauck, *Realencyclopädie* (ed. 1903), s.v. “Messe, dogmengeschichtlich”; for the facts as to the use of the word “Mass” at the time of the Reformation see the article by J. H. Round in the *Nineteenth Century* for May 1897.

(W. A. P.)

**MASS, in MUSIC.** 1. *Polyphonic Masses.*—The composition of musical settings of the Mass plays a part in the history of music which is of special importance up to and including the 16th century. As an art-form the musical Mass is governed to a peculiar degree by the structure of its text. It so happens that the supremely important parts of the Mass are those which have the smallest number of words, namely the *Kyrie*, important as being the opening prayer; the *Sanctus* and *Benedictus*, embodying the central acts and ideas of the service; and the *Agnus Dei*, the prayer with which it concludes. The 16th-century methods were specially fitted for highly developed music when words were seen and emptied. Ideas of such important emotional significance became fixed in the mind and were not changed by the frequent or even by the one without losing force. Now the texts of the *Gloria* and *Credo* were more voluminous than any others which 16th-century composers attempted to handle in a continuous scheme. The practical limits of the church service made it impossible to break them up by setting each clause to a separate movement, a method by which 16th-century music composers contrived to set psalms and other long texts to compositions lasting an hour or longer. Accordingly, Palestrina and his great contemporaries and predecessors treated the *Gloria* and *Credo* in a style midway in polyphonic organization and rhythmic breadth between that of the elaborate motet (adopted in the *Sanctus*) and the homophonic reciting style of the Litany. The various ways in which this special style could be modified by the scale of the work, and contrasted with the broader and more elaborate parts, gave the Mass (even in its merely technical aspects) a range which made it to the 16th-century composer what the symphony is to the great instrumental classics. Moreover, as being inseparably associated with the highest act of worship, it inspired composers in direct proportion to their piety and depth of mind. Of course there were many composers at this time who seemed to have set *Gloria* and *Credo* without the actual text, treating them as bits of music, and inventing new words or paraphrasing the text. But the composers of the great masses were a select company, and of the score of masses by Eemerick the only one that has any claim to be called a true mass is the Missa *Festa* in which the words of the Motets are abbreviated.

2. *Instrumental Masses in the Neapolitan Form.*—The next definite stage in the musical history of the Mass was attained by the Neapolitan composers who were first to reach musical coherence after the monodic revolution at the beginning of the 17th century. The fruit of their efforts came to maturity in the Masses of Mozart and Haydn. By this time the resources of music were such that the long and varied text of the *Gloria* and *Credo* inevitably either overbalanced the scheme or met with an obviously perfunctory treatment. It is almost impossible, without asceticism of a radically inartistic kind, to treat with the resources of instrumental music and free harmony such passages as that from the *Crucifixus* to the *Resurrexi*, without objection of contrast, without consideration of the inevitability of the natural treatment of the *Sanctus* into the background, and makes the *Agnus Dei* an inadequate conclusion to the musical scheme. So unfavourable were the conditions of 18th-century music for the formation of a good ecclesiastical style that only a very small proportion of Mozart’s and Haydn’s Mass music may be said to represent their ideas of religious music at all. The best features of their Masses are those that combine faithfulness to the Neapolitan forms with a contrapuntal richness such as no Neapo-
jitan composer ever achieved. Thus Mozart’s most perfect as well as most ecclesiastical example is his extremely terse Mass in F, written at the age of seventeen, which is scored simply for four-part chorus and solo voices accompanied by the organ with a largely independent bass and by two violins mostly in independent real parts. This scheme, with the addition of a pair of trumpets and drums and, occasionally, oboes, forms the normal orchestra of 18th-century Masses developed or degenerated from this model. Trombones often played with the three lower voices, a practice of high antiquity surviving from a time when there were soprano trombones or cornetti (Zincken, a sort of treble serpent) to play with the sopranos.

3. Symphonic Masses.—The enormous dramatic development in the symphonic music of Beethoven made the problem of the Mass with orchestral accompaniment almost insoluble. This makes it all the more remarkable that Beethoven’s second and only important Mass (in D, Op. 125) is not only the most dramatic ever penned but is, perhaps, the last classical Mass that is thoughtfully based upon the liturgy, and is not a mere-musical setting of what happens to be a liturgical text. It was intended for the installation of Beethoven’s friend, the archduke Rudolph, as archbishop of Olmütz; and, though not ready until two years after that occasion, it shows the most careful consideration of the meaning of a church service, no doubt of altogether exceptional length and pomp, but by no means impossible for its unique occasion. Immense as was Beethoven’s dramatic force, it was equalled by his power of sublime repose; and he was accordingly able once more to put the supreme moment of the music where the service requires it to be, viz. in the Sanctus and Benedictus. In the Agnus Dei the circumstances of the time gave him something special to say which has never so imperatively demanded utterance since. Europe had been shattered by the Napoleonic wars. Beethoven read the final prayer of the Mass as a “prayer for inward and outward peace,” and, giving it that title, organized it on the basis of a contrast between terrible martial sounds and the triumph of peaceful themes, in a scheme none the less spiritual and sublime because those who first heard it had derived their notions of the horror of war from living in Vienna during its bombardment. Critics who have lived in London during the relief of Mafeking have blamed Beethoven for his realism.

Schubert’s Masses show rather the influence of Beethoven’s not very impressionistic Mass, which they easily surpass in interest, though they rather pathetically show an ignorance of the meaning of the Latin words. The last two Masses are later than Beethoven’s Mass in D and contain many remarkable passages. It is evident from them that a dramatic treatment of the Agnus Dei was “in the air” all the more so, since Schubert does not imitate Beethoven’s realism.

4. Lutheran Masses.—Music with Latin words is not excluded from the Lutheran Church, and the Kyrie and Gloria are frequently sung in succession and entitled a Mass. Thus the Four Short Masses of Bach are called short, not because they are on a small scale, which is far from being the case, but because they consist only of the Kyrie and Gloria. Bach’s method is to treat each clause of his text as a separate movement, alternating choruses with groups of arias; a method which was independently adopted by Mozart in those larger masses in which he transcends the Neapolitan type, such as the great unfinished Mass in C minor. This method, in the case of an entire Mass, results in a length far too great for a Roman Catholic service; and Bach’s B minor Mass, which is such a setting of the entire text, must be regarded as a kind of opera. Bach thus has obviously not tried to do with the Roman liturgy what he did with the Neapolitan liturgy; but, with an independent setting of the text it is one of the most sublime and profoundly religious works in all art; and its singular perfection as a design is nowhere more evident than in its numerous adaptations of earlier works.

The most interesting of all these adaptations is the setting of the words: “Et expecto resurrectionem mortuorum et vitam venturi saeculi.—AMEN.” Obviously the greatest difficulty in any elaborate instrumental setting of the Credo is the inevitable anti-climax after the Resurrexit. Bach contrives to give this anti-climax a definite artistic value; all the more from the fact that his Crucifixus and Resurrexit, and the contrast between them, are among the most sublime and directly impressive things in all music. To the end of his Resurrexit chorus he appends an orchestral riornello, summing up the material of the chorus in the most formal possible way, and thereby utterly destroying all sense of finality as a member of a large group, while at the same time not in the least impairing the force and contrast of the whole—that contrast having ineffaceably asserted itself at the moment when it occurred. After this the aria “Et in spiritum sanctum,” in which the next dogmatic clauses are enshrined like relics in a casket, furnishes a beautiful decorative design on which the listener can repose his mind; and then comes the voluminous ecclesiastical fugue, Confessor unum baptismas, leading, as through the door and world-wide spaces of the Catholic Church, to that well which is not all darkness to the eye of faith. At the words “Et expecto resurrectionem mortuorum,” the music plunges suddenly into a slow series of some of the most sublime and mysterious modulations ever written, until it breaks out as suddenly into a vivace e allegro of broad tertse character, which comes to its climax very rapidly and ends as abruptly as possible, the last chord being carefully written as a short note without a pause. This gives the utmost possible effect of finality to the whole Credo, and contrasts admirably with the boldly formal instrumental end of the Resurrexit three movements further back. Now, such subtleties seem as if they must be unconscious on the part of the composer; yet here Bach is so far aware of his reasons that his vivace e allegro is an arrangement of the second chorus of a church cantata, Gott man lobet dich in der Stille, and in the cantata the chorus has introductory and final symphonies and a middle section with da capo!

5. The Requiem.—The Missa pro defunctis or Requiem Mass has a far less definite musical history than the ordinary Mass; and such special musical forms as it has produced have little in common with each other. The text of the Dies Irae so imperatively demands either a very dramatic elaboration or none at all, that even in the 16th century it could not possibly be set to continuous music on the lines of the Gloria and Credo. Fortunately, however, the Gregorian canto fermo associated with it is of exceptional beauty and symmetry; and the great 16th century masters either, like Palestrina, left it to be sung as plain-chant, or obviated all occasion for dramatic expression by setting it in verses (like their settings of the Magnificat and other canticles) for two groups of voices alternatively, or for the choir in alternation with the plain chant of the priests.

With modern orchestral conditions the text seems positively to demand an uneclesiastical, not to say sensational, style, and probably the only instrumentally Requiem Masses which can be said to be great church music are the sublime unfinished work of Mozart (the antecedents of which would be a very interesting subject) and the two beautiful works by Cherubini. These latter, however, tend to be funereal rather than uplifting. The only other artistic solution of the problem is to follow Berlioz, Verdi and Dvořák in the complete renunciation of all ecclesiastical style.

Brahms’s Deutsches requiem has nothing to do with the Mass for the dead, being simply a large choral work on a text compiled from the Bible by the composer.

(D. F. T.)

MASSA, a town of Tuscany, Italy, the joint capital with Carrara of the province of Massa and Carrara, and sharing with it the episcopal see, 20 m. S.E. of Spezia by rail, 240 ft. above sea-level. Pop. (1901), 15,559 (town); 26,118 (commune). The town of Massa is on the Garfagnana coast, and has a port. Among its buildings, which are in Romanesque and Gothic styles, was a summer residence of Napoleon’s sister, Elisa Baciocchi, princess of Lucca, who caused the ancient cathedral opposite to be destroyed. The hills round the town yield marble, and there is a narrow-gauge railway to the Marina d’Avenza, where the marble is shipped.

MASSACHUSETTS (an Indian name, originally applied to a tribe of Indians), one of the original thirteen states of the American Union, bounded on the N. by Vermont and New Hampshire, on the E. by the Atlantic, on the S. by Rhode Island
and Connecticut, and on the W. by New York. It lies approximately between 41° 15' and 45° 30' N. lat. and 69° 55' and 73° 30' W. long. The size of its area—which is about 8260 sq. m. (of which 227 are water)—forms a parallelogram of 130 m. E. and W., 646 m. N. and S., the additional area lying in a projection at the S.E. and a lesser one at the N.E., which give the mainland a breadth of 90 m. where it borders upon the ocean, while the general irregularity of the coast-line gives a frontage of about 250 m.

Physical Features.—The east and south-east portions are in general undulating or level, the central hilly and broken, and the west rugged, and comparatively undivided. (Massachusetts. 851) The Hoosac Hills (1200-1600 ft.) separate the valleys of the Hoosic and Connecticut, which are a part of the Appalachian system, and of which the Hoosic forms the main body. Between Vermont, and east of the Taconic range on the west side of the Hoosic—of which the highest points are Greylock, or "Saddleback" (3535 ft.), and Mt Williams (3040 ft.)—in the extreme north-west corner of the state, form the only considerable elevated land. Lying on the lowlands of the Connecticut, Mt Tom (1214 ft.) and a few other hills (Mt Hoosic, 954 ft.; Mt Toby, 1275 ft.) form conspicuous landmarks. East of this valley the country continues more or less level, and fairly well watered, but gradually becomes more and more slight and of little consequence. Mt Lincoln (1040 ft.) and especially Mt Wachusett (2108 ft.), to the east in a level country, are very exceptional. The Blue Hills in Milton are the nearest elevations to the Boston ridge-line. The rest of the south-east corner of the state is a sandy lowland, generally level with a slightly elevated ridge (Manomet) south of Plymouth, and well watered by ponds.

With the exception of this Connecticut, Massachusetts is a part of the slanting upland that includes all of southern New England. This upland is an uplifted peneplain of subaerial denudation, now so far advanced in a "second" cycle of weathering and so thoroughly dissected as to be reduced to a series of hills confusedly arranged. The general contour of the upland, marked by a remarkably even sky-line, is evident at almost every locality in the state. In the nature and position of the upland rock, especially schists, schistose gneisses, exfoliated and disintegrated in many cases, there is found that uniform depth of surficial materials that have been worn away in forming the generally even skyline. Monadnock (in New Hampshire, near N.E. Massachusetts), the Blue Hills near Boston, Greylock, in the north-west, and Wachusett in the centre, are the most commanding remnants-summits (known generally as "Monadnocks") of the original mountain system. But in the derelict valley, peneplains developed in the present cycle of denudation, and there are residual summits also; in the Connecticut Valley trap ridges, and in the Berkshire hills. From the upland rests upon Mt Hoosic, lava necks; occasionally in the lowlands, ridges of resistant sandstone, like Deerfield Mountain near Northampton; in the Berkshire Valley, summits of resistant schists, like Greylock, relieves the general level. The Berkshire has cut their channels to very moderate gradients, but the smaller ones are steeper. The Hoosic and Millers (and the Connecticut also, but in its course within Massachusetts alone) afford beautiful examples of the dependence of valley breadth upon the strike of soft or harder rocks across the stream. The Connecticut lowland is cut from 5 to 10 m. wide in soft sandstones and shales. The glacial era has left abundant evidences in the topography of the state. The ice covered even the Monadnock, and its deposits abound on the lowland about Boston and the Highlands near Spencer; mononic hills, extending, e.g. all along Cape Cod; eskers, kames and river terraces afford the plainest evidences of the extent of the glacial sheet. The Berkshire country—Berkshire, Hillsborough, Cheshire—forms the high plateau, and comprises the most beautiful regions of the United States. It is a rolling highland dominated by long, wooded hill-ridges, remarkably even-topped in general elevation, intersected and broken by deep valleys. Scores of lakes and small ponds dot the landscape. They are the Lake Region of America, partly from the comparability of its scenic beauties with the English Lake Country (Matthew Arnold, however, wrote: "The country is pleasing but not to be compared with the English," and William Cullen Bryant, "The lakes and nor lakes are so effective.") and partly from the parallelism of literary associations. It has become since 1850, and especially in much more recent years, a favoured resort of summer residents. Owing to topography, and also to the manner in which Massachusetts was settled, the western counties were long connected commercially more closely with New York than with Massachusetts, and this territory was long in dispute between these two states. The Connecticut is the most considerable stream, and is navigable by small boats. Its tributary, the richest portion of the state agriculturally, is celebrated for the quiet variety and beauty of its scenery. The Housatonic, in portions placid, in others wild and rapid, winding along the deflection barrier of the Hoosic Hills, offers facilities for the use of its water-power. The Merrimac, the second stream of the state in volume, runs in a charming valley through the extreme north-east corner, and affords immensely valuable water-power at Lowell, Lawrence, and Haverhill.

South of Cohasset the shore is sandy, with a few isolated rocky ledges and boulders. About Boston, and to the north of it, the shore is rocky and picturesque. Cape Cod, like a human arm reaching from the mainland up to the Atlantic, forms from the elbow to hand, is now more than a few miles broad. It is a sandy ridge, dotted with summer resorts and cottages. Cape Ann has a rugged interior and a ragged, rocky coast. It, too, is a summer resort, with some fishing ports. Boston Harbor (originally known as Massachusetts Bay, a name which now has a much broader signification) is the finest roadstead on the coast. The eastern hook of the Cape Cod Peninsula forms Provincetown, which is an excellent anchorage with a port of refuge for vessels approaching Boston. Salem Harbor is the most considerable other haven on Massachusetts Bay; on Buzzard's Bay New Bedford has a good harbour, and on the Atlantic coast are Vincennes, New London, New Haven and New York, frequented by summer residents. Gloucester has the largest fishery interests of any place in the country, and is one of the chief fishing ports of the world. Buzzard's Bay is also a popular yachting ground. About Cape Cod the original Indian summer predominates. Wood's Hole is a station of the United States Bureau of Fisheries, and a marine biological laboratory is there.

The principal islands lie off the south coast. The largest is Martha's Vineyard, known as the "Island of Eden," and a favorite summer resort, and includes about 3$\frac{1}{2}$ sq. miles. It has in Vineyard Haven (Humbolt's Hole) a spacious harbour, much frequented by wind-bound vessels seeking a passage round Cape Cod. The island is covered with stunted trees, shrubs and heaths, and inhabited by the curious" hens. Brant Point in the north-east is the most elegant point. Cape Cod, lying off the eastern extreme, has a pleasant coast-line and a small inland hill and pond region. The south-west corner is a lowland, but its climate has made it a popular summer resort, Oak Bluffs being one of the chief resorts of the Atlantic coast. Farther east, Nantucket, a smaller island of triangular shape, is likewise the home of a seafaring folk who still retain in some degree their primitive habits, though summer visitors are more and more affecting its life.

Flora and Fauna.—Massachusetts lies entirely in the humid area of the Transition Zone between the extreme north-western corner of the state, which lies in the Subarctic Zone. Thus the original native trees and plants were those common to New England and northern New York. The presence of a dense population has driven some of these out into others, including some more hardy and better game plants. The larger wild animals are excepting an occasional black bear or deer. Of the smaller fur-bearing animals, the beaver was long ago exterminated, the otter is seen very rarely, and the mink only in the most isolated districts; rabbits and foxes are common, and skunks and woodchucks are exceedingly rare. Squirrels are not uncommon. Copperhead snakes and rattlesnakes are occasionally seen, and there are several species of harmless serpents. Of game birds the most characteristic is the partridge (arctic), which is found in every part of the state, and the woodcock are not uncommon in favourable localities, and several species of ducks are found especially in the bays and marshes near the coast during the seasons of migration. A stray eagle is often seen, but is not common. The eagle and the partridge are the only birds capable of carrying a message; the carrier pigeon is not found. Most of the common wild flowers are found on the plains and in the country, and the flora of the interior is that of the highlands. The woods are rich in timber, and many kinds of birds are found. Of these the wild turkey, the woodcock, the Wilson's thrush, the brown thrasher, the bobolink, the catbird, the oven bird, and the meadow lark are common, and the vesper sparrow, the white-throated sparrow (Peabody bird), the goldfinch and the robin. Brook trout are found, especially in the streams in the western part of the state, and bass, pickerel, perch and smaller fish in the rivers. The state fish is the brook trout. Certain birds are abundant on the coast that the cod is sometimes used as an emblem of the state; thus a figure of one hangs in the representatives' chamber at the State House. The artificial propagation and preservation of the Cod and of other marine species has been successfully carried on under the supervision of a state commission. The commonwealth has expended large sums since 1890 in a vain attempt to exterminate the gypsy moth (Oeciera, or more exactly Ponthetia, dixp), accidentally allowed to escape in 1869 by a French naturalist.

Climate.—The climate is mild, showing great extremes of temperature (20° F. below zero to 100° above) and marked local variations. The south-eastern coast and islands are mildest. The mean average
temperature of Boston is 48° F. In the interior it is slightly lower. The mean summer temperature generally over the state is about 70° F. Changes are often sudden, and the passage from winter to summer is through a rapid spring. The ocean tempers the climate and gives a coolness which is greatly appreciated. But in the west, steamtugs plying constantly now prevent the occurrence of such obstruction. In the elevated region in the west the winters are decidedly severe, and the springs and summers often late. Western Massachusetts has the mildest climate, and especially in the Berkshires a cool, pure and elastic atmosphere prevails, relatively dry, and altogether delightful.

Agriculture.—The soil, except in some of the valleys, is not naturally well adapted to agriculture. Still, the sandy wastes are common in the south-east parts. High cultivation, however, has produced valuable market-gardens about Boston and the larger towns; and industry has made tillage remunerative in most other parts. The gross value of agriculture in 1905 was not greatly compared with that of other industries, but they are of great importance in the economy of the state. The total value of farm property in 1900 was $182,646,704, including livestock valued at $15,795,464. Of the increase in the total value of farm property between 1890 and 1905, one half was in the decade 1890-1900; this increase being due partly to the rising value of suburban realty, but also to a development of intensive farming that has been very marked since 1880. The total value of farms in 1905 was in $1,436,000,000 (including $243,328). The value of the marble produced in the same year was $212,438, the state ranking fifth in the value of the total product and fourth in building-marble. Other minerals are vegetable, such as leaf, hay and tobacco. The total value of state ranked fifth in 1900 in the value of stone quarried ($1,333,000), and $1,406 (of which $950,921 was the value of common brick). There are many mineral springs in the state, more than half being in Essex and Middlesex counties. The total amount of mineral waters produced in 1900 was valued at $45,405, the principal mineral water produced the state was $5,662,049. Gold has been found in small quantities in Middlesex, Norfolk, and Plymouth counties.

The granite of the four states of the Union is smaller than the other three. In 1905 the value of manufactured products (six exceeding it in population); and this despite very scant native resources of raw materials and a very limited home market.
Haverhill, Marlboro and Boston, in the order named, being the principal centres. The third industry in 1805 was that of foundry and machine-shop products ($58,508,793), of which Boston and Worcester are the principal centres. Lesser interests, in the order of importance, were the preparation of felt, rubber goods ($53,133,020), tanned, curried and finished leather ($33,352,990), in the manufacture of which Massachusetts ranked second among the states; paper and wood pulp (32,012,247), in the manufacture of which Massachusetts ranked third among the states of the Union; slaughtering and meat packing ($30,832,532); printing and publishing ($33,900,748), of which $21,020,237 was the value of newspapers and periodicals; clothing ($21,724,056); electrical machinery, apparatus and supplies ($15,852,210); lumber ($12,653,396), the value in 1814 being $7,025,249; and pottery ($11,047,731; less than in 1800); cordage and twine ($11,173,251), in the manufacture of which Massachusetts was second only to New York; furniture ($1,092,581); malt liquors ($1,080,844); jewelry ($1,070,844); and foods ($9,317,996), in which Massachusetts was third among the states.

Many of these industries have a history going back far into colonial times, some even dating from the days of the Pilgrims. Textile products were really varied and of considerable importance before 1700. The policy of the British government towards such industries in the colonial period was in general repressive. The non-importation sentiment of adhering to the War of Independence fostered homestead manufactures considerably, and the Embargo and Non-Intercourse Acts before the war of 1812, as well as that war itself (despite the subsequent glut of British goods) had a much greater influence on the growth of the factory system, which by 1830 was firmly established in the textile manufacturing regions, than on the manufacturing of less important products, which was rapidly transforming other industries. Improvements were introduced much more slowly than in England, the cost of cotton machinery as late as 1826 being 50-60% greater in America. The first steam engine in Boston was not installed until 1812. Carding, roving and spinning machines were constructed, at Bridgewater in 1786. The first cotton mill had been established in Beverly in 1788, and the first real woolen factory at Byfield in 1791. The manufacture of leather was also fostered to a great extent. The industry was devised by Amos Whittomore (1759-1828) in 1797; spinning jennies were in operation under water-power before 1818. Carding, roving and spinning machines were constructed, at Bridgewater in 1786. The first cotton mill had been established in Beverly in 1788, and the first real woolen factory at Byfield in 1791. The manufacture of leather was also fostered to a great extent. The industry was devised by Amos Whittomore (1759-1828) in 1797; spinning jennies were in operation under water-power before 1818. Carpet-weaving was begun at Worcester in 1804. Not a yard of fabric was woven in New England prior to 1780, but by 1814 any country till done by William Crompton at the Middlesex Mills, Lowell, in 1804” (Samuel Lawrence). The introduction of the remarkably complete machinery of the shoe industry was practically contemporaneous with the growth of the other great industrial centers under the dominance of manufacture. At Pittsfield and at Dalton at Holyoke and South Hadley being the greatest producers. Vulcanized rubber is a Massachusetts invention. Most of the imitation campaign was done in the United States is produced at Attleboro and North Attleboro, and in Southbridge, and in New Haven, Conn. The industry produced 16.4% of all the manufactures of the state, and Lynn, the second city, which had been first in 1800, 14.9% Some industries which have since become dead or of relatively slight magnitude have at one time of much greater significance, economically or socially: such as the rum-distilling connected with the slave trade, and various interests concerned with shipbuilding and navigation. The packing of pork and beef formerly centred in Boston; but, while the volume of this business has been greatly diminished, it has been greatly exceeded in the west. For many years Massachusetts controlled a vast lumber trade, drawing upon the forests of Maine, but the growth of the west changed the old channels of trade and diminished the influence of New England on the western timber. It was between 1840 and 1850 that the cotton manufactories of Massachusetts began to assume large proportions; and about the same time the manufacture of boots and shoes centred there. New Bedford was quickly famed, and a century later was famous shortly after the beginning of the 19th century, and by 1845 that town employed one quarter of all the shipwrights in the state. Fishing is an important industry. Drift whales were utilized in the early years of the colony, and shore booting for the balance (or “right”) was profitable. In the early years of the 19th century oil—was an industry already regulated by various towns before 1650; but the pursuit of the sperm whale did not begin until about 1813. The former industry had died out before the War of Independence. The latter is not yet out, according to a communication with western lines. It cost about $20,000,000, the state lending its credit, and was built between 1855 and 1874. The inter-urban electric railways are of very great importance in the state; in 1908 the total mileage of street and inter-urban electric

1 In 1905 Massachusetts produced 60.7% of the writing paper manufactured in the country. Besides paper, book and building paper are made in the state, but very little newspaper. 2 It must be noted, however, that the first successful construction of cards, drawing and roving, and of spindles, on the Arkwright principle was by S. Slater at Pawtucket, Rhode Island in 1790.

The manufacturing of paper has increased 691.7% since 1905, and that of rubber goods 166.8%.
railways was 2,841-59 m. (223-85 m. being first main track). The Cape Cod canal, 12 m. long, from Sandwich on Barnstable Bay to Buzzard's Bay, was begun in June 1909, with a view to shortening the distance by water from Boston to New York and eliminating the danger of the voyage round Cape Cod.

**Population.**—The population of the state in 1910 was 3,366,116, the increases in successive decades after 1790 being respectively 11-6, 11-6, 10-9, 16-0, 20-9, 34-8, 23-8, 18-4, 22-4, 25-6, 25-3 and 20-1. With the exception of Rhode Island, it is the most densely populated state in the Union, the average number to the square mile in 1900 being 349 (in Cape Cod, 88), and the native population, i.e., the population of places having above 8,000 or more inhabitants, being 69-9% in 1890 and in 1900 70-6% of the total population (in places above 2,000, 91-5%: in places above 25,000, 58-3%). The female population is greater (and has been since 1765, at least) than the male, the percentage being in 1900 greater than in any other state of the Union (51-3%; District of Columbia, owing to clerks in government service 52-6%). In 1900 less than 1-3% of the population was coloured; 30-2% were foreign-born (this element having almost continuously risen from 16-49% in 1855, and 62-3% of all inhabitants and 46-5% of those native-born had one or both parents of foreign birth. Ireland contributed the largest proportion of the foreign-born (29-7%), although since 1875 the proportion of Irish in the total population has considerably fallen. After the Irish the leading foreign elements are Canadian English (18-7%), Canadian French (15-8%) and English (9-7%), these four constituting three-fourths of the foreign-born. Since 1885 the natives of southern Europe have become visible. Of the increase in total population from 1835-1853 only a third could be attributed to the excess of births over deaths; two-thirds being due to immigration from other states or from abroad. Boston is the second immigrant port of the country. A large part of the transatlantic immigrants pass speedily to permanent homes in the west, but by far the greater part of the Canadian influx remains.

According to the census of 1910 there were 32 incorporated cities in Massachusetts, of which 6 had between 12,000 and 20,000 inhabitants; 11 between 20,000 and 25,000 (Gloucester, Medford and North Adams); 12 between 25,000 and 50,000 (Malden, Haverhill, Salem, Newton, Fitchburg, Taunton, Everett, Quincy, Pittsfield, Lynn, Springfield, Lawrence, Somerville, Holyoke, Brockton); and 5 more than 100,000 (Boston, 670,585; Worcester, 145,986; Fall River, 119,295; Lowell, 106,294; Cambridge, 104,839).

The death rates in the decades 1820-1829 were 29-5, 25-3, 26-0, 27-6, 24-2, 25-0, 25-8, 27-6, 27-0 and 24-2 per 1,000; and the death-rates 17-7, 20-7, 18-2, 20-8, 18-8, 19-8, 19-4, 18-0 and 16-4. Pneumonia and consumption, approximately of equal fatality (15-4 and 15-7 each), exced more than two-thirds of all deaths; the diseases of next lower fatality, cancer and cholera infantum.

Of males (1,097,581) engaged in 1900 in gainful occupations 47-1% were engaged in manufacturing and mechanical pursuits (77-9 in every 100 in 1870 and 73 in 1900), 27-1 in trade and transportation, 14-2 in domestic and personal service, 7-4 in agricultural pursuits and 4-2 in professional service. The corresponding percentages for females (1,169,467) were 46-4 in manufacturing (in 1890, 52%), 30-3 in professional service (in 1890, 35%), 26-1 in transportation (in 1890, 20%) and 7-1 in professional service and 6-0 in agriculture. Formerly farmers' daughters of native stock were much employed in factories; but since operatives of foreign birth or parentage have in great part taken their places, they have sought other occupations, largely in the manufacture of small wares in the cities, and particularly in departments of trade where skilled labour is essential. Household service is seldom now done, as it formerly was, by women of native stock.

The federal census of 1890 showed that 45-7% of the adult males and females, of employed for gain only 37-5% were of native descent (that is, had a native-born father). Natives heavily predominated in agriculture and the professions, slightly in trade, and held barely more than half of all gainfully occupied positions; but in transportation, personal service, manufactures, labour and domestic service, the predominance of the foreign element was asserted by the census of the state Bureau of Statistics of Labour that the strong industrial condition of the state is largely due to the absence of four million foreigners, who is what is called the 'native stock,' but by that of the immigrants. After the original and exclusively English immigration from 1620 to 1840 there was nothing like regular foreign immigration until the 10th century; and it was a favorite assertion of Dr Faller, the historian of the fisheries of the state, that there has been a steady English immigration through two centuries and the population of the state.

With foreign immigration the strength of the Roman Catholic Church has greatly increased: in 1866 of every 1000 of estimated population 355 were members of the Roman Catholic Church (a proportion exceeded only in New Mexico and in Rhode Island; 310 was the number per 1000 in Louisiana), and only 148 were communicants of the Protestant sects. In 1890 the Roman Catholics (out of a total of 1,626,621 communicants of all denominations), 119,196 Congregationalists, 80,894 Baptists, 65,498 Methodists and 51,636 Protestant Episcopalians.

Boston has been termed the "abandoned farm" in Massachusetts. The desertion of farms was an inevitable result of the opening of the great agricultural regions of the west, but it is by no means characteristic of Massachusetts alone. The Berkshire district affords an excellent example of the result of a flow of population from the state. In 1830 there were 6,606 families in the county; by 1860 there were 13,139, and the poor population increased six and a half times in the century, the upland diminished by an eighth. Socially and educationally the upland has furnished an interesting example of development. Since 1865 (at least) various parts of Cape Cod have shrunk greatly in population, agriculture and manufactures, and even in fishing interests; this reconstruction of industrial and social interests being, apparently, simply part of the general urban movement—a movement toward better opportunities through the removal of urban populations into the existing towns and cities. Cape Cod remains as a highly industrial and manufacturing community is largely due to foreign immigrants—especially British Americans and Portuguese from the Azores; although the population remains, to a degree exceptional in northern states, of native stock.

**Government.**—Representative government goes back to 1634, and the bicameral legislature to 1644. The constitution of 1788, which still endures (the only remaining state constitution of the 18th century), was framed in the main by Samuel Adams and as an embodiment of colonial experience and revolutionary principles, and as a model of constitution-making in the early years of independence, is of very great historical interest. It has been amended with considerable freedom (37 amendments up to 1907), but with more conservatism than has often prevailed in the constitutional reform of other states; so that the constitution of Massachusetts is not so completely in harmony with modern democratic sentiment as are the public opinion and statute law of the state. The commonwealth, for example, is still denominated "sovereign," and education is not declared a constitutional duty of the commonwealth. One unique feature is the duty of the supreme court to give legal advice, on request, to the governor and council. Another almost equally exceptional feature is the persistence of the colonial executive council, consisting of members chosen to represent divisions of the state, who assist the governor in his executive functions. Massachusetts is also one of the few states in which the legislature meets in an annual session.

The constitution of 1788 created an executive department consisting of a governor, a lieutenant-governor and a general court, whose judicial, law-making and revenue-making powers are invested in it. Religious qualifications for suffrage and office-holding were somewhat relaxed, except in the case of

1 The population of the state was 378,787 in 1790; 422,845 in 1800; 472,040 in 1810; 523,287 in 1820; 610,408 in 1830; 737,690 in 1840; 994,514 in 1850; 1,231,666 in 1860; 1,437,581 in 1870; 1,738,885 in 1880; 2,335,463 in 1890; and 2,805,446 in 1900. In 1890, according to the state census, the population was 3,003,680, or about 77-7% more than in 1800.

2 In 1910 the following townships each had populations of more than 100,000: Revere, Lawrence, Brockton, Attleboro, Peabody, Hyde Park.

3 The birth-rates every fifth (census) year up to 1895 varied for natives from 14-48 to 19-49; for foreigners from 45-87 to 66-68. The death-rates for natives from 18-6 to 21-0, for foreigners from 19-8, 15-6, 18-6, 18-6, 18-6, 17-4 and 17-4; the ratio of marriages to the marriageable population was for males (above 16 years) 61-5, for females (above 14) 46-0; the fecundity of marriages seemed to have increased, being about twice as high for foreigners as for natives. See Annual Report of the Board of Health (1896), by S. W. Abbott; and Sixtieth-fourth Report of Births, Marriages and Deaths in Massachusetts (1906).
Roman Catholics, after 1691. Real toleration in public opinion grew slowly through the 18th century, removing the religious tests from office, and a constitutional amendment in 1821 explicitly forbade such tests in the case of office-holders. Property qualifications for the suffrage and for office-holding—universal through colonial times—were abolished in the main in 1780. From 1821 to 1861 the payment of at least a poll-tax was a condition precedent to the exercise of the suffrage. An educational test (dating from 1857) is exacted for the privilege of voting, every voter being required to be able to read the Constitution of the Commonwealth in the English language, and to write his name. The property qualification of the governor was not abolished until 1852. In the presidential election of 1860, when an unprecedentedly large vote was cast, the number of voters registered was nearly 20% of the population, and of these nearly 85% actually voted. Massachusetts is one of the only two states in the Union in which elections for state officers are held annually. In 1888 an act was passed providing for the use in state elections of a blanket ballot, on which all the names of all candidates for each office are arranged alphabetically under the heading of that office, and there is no arrangement in party columns. This was the first state law of the kind in the country. The same method of voting has been adopted in about two-thirds of the townships of the state. A limited suffrage was conferred upon women in 1870. Every female citizen having the qualifications of a male voter may vote in the city and town elections for members of the school committee.

A household with a family may, by recording the proper declaration in a registry of deeds, hold exempt from attachment, levy on execution or distraint, any payment of penalty, and to make a contract for an estate of homestead, not exceeding $800 in value, in a farm or lot with buildings thereon which he lawfully possesses by lease or otherwise and occupies as his residence. The exemption does not extend to the household's obligations for sale of his lands, or for the value of the householder's buildings on land which he has leased those buildings are not exempt from sale or levy for the ground rent. If the householder has a wife he can mortgage or convey his estate of homestead only with her consent, and if the householder has the care of minor children the homestead exemption survives until the youngest child is twenty-one years of age, or until the death or marriage of the widow, provided the widow or a child continues to occupy it.

The scope of state activity has become somewhat remarkable. In addition to the usual state boards of education (1837), agriculture (1852), railroad commissioners (1869), health (1869), statistics of labor, food, and game, dairy health department, bureau of industry (1895), railroads, highways, insurance and banking commissions, there are also commissions on ballot-law, voting machines, civil service, (1881), uniformity of legislation, gas and electric lighting corporations, consolidation and amalgamation of labor-disputes, etc. Conciliatory methods were started by the efficient state boards of registration in pharmacy, dentistry, and medicine. Foods and drugs have been inspected since 1882. In general it may be said that the excellence of administrative results is noteworthy. The work of the widow and minor children of the homestead estate has been recognized. All state employees are under civil service rules. The operation of the city of Boston, and of the clerical, stenographic, prison, police, civil engineering, fire, labour, foreman, inspection and bridge tender services of all cities, and under a law (1894) by which cities and towns may petition the legislature for the adoption of the municipal civil service, are under a law (1894) by which cities and towns may petition the legislature for the adoption of the municipal civil service. The development of a magnificent park system of woods, fells, river-banks and seashore, unrivalled elsewhere in the country. The commonwealth joined the city of Boston in the construction of a subway beneath the most congested portion of the city for the passage of electric cars. For the better accommodation of the increasing commerce of the port of Boston, the commonwealth bought a considerable frontage upon the harbour lines and constructed a dock capable of receiving the largest ships. It also provided the work of the United States government in deepening the approaches to the wharves. It has secured as public reservations the summit and sides of Greylock (3535 ft.) in the north-west corner of the state, and of Washington (3560 ft.) in the south-west corner. In 1885 the legislature has been increased in the abolition of grade.
MASSACHUSETTS

crossings of railways and highways, and in 1894 the commonwealth began the construction and maintenance of state highways.

Since 1855, in Boston, and since 1894, in Fall River, the administration of the city police departments, including the granting of liquor licenses for the sale of alcoholic beverages, was taken over by the local police (the police commissioner in Boston, a board in Fall River) appointed by the governor. But though in each case the result has been an improved administration, it has been generally conceded that only most exceptionally able men can hold such offices, and that the self-government, and later attempts to extend the practice have failed. The referendum has been sparingly used in matters of local concern. Beginning in 1892 various townships and cities, numbering 18 in all, adopted municipal corporations and appointed municipal councils. The gasworks have been notably more successful than the electric plants.

In Massachusetts, as in New England generally, the word "town" is used, officially and colloquially, to designate a township and during the Connecticut period New England towns were usually "towns." The term "town" is subject to various interpretations. The word "town" is in use in Massachusetts in three distinct senses: (1) governmental; (2) territorial; and (3) historical.

1. The usual allotment of the cost of this work is as follows: 65% by the county, 25% by the commonwealth, and 10% by the municipality in which the crossing is located.

2. The cost was apportioned between the commonwealth and the local government in the proportion of 3 to 1.

3. In Massachusetts, townships are called "towns," until 1822, when it had a population of some 47,000. The government of Brookline (pop. in 1895, 23,436) is an interesting example of the adaptation of the township system to urban conditions. The town is in many respects referred to as a residential suburb, its business area is large, its schools are efficient, and, among other things, it has established a town gymnasium. The town hall is not large enough for an assembly of all the voters, but actually the attendance at the annual town-meeting has been in force a kind of referendum, under which any measure passed by a town-meeting attended by 700 or more voters may be referred, upon petition of 100 legal voters, to a regular vote at the polls. The work of the town-meetings is done through special committees.

public officers, and such minor officials as inspectors of milk, inspectors of buildings, gaugers of measures, and keepers of stoves and hoops, forest warden and forester.

A school committee consisting of any number of members divisible by three is chosen, one-third each year, at the annual town-meeting or special town-meeting, held in the same month. Any "town" having a village or district within its limits that contains 1000 inhabitants or more may authorize that village or district to establish a separate organization for lighting its streets. The police, the watchman or policeman, of the officers of such organization to include at least a prudential committee and a clerk. All laws relative to towns are applied to "cities" in so far as they are not inconsistent with general or special laws relative to the latter, and the powers of the selectmen are vested in the mayor and alderman.

Education.—For cities of above 8000 inhabitants (for which alone comparative statistics are annually available), in 1906 the ratio of average days' attendance of each pupil enrolled, and the value of school property per capita of pupils in average attendance were higher than in any other state; the average length of the school term was slightly exceeded in eight states; and the total cost of the schools per capita of pupils in average attendance ($39.53) was exceeded in six other states. In 1905-1906 the percentage of average attendance in the public schools to the number of children (between 5 and 15 years) in the state was 82; in Barnstable county it was 95, and in Plymouth 97; and the lowest rate of any county was 68, that of Bristol. In the same year the amount of the various school taxes and other contributions was $30.53 for each child in the average membership of the public schools, and the highest amount for each child in any county was $35.77 in Suffolk county, and in any township or city $68.01—in Lincoln. The school system is not one of marked state centralization—as contrasted, e.g., with New York. A state board of education has general control, its secretary acting as superintendent of the state system in conjunction with local superintendents and committees. Women are eligible for these positions, and among the teachers in the schools they are greatly in excess over men (more than 10 to 1), especially in lower grades. No recognition exists in the schools of race, colour or religion. The proportion of the child population that attends schools is equalled in but two or three states east of the Mississippi river. The services of Horace Mann (q.v.) as secretary of the state board (1837-1848) were productive of almost revolutionary benefits not only to Massachusetts but to the entire country. His reforms, which reached every part of the school system, were fortunately introduced just at the beginning of railway and city growth. Since 1850 truant and compulsory attendance laws (the first compulsory education law was passed in 1842) have been enforced in conjunction with laws against child labour. In 1900 the average period of schooling per inhabitant for the United States was 4.3 years, for Massachusetts 5.9 years. (The same year the ratio of wealth productivity was as 66 to 37.) Massachusetts stands "foremost in the Union in the universality of its provision for secondary education." The laws practically offer such education free to every child of the commonwealth. Iliterate persons not less than ten years of age constituted in 1900 5.9% of the population; and 0.8, 14.6, 10.7% respectively of native whites, foreign-born whites and negroes. More patents are issued, relatively, to citizens of Massachusetts than to those of any other state except Connecticut. Post office statistics indicate a similarly high average of intelligence.

The public school system includes common, high and normal schools, and various evening, industrial and training schools. Many training schools and normal schools were evening schools in 1894 manual training movement was especially popular as a way of training girls who would have to earn a living, having 20,000 students. There are also many private business colleges, academic schools and college-preparatory schools. The high schools enjoy an exceptional reputation. An unusual proportion of them are in the suburbs and serve a population of students. The large schools of the United

E. G. Brown, in Monographs on Education in the United States prepared for the Paris Exposition of 1900 and edited by N. M. Butler.
These two schools were removed subsequently to Framingham (1835) and Westfield (1844), where they are still active; while others flourish at Bridgewater (1840), Salem (1854), Worcester (1874), Fitchburg (1895), North Adams (1877), Hyannis (1877) and Lowell (1884). There is also a state normal art school at Boston (1873) for both sexes.

The commonwealth contributes to the support of textile schools in cities in which 450,000 spindles are in operation. Such schools exist (1909) in Lowell, Fall River and New Bedford. The commonwealth also maintains aboard a national ship a nautical training school (1891) for instruction in the science and practice of navigation. During the Spanish-American War of 1898 and the subsequent naval operations, a fair proportion of the graduates and cadets of the school enlisted in the United States service.

There are several hundred private schools, whose pupils constitute nearly 10% of the total school-enrollment of the state. Of higher academies and college-preparatory schools there are scores. Among those for boys Phillips Academy, at Andover; the Groton school, and the Mount Hermon school are well-known examples, and the girls' largest school is the Northfield Seminary at East Northfield. In Boston and in the towns in its environs are various famous schools, among them the boys' classical school in Boston, founded in 1635, one of the oldest secondary schools in the country. The leading educational institution of the state, as it is the oldest and most famous of the country, is Harvard University (founded 1636) at Cambridge. In the extreme north-west of the state, at Williamstown, is Williams College (1793), and in the Connecticut Valley is Dartmouth College (1769) at Hanover, New Hampshire. Boston University (Methodist Episcopal, 1867); Tufts College (1852), a few miles from Boston in Medford, originally a Universalist school; Clark University (1886) devoted wholly to graduate instruction in the sciences and the humanities; Boston Normal Institute (1839) and the normal schools at Charlestown, East Boston, and Salem, all in Boston, are important institutions. Two Roman Catholic schools are maintained—Boston College (1863) and the College of the Holy Cross (1843) at Worcester. Of various institutions for the education of native Indians in the state are the Indian Boarding School (1875) at Bluffton, the Mount Lebanon School (1875) at Wellesley, and the Wrentham (1875) at Wrentham. There are several other schools, which are maintained by the United States government, for the education of Indians.

For agriculture students the state supports a school at Amherst (1867) and Harvard University the Bussey Institution. In technological education is the Massachusetts Institute of Technology (1861), with branches in the United States, and the Massachusetts Institute of Technology (opened in 1865). There are schools of theology at Cambridge (Protestant Episcopal), Newton (Baptist) and Waltham (New Church), as well as in connexion with Boston University (Methodist), Tufts College (Universalist) and Harvard (non-sectarian, and the affiliated Congregational Andover Theological Seminary at Andover) and the Sunday school movement is conducted.

The state maintains medical schools in Boston and Harvard universities.

Public Institutions.—Massachusetts was in 1903, in proportion to the population, more richly provided with public collections of books than any other state: in that year she had nearly a seventh of all books in public, society and school libraries in the country, and a much larger supply of books per capita (2·50) than any other state. The rate for New York, the only state having a larger number of books in such libraries, being only 1·19. The Boston public library, exceeded in size in the United States by the library of Congress at Washington—and probably first, because of the large number of duplicates in the library of Congress—was more than double the library of Harvard, extremely well stocked and of great value for research; the collections of the Massachusetts Historical Society (1791); the Boston Athenaeum (1807); the State Library (1826); the New England Historical Genealogical Society (1845); the Congregational Church; the American Academy of Arts and Sciences (1780); and the Boston Society of Natural History (1830), all in Boston, leave it easily unrivalled, unless by Washington, as the best research centre of the country. The collections of the American Antiquarian Society (1812) at Worcester are also notable. Massachusetts led, about 1850, in the founding of town and city libraries supported by public taxes, and by 1880 had established more of such institutions than existed in all other states combined. In 1900 out of 533 towns and cities
only five, representing less than half of 1%, were without free library facilities, and three of these five had association libraries charging only a small fee.

The state is very well supplied with charitable and reformatory institutions, in which noteworthy methods have been employed with success. The state institutions, each governed by a board of trustees, and all under the supervision of the state board of revising, consist of: Attleborough Training School (1866); a state farm at Bridgewater (1867) for paupers and petty criminals; the Lyman school for boys at Westboro, a reformatory for male criminals under fifteen years of age sentenced to imprisonment for not more than five years; the Male and Female Reformatory for the young boys at Berlin; an industrial school for girls at Lancaster, also a reformatory school—a third reformatory school for boys was opened in 1909; a state sanatorium at Rutland for the insane and for women and girls; a state hospital at Framingham (1895), and a hospital school at Canton for the care and instruction of crippled and deformed children. Three more hospitals for consumptives were opened in 1909. Under the supervision of the state board of insurrection, each under the government of a board of seven trustees (of whom two are women) are state hospitals for the insane (at Worcester (1833), Taunton, Northampton, Danvers, Westport and Medford, a state colony for the insane at Gardner, a state hospital for epileptics at Palmer, a state school for the feeble-minded at Waltham (governed by six trustees), a state school at Wrentham, state "hospital cottages for children" (1882) at Baldwinville (governed by five trustees), and the Foxboro state hospital for incurables. The state maintains twenty hospitals, some of which are used for the insane at Waverley, Barre, Wrentham and Baldwinville, and nineteen small private institutions, all under the supervision of the state board of insanity. Under the supervision of a board of trustees, and some of which are used for the insane at Waverley, Barre, Wrentham and Baldwinville, and nineteen small private institutions, all under the supervision of the state board of insanity. Under the supervision of a board of trustees, and some of which are used for the insane at Waverley, Barre, Wrentham and Baldwinville, and nineteen small private institutions, all under the supervision of the state board of insanity. Under the supervision of a board of trustees, and some of which are used for the insane at Waverley, Barre, Wrentham and Baldwinville, and nineteen small private institutions, all under the supervision of the state board of insanity. Under the supervision of a board of trustees, and some of which are used for the insane at Waverley, Barre, Wrentham and Baldwinville, and nineteen small private institutions, all under the supervision of the state board of insanity. In 1900 out of 533 towns and cities

This is an especially honourable distinction, for William T. Harris has said that "the history of education since the time of Horace Mann is very largely an account of the successive modifications introduced into elementary schools through the direct or indirect influence of the normal school."
methods are used for the taxation of banks, insurance companies, railways, tramways, trust companies and corporations, some of them noteworthy. In the case of corporations realty and machinery are taxed generally by the local authorities, and stock values by the department of public instruction. The Boston stock exchange is the second of the country in the extent of the securities in which it deals. The proportion of holders of U.S. bonds among the total population is higher than that in any other state.

History.—It is possible that the coasts of Massachusetts were visited by the Northmen, and by the earliest navigators who followed Cabot, but this is only conjecture. In 1602 Bartholomew Gosnold landed at and named Cape Cod and coasted as far south as the present No-Man's Land, which he named Martin's or Martha's Vineyard, a name later transferred to a large island off the coast. Plymouth and Champlain at a later date coasted along what is now Massachusetts, but the map of Champlain is hardly recognizable. The first such expeditions for cartographical record were made by John Smith in 1614, and his map was long the basis, particularly in its nomenclature, of later maps. Permanency of occupation, however, dates from the voyage of the "Mayflower," which brought about a hundred men, women and children who had mostly belonged to an English sect of Separatists, originating in Yorkshire, but who had passed a period of exile for religion's sake in Holland. In the early winter of 1620 they made the coast of Cape Cod; they had intended to make their landing farther south, within the jurisdiction of the Virginia Company, which had granted them a patent; but stress of weather prevented their doing so. Finding themselves without warrant in a region beyond their patent, and three of the directors of the joint-stock company (probably all servants or men of the "lesser sort") unless concessions were made to these, they drew up and signed before landing a democratic compact of government which is accounted the earliest written constitution in history. After some exploration of the coast they made a permanent landing on the 21st of December 1620 (N.S.) at Plymouth, a harbour which had already been so named by John Smith in his maps of 1614 and 1616. During the first winter nearly one-half their number died from exposure, and the relations of the survivors with their partners of the London Company, who had insisted that for seven years the plantation should be managed as a joint stock company, were unsatisfactory. However, during the spring of 1621 Plymouth became a corporate colony with its chief authority vested in the body of freemen convened in the General Court. This was characteristic of the colony's early history. The charter gave the company control over the admission of "free men" (co-partners in the enterprise, and voters), "full and absolute power and authority to correct, punish and rule" subjects settling in the territory comprised in their grant, and power to "resist...by all fitting ways and means whatever" all persons attempting the "destruction, invasion, detriment or annoyance" of the plantation. Some writers deny the company's right under this instrument to rule as they proceeded to do; but at any rate what they did was to make the suffrage dependent on stringent religious tests, and to repress with determined zeal all "vagaries" and "whimsies." Criticism of church or magistrates was not tolerated. Laws were modelled closely on the Bible. The clergy were a ruling class. The government was frankly theocratic. Said Winthrop (1637): "We see not that any should have authority to set up any other exercises besides what authority hath already set up"; and a synod at Cambridge in 1637 catalogued eighty-two "opinions, some blasphemous, others erroneous and all useless," besides nine "unwholesome expressions," all of which were consigned "to the devil of hell from whence they came." Another synod at Cambridge in 1647 more formally established the principle of state control. The legislation against Baptists (about 1644-1678) and the persecution of the Quakers (especially 1656-1662) partook of the brutality of the time, including scourging, boring of tongues, cutting of ears and in rare cases capital punishment. It cannot be denied that men like Roger Williams and some of the persecuted Quakers, though undeniably contentious and aggressive in their conscientious dissent, showed a spirit which to-day we should prize in tolerance and humanity, but not of the Puritan sort. And it seems necessary to emphasize these facts because until about 1870 it was almost unchallenged tradition to regard the men of Massachusetts Bay as seekers and champions of "religious liberty." They left England, indeed, for liberty to discard the "paperies" of the English Church, and once in Massachusetts they even discarded far more than those of

The colony. When it had become known that the colony was within the territory of the New England Council, John Pierce, in 1621, procured from that body a grant which made the colonists its tenants. A year later Pierce surrendered this and procured another, which in effect made him proprietor of the colony, but he was twice shipwrecked and was forced to assign to the adventurers his second patent. In 1629 Governor Bradford procured from the same council a definite grant of the tract which corresponds to the south-eastern portion of the present state. But all attempts to procure a royal charter for Plymouth Colony were unsuccessful, and in 1601 it was annexed to the Colony of Massachusetts Bay under what is termed the Provincial Charter.

King James having by patent in 1620 created a Council for New England to whom he made a large grant of territory, the council in 1628 made a sub-grant, confirmed by a royal charter that passed the seals on the 4th of March 1629, to the "Governor and Company of the Massachusetts Bay in New England." There were a few minor expeditions during the few years since Smith was on the coast before this company, in the Puritan interests, had sent over John Endecott with a party in 1628 to what is now Salem. In 1630 the government of the company, with questionable right (for the charter seems evidently to have contemplated the residence of the company in England), transferred it to themselves, and under the leadership of John Winthrop laid the foundations anew of the Massachusetts colony, when they first settled Boston in the autumn of that year. Winthrop served repeatedly, though not continuously, as governor of the colony till his death in 1649, his rejection in 1636 being due to a party of theological revolt which chose Henry Vane (afterwards Sir Henry) to the office. This was an incident in a famous episode, important rather as a symptom than in itself, namely, the Antinomian controversy, "New England's earliest protest against formulas," in which Vane and Ann Hutchinson took the lead in criticizing the official orthodoxy of the colony. The magistrates thereupon contently asserted themselves to the discomfiture of their critics (Ann Hutchinson being banished), and this was characteristic of the colony's early history. The charter gave the company control over the admission of "free men" (co-partners in the enterprise, and voters), "full and absolute power and authority to correct, punish and rule" subjects settling in the territory comprised in their grant, and power to "resist...by all fitting ways and means whatever" all persons attempting the "destruction, invasion, detriment or annoyance" of the plantation. Some writers deny the company's right under this instrument to rule as they proceeded to do; but at any rate what they did was to make the suffrage dependent on stringent religious tests, and to repress with determined zeal all "vagaries" and "whimsies." Criticism of church or magistrates was not tolerated. Laws were modelled closely on the Bible. The clergy were a ruling class. The government was frankly theocratic. Said Winthrop (1637): "We see not that any should have authority to set up any other exercises besides what authority hath already set up"; and a synod at Cambridge in 1637 catalogued eighty-two "opinions, some blasphemous, others erroneous and all useless," besides nine "unwholesome expressions," all of which were consigned "to the devil of hell from whence they came." Another synod at Cambridge in 1647 more formally established the principle of state control. The legislation against Baptists (about 1644-1678) and the persecution of the Quakers (especially 1656-1662) partook of the brutality of the time, including scourging, boring of tongues, cutting of ears and in rare cases capital punishment. It cannot be denied that men like Roger Williams and some of the persecuted Quakers, though undeniably contentious and aggressive in their conscientious dissent, showed a spirit which to-day we should prize in tolerance and humanity, but not of the Puritan sort. And it seems necessary to emphasize these facts because until about 1870 it was almost unchallenged tradition to regard the men of Massachusetts Bay as seekers and champions of "religious liberty." They left England, indeed, for liberty to discard the "paperies" of the English Church, and once in Massachusetts they even discarded far more than those of
“poperies.” But religious liberty in our modern sense they did not seek for themselves, nor accord to others; they abhorred it, they trampled on it, and their own lives they subjected to all the rigid restrictions to which they subjected others. They were narrow but strong; no better example can be imagined of what the French call “the defects of one’s qualities.” Their failures were small compared with those of their contemporaries in England and elsewhere in Europe, and public opinion did not long sustain violent persecution of opinion. More than once mobs freed Quaker prisoners. Also it is to be said that with the single exception of religious toleration the record of the state in devotion to human rights has been from the first a splendid one, whether in human principles of criminal law, or in the defence of the civil rights commonly declared in American constitutions. It was once generally assumed that the repression practised attained its end of securing harmony of opinion. The fact seems to be that intellectual speculation was as strong in America as in Puritan England; the assumption that the inhibition of its expression was good seems wholly gratuitous, and contrary to general convictions underlying modern freedom of speech. A safer opinion is probably that “the spiritual growth of Massachusetts withered under the shadow of dominant orthodoxy; the church, though not the state, was saved” from religious and political life” (J. A. Doyle). In literature the second half of the 17th century is a sterile waste of forbidding theology; and its life, judged by the present day, singularly sombre.

In addition to the few persons banished to Rhode Island, theological and political differences led many to emigrate thither. Others, discontented with Massachusetts autocracy and wishing, too, “to secure more room,” went to Connecticut (q.v.) where they established a bulwark against the Dutch of New York. A witchcraft scare (at its worst in 1661–1667, though the earliest Connecticut case was in 1646–1647 and the earliest in Boston in 1648) led to another tragedy of ignorance. In all thirty-two persons were executed (according to W. F. Poole, about a thousandth part of those executed for witchcraft in the British Isles in the 16th and 17th centuries). Salem was the scene of the greatest excitement in 1691–1692.

Exceptionally honourable to the early colonists was their devotion to education (see Harvard University and Boston). Massachusetts Bay had a large learned element; it is supposed that one fourth or one fifth of Cambridge graduates went to every 250 persons in the colony. The earliest printing in the British-American colonies was done at Cambridge in 1639; it was not until 1674 that the authorities of the colony permitted printing, except at Cambridge. Boston and Cambridge remain leading publishing centres to-day. The first regular newspaper of Boston, the Boston Newsletter, was the pioneer of the American newspaper press.

The early history was rendered unquiet at times by wars with the Indians, the chief of which were the Pequot War in 1637, and King Philip’s War in 1675–76; and for better combining against these enemies, Massachusetts, with Connecticut, New Haven and New Plymouth, formed a confederacy in 1643, considered the prototype of the larger union of the colonies which conducted the War of American Independence (1775–83). The struggle with the Crown, which ended in independence, began at the foundation of the colony, with assumptions of power under the charter which the colonial government was always trying to maintain, and the crown was as assiduously evading counterract. After more than half a century of struggle, the crown finally cancelled the charter of the colony in 1684, though not until 1686 was the old government actually supplanted on the arrival of Joseph Dudley, a native of the colony, as president of a provisional council; later, Sir Edmund Andros was sent over with a commission to unite New York and New England under his rule. The colonists had been for many years almost independent; they made their own laws, the Crown appointed natives as officials, and the colonial interpretation of the old charter had in general been allowed to stand. Massachusetts had excluded the English Book of Common Prayer, she had restricted the franchise, laid the death penalty on religious opinions, and passed various other laws repugnant to the Crown, notably to Charles II. and James II.; she had caused laws and writs to run in her own name, she had neglected to exact the oath of allegiance to the sovereign, though carefully exacting an oath of fidelity to her own government, she had protected the regicides, she had coined money with her own seal, she had blocked legal appeals to the English courts, she had not compelled the observance of the navigation acts. The revo-
cation of the charter aroused the strongest fears of the colonists and Andros speedily met determined opposition by measures undertaken relative to taxation and land titles, by efforts to secure a church for Episcopal service, and an attempt to curb the town meetings. His government was supported by a small party (largely an Anglican Church party), but was intensely unpopular with the bulk of the people; and—it is a disputed question, whether before or after news arrived of the landing in England of William of Orange—in April 1689 the citizens of Boston rose in revolution, deposed Andros, imprisoned him and re-established their old colonial form of government. Then came a struggle, carried on in England by Increase Mather as agent (1689–1692) of the colony, to secure such a form of government as would preserve as many as possible of their old liberties. Plymouth, Connecticut, whose agent in London, endeavoured to secure a separate existence by royal charter, but accepted finally union with Massachusetts when association with New York became the probable alternative. The province of Maine was also united in the new provincial charter of 1601, and Sir William Phips came over with it, commissioned as the first royal governor. As has been mentioned already, the new charter softened religious tests for office and the suffrage, and accorded “liberty of conscience” except to Roman Catholics. The old religious exclusiveness had already been greatly lessened: the clergy were less powerful, heresy had thrived under repression, Anglican churchmen had come to the colony and were borne with perforce, devotion to trade and commerce had weakened theological tests in favour of ideals of mere good order and prosperity, and a spirit of toleration had grown.

Throughout the continuance of the government under the provincial charter, there was a constant struggle between a prerogative party, headed by the royal governor, and a popular party which had, in the collection of their practical independence under the colonial charter, and who were urging the sentiments which finally took the form of resistance in 1775. The inter-
charter period, 1686–1701, is of great importance in this connexion. The popular majority kept up the feeling of hostility to the royal authority in recurrent combats in the legislative assembly over the salary to be voted to the governor; though these antagonisms were from time to time forgotten in the wars with the French and Indians. During the earl of Bellomont’s administration, New York was again united with Massachusetts under the same executive (1697–1701). The scenes of the recurrent wars were mostly distant from Massachusetts proper, either in Maine or on Canadian or Acadian territory, although some savage inroads of the Indians were now and then made on the exposed frontier towns, as, for instance, upon Deerfield in 1704 and upon Haverhill in 1708. Phips, who had succeeded in an attack on Port Royal, had ignominiously failed when he led the Massachusetts fleet against Quebec in 1690; and the later expedition of 1711 was no less a failure. The most note-
worthy administration was that of William Shirley (1741–1749 and 1769–1775), who was the most efficient and the most willing officer of the British forces in North America. He made a brilliant success of the expedition against Louisburg in 1745, William Pepperell, a Maine officer, being in immediate command. Shirley with Massachusetts troops also took part in the Oswego expedition of 1755; and Massachusetts proposed, and lent the chief assistance in the expedition of Nova Scotia in 1755 which ended in the removal of the Acadians. Her officers and troops also played an important part in the Crown Point and second Louisburg expedition (1758).
The first decided protests against the exercise of sovereign power by the crown, the first general moral and political revolt that marked the approach of the American War of Independence, took place in Massachusetts; so that the most striking events in the general history of the colonies as a whole from 1760 to 1775 are an intimate part of her annals. The beginning of the active opposition to the crown may be placed in the resistance, led by James Otis, to the issuing of writs (after 1752, Otis's famous argument against them being made in 1760-1761) to compel citizens to assist the revenue officers; followed later by the outbreak of feeling at the imposition of the Stamp Act (1765), when Massachusetts took the lead in confronting the royal power. The governors put in office at this time by the crown were not of conciliatory temperaments, and the measures instituted in parliament (see United States) served to increase bitterness of feeling. Royal troops sent to Boston (several regiments, 1768) irritated the populace, who were highly excited at the time, until in an outbreak on the 5th of March 1770 a file of garrison troops shot down in self-defence a few citizens in a crowd which assailed them. This is known as the "Boston Massacre." The merchants combined to prevent the importation of goods which by law would yield the crown a revenue; the anti-prerogative party called themselves under the lead of Samuel Adams, the opulent merchant and one of the few of the rich who deserted the crown, leagued himself—forced on the movement, which became war in April 1775, when Gage sent an expedition to Concord and Lexington to destroy military stores accumulated by the patriots and to capture Adams and Hancock, temporarily staying at Lexington. This detachment, commanded by Lord Percy, was assaulted, and returned with heavy loss. The country towns now poured their militia into Cambridge, opposite Boston; troops came from neighbouring colonies, and Artemas Ward, a Massachusetts general, was placed in command of the irregular force, which with superior numbers at once shut the royal army up in Boston. An attempt of the provincials to seize and hold a commanding hill in Charlestown brought on the battle of Bunker Hill (June 17, 1775), in which the provincials were driven from the ground, although they lost much less heavily than the royal troops. Washington, chosen by the Continental Congress to command the army, arrived in Cambridge in July 1775, and stretching his lines around Boston, forced its evacuation in March 1776. The state was not again the scene of any conflict during the war. Generals Henry Knox and Benjamin Lincoln were the most distinguished officers contributed by the state to the revolutionary army. Out of an assessment at one time upon the states of $5,000,000 for the expenses of the war, Massachusetts was charged with $280,000, the next highest being $800,000 for Virginia. Of the 231,701 troops sent by all the colonies into the field, reckoning by annual terms, Massachusetts sent 67,907, the next highest being 31,939 from Connecticut, Virginia furnishing only 26,678, and her proportion of sailors was very much greater still. In every campaign in every colony save in 1779-80 her soldiery were in absolute, and still more in relative, number greater than those of any other colony.

After the outbreak of the war a somewhat indefinite, heterogeneous provisional government was in power till a constitution was adopted in 1780, when John Hancock became the first governor. Governor James Bowdoin in 1786-1787 put down with clemency an almost bloodless insurrection in the western counties (there was strong disaffection, however, as far east as Middlesex), known as the Shays Rebellion, significant of the rife ideas of popular power, the economic distress, and the unsettled political conditions of the years of the Confederation. Daniel Shays (1747-1825), the leader, was a brave Revolutionary captain of no special personal importance. The state debt was large, taxation was heavy, and industry was unsettled; worthless paper money was in circulation, yet some men demanded more; debtors were made desperate by prosecution; the state government seemed weak, the Federal government contemptibly so; the local courts would not, or from intimidation feared to, punish the turbulent, and demagogues encouraged ideas of popular power. A convention of delegates representing the malcontents in numerous towns in Worcester county met on the 6th of August 1786, and a week later a similar convention assembled at Hatfield, Hampshire county. Encouraged by these and other conventions in order to obstruct the collection of debts and taxes, a mob presented a session of the Court of Common Pleas and General Sessions of the Peace at Northampton on the 29th of August, and in September other mobs prevented the same court from sitting in Worcester, Middlesex and Berkshire counties. About 1000 insurgents under Shays assembled at Springfield on the 26th of September to prevent the sitting there of the Supreme Court, from which they feared indictments. To protect the court and the national arsenal at Springfield, for which the Federal government was powerless to provide a guard, Major-General William Shepard (1737-1817) ordered out the militia, called for volunteers, and supplied them with arms from the arsenal, and the court sat for three days. The Federal government now attempted to enlist recruits, ostensibly to protect the western frontier from the Indians, but actually for the suppression of the insurrection; but the plan failed from lack of funds, and the insurgents continued to interrupt the proceedings of the courts. In January 1787, however, Governor Bowdoin raised an army of 4400 men and placed under the command of Major-General Benjamin Lincoln (1733-1810). While Lincoln was at Worcester Shays planned to capture the arsenal at Springfield, but on the 25th of January Shepard's men fired upon Shays's followers, killing four and putting the rest to flight. Lincoln pursued them to Petersham, Worcester county, where on the 4th of February he routed them and took 150 prisoners. Subsequently the insurgents gathered in small bands in Berkshire county; but here, a league having been formed to assist the government, 84 insurgents were captured at West Stockbridge, and the insurrection practically terminated in an action at Sheffield on the 27th of February, in which the insurgents lost 2 killed and 30 wounded and the militia 2 killed and 1 wounded. Two of the insurgent leaders, Daniel Shays and Eli Parsons, escaped to Vermont soon after the rout at Petersham. Fourteen other insurgents who were tried by the Supreme Court in the spring of 1787 were found guilty of treason and sentenced to death. They were, however, held rather as hostages for the good behaviour of worse offenders who had escaped, and were pardoned in September. In February 1788 Shays and Parsons petitioned for pardon, and this was granted by the legislature in the following June. The outcome of the uprising was an encouraging test of loyalty to the commonwealth; and the insurrection is regarded as having been very potent in preparing public opinion throughout the country for the adoption of a stronger national government. The Federal Constitution was ratified by Massachusetts by only a small majority on the 6th of February 1788, after its
rejection had been at one time imminent; but Massachusetts became a strong Federalist state. Indeed, the general interest of her history in the quarter-century after the adoption of the Constitution lies mainly in her connexion with the fortunes of that great political party. Her leading politicians were out of sympathy with the conduct of national affairs (in the conduct of foreign relations, the distribution of political patronage, naval policy, the question of public debt) from 1804—when Jefferson's party showed its complete supremacy—onward; and particularly after the passage of the Embargo Act of 1807, which caused great losses to Massachusetts commerce, and, so far from being accepted by her leaders as a proper diplomatic weapon, seemed to them designed in the interests of the Democratic party. The Federalist preference for England over France was strong in Massachusetts, and her sentiment was against the war with England of 1812-15. New England's discontent culminated in the Hartford Convention (Dec. 1814), in which Massachusetts men predominated. The state, however, bore her full part in the war, and much of its naval success was due to her sailors.

During the interval till the outbreak of the Civil War in 1861, Massachusetts held a distinguished place in national life and politics. As a state she may justly be said to have been foremost in the struggle against slavery. She opposed the policy that led to the Mexican War in 1846, although a regiment was raised in Massachusetts by the personal exertions of Caleb Cushing. The leaders of the ultra non-political abolitionists (who opposed the formation of the Liberty party) were mainly Massachusetts men, notably W. L. Garrison and Wendell Phillips. The Federalist domination had been succeeded by Whig rule in the state; but after the death of the great Whig, Daniel Webster, in 1852, all parties disintegrated, re-aligning themselves gradually in an aggressive anti-slavery party and the temporizing Democratic party. First, for many years the Free-Soilers gained strength; then in 1855 in an extraordinary party upheaval the Know-Nothings quite broke up Democratic, Free-Soil and Whig organizations; the Free-Soilers however captured the Know-Nothing organization and directed it to their own ends; and by their junction with the anti-slavery Whigs there was formed the Republican party.

To this the original Free-Soilers contributed as leaders Charles Sumner and C. F. Adams; the Know-Nothings, Henry Wilson and N. P. Banks; and later, the War Democrats, B. F. Butler—all men of mark in the history of the state. Charles Sumner, the most eminent exponent of the new party, was the state's senator in Congress (1851-1874). The feelings which grew up, and the movements that were fostered till they rendered the Civil War inevitable, received something of the same impulse from Massachusetts which she had given a century before to the feelings and movements premonitory of the War of American Independence. When the war broke out it was her troops who first received hostile fire in Baltimore, and turned out their local mechanical training to account opened the obstructed railroad to Washington. In the war thus begun she built, equipped and manned many vessels for the Federal navy, and furnished from 1861 to 1865 26,163 (or, including final credits, probably more than 30,000) men for the navy. During the war all but twelve small townships raised troops in excess of every call, the excess throughout the state amounting in all to more than 15,000 men; while the total recruits to the Federal army (including en-re-enlistments) numbered, according to the adjutant-general of the state, 159,165 men, of which less than 7000 were raised by draft. The state, as such, and the townships spent $2,055,517.10 in the war; and private contributions of citizens are reckoned in addition at about $3,000,000, exclusive of the aid to families of soldiers, paid then and later by the state.

Since the close of the war Massachusetts has remained generally steadfast in adherence to the principles of the Republican party, and has continued to develop its resources. Navigation, which was formerly the distinctive feature of its business prosperity, has under the pressure of laws and circumstances given place to manufactures, and the development of carrying facilities on the land rather than on the sea.

In the Spanish-American War of 1898 Massachusetts furnished 11,780 soldiers and sailors, though her quota was but 7388; supplementing from her own treasury the pay accorded them by the national government.

No statement of the influence which Massachusetts has exerted upon the American people, through intellectual activity, and even through vagary, is complete without an enumeration of the names which, to Americans at least, are the signs of this influence and activity. In science the state can boast of John Winthrop, the most eminent of colonial scientists; Benjamin Thompson (Count Rumford); Nathaniel Bowditch, the translator of Laplace; Benjamin Peirce and Morse the electrician; not to include an adopted citizen in Louis Agassiz. In history, Winthrop and Bradford laid the foundations of her story in the very beginning; but the best example of the Colonial period is Thomas Hutchinson, and in later days Bancroft, Sparks, Palfrey, Prescott, Motley and Parkman. In poetry, a pioneer of the modern spirit in American verse was Richard Henry Dana; and later came Bryant, Longfellow, Whittier, Lowell and Holmes. In philosophy and the science of living, Jonathan Edwards, Franklin, Channing, Emerson and Theodore Parker. In education, Horace Mann; in philanthropy, S. G. Howe. In oratory, James Otis, Fisher Ames, Josiah Quincy, Junr., Webster, Choate, Everett, Sumner, Winthrop and Wendell Phillips; and, in addition, in statesmanship, Samuel Adams, John Adams and John Quincy Adams. In fiction, Hawthorne and Mrs Stowe. In law, Story, Parsons and Shaw. In scholarship, Ticknor, William H. Hunt, Horatio Greenough, W. W. Story and Thomas Ball. The "transcendental movement," which sprang out of German affilations and produced as one of its results the well-known community of Brook Farm (1841-1847), under the leadership of Dr George Ripley, was a Massachusetts growth, and in passing away left it, instead of traces of an organization, a sentiment and an aspiration for higher thinking which gave Emerson his following. When Massachusetts was called upon to select for Statuary Hall in the capitol at Washington two figures from the long line of her worthies, she chose as her finest representatives John Winthrop, the type of Puritanism and state-builder, and Samuel Adams (though here the choice was difficult between Samuel Adams and John Adams) as her greatest leader in the heroic period of the War of Independence.

Governors of Plymouth Colony

(Chosen annually by the people)

| John Carver | 1620-1621 |
| Edward Bradford | 1621-1633 |
| Edward Winslow | 1634-1635 |
| Edward Bradford | 1635-1636 |
| Edward Winslow | 1637-1638 |
| Thomas Prence (or Prince) | 1639-1639 |
| William Bradford | 1640-1641 |
| Edward Winslow | 1642-1645 |
| William Bradford | 1645-1655 |
| Edward Winslow | 1656-1668 |
| Thomas Prence (or Prince) | 1668-1669 |

1 Slavery had existed as a social fact from the earliest years, and legally after 1641; but it was never profitable, and was virtually abolished long before the War of American Independence; still it was never abolished explicitly by Massachusetts, though the slave trade was generally opposed, and a number of negroes were declared free after the adoption of the constitution of 1780 on the strength of the sweeping declaration of human rights in that instrument.

2 According to the final report of the U.S. Adjutant-General in 1885, the enlistments were 146,730 men, of whom 13,942 died in war. These figures are probably less accurate than those of the state.
Governors of Massachusetts

1 Endecott, by commission dated the 30th of April 1693, was made governor of London's plantation in the Massachusetts Bay. Matthew Cradock, first governor of the Company, from the 4th of March 1692 to the 20th of October 1692, was succeeded on the latter date by John Winthrop, who, on reaching Salem on the 12th of June 1693, took the charter, superseded Endecott. During three periods, 1701-1702, in February 1715, and from April to August 1757 the affairs of the colony were administered by the Executive Council.

2 General Gage was military governor, Hutchinson remaining nominally civil governor.

3 Under the Constitution, the legislature consists of a Senate and House of Representatives. The Senate consists of 40 members, elected for 6 years, one-third retiring each year. The House of Representatives consists of 200 members, elected for 2 years. The Governor is elected for 4 years. The legislature meets annually.
standard general history was that of J. G. Palfrey, History of New England (5 vols., Boston, 1856-1890), to the War of Independence. It is generally accurate in facts but written in an unsatisfactorily eulogistic vein. Of importance in more modern views is a volume of Lectures before the Massachusetts Historical Society on Subjects Relating to the Early History of Massachusetts (Boston, 1869), perhaps especially the lectures of G. E. Ellis, later expanded, and in the process somewhat of the Annals of the Puritans in America and the Massachusetts Bay, 1629-1685 (Boston, 1888; 3rd ed., 1891). See C. F. Adams, Massachusetts: its Historians and its History (Boston, 1895), for a critique of the "philosophic" traditions of Massachusetts writers; also his Three Episodes of Massachusetts History, namely, Settlement of the Colony, Antinomianism, and church and town government in Quincy from 1634-1688 (2 vols., Boston, 1892). On town government see further E. Channing in Johns Hopkins University Studies, (1885), and especially the 롤. Edward in American Antiquarian Society, Proceedings, new series, vol. 3, pp. 111-124; and C. F. Adams and others in Massachusetts Historical Society, Proceedings, 2nd series, vol. vii (1892). On the Pilgrims and Puritans in England and America (Boston, 1896) and The Puritans as Colonist and Reformer (Boston, 1899), On the Quaker Persecution: R. P. Hallowell, The Quaker Invasion of Massachusetts (Boston, 1883); rev. ed. (1887). On Witchcraft and Salem Witchcraft (2 vols., Boston, 1867); S. G. Drake, Annals of Witchcraft (Boston, 1866) and The Witchcraft Delusion in New England (3 vols., Roxbury, 1866), this last a reprint of accounts of the time by Cotton Mather and others. Further, see the controversy in American Antiquarian Society, Proceedings, vol. III, 1866, and Vol. IV, 1866, Collections, Massachusetts Historical Society, seven vols. (1866-1869). For economic history, W. B. Weeden, Economic and Social History of New England, 1620-1789 (2 vols., Boston, 1890); C. H. J. Douglas, The Financial History of Massachusetts, to the American Revolution (In Columbia University Studies, vol. V, New York, 1892). On the seven years War, see, Mellen Chamberlain, John Adams... with other Essays and Addresses (Boston, 1898): T. Hutchinson, Diary and Letters (2 vols., Boston, 1884-1886); H. A. Cushing, Travels from Provincial to Commonwealth Government in Massachusetts (Columbia University Studies in History, vol. III, 1896). On the Quaker movement, S. B. Harding, Contest over the Ratification of the Federal Constitution in Massachusetts (Harvard University Studies, New York, 1896); and on the Shays Rebellion compare J. P. Warren in American Historical Review (Oct., 1905). On New England in 1812, Henry Adams, Documents Relating to New England Federalism, 1780-1815 (Boston, 1877); T. W. Higginson, Massachusetts in the Army and Navy during the War of 1812-1855 (Official; Boston, 1885), and other Historical Society of Massachusetts bulletins. On the Quaker state consult A. M. Davis in Publications of the Colonial Society of Massachusetts, vol. I, the most important are the Massachusetts Historical Society, established 1791, collecting Collections and Proceedings (1869-1871). On the Massachusetts Society of American Antiquity, see its Proceedings, 1853-1891, published Proceedings (Worcester). In many cases the most valuable material on various periods is indicated under the biographies (or autobiographies in some cases) of the public men named in the above tables, to which see also the Society of American Historians and Genealogists, Joseph Warren, Elbridge Gerry, Benjamin Butler, G. S. Boutwell and George F. Hoar. Many townships have published their local records, and many township and county histories contain valuable matter of general interest (e.g., as showing history of the town before the War of Independence), though generally weighted heavily with genealogy and matters of merely local interest. In American works of fiction, particularly of New England authors, the reader will find a wealth of description of the lives and manners of the people, past and present, as in the writings of William D. Howell's, Sarah O. Jewett, Mary E. Wilkins-Freeman, Harriet B. Stowe and others.

MASSACRE, a wholesale indiscriminate killing of persons, and also, in a transferred sense, of animals. The word is adopted from the French; but its origin is obscure. The meaning and the old form maccase seem to point to it being a corruption of maccas, "to cut." The English "massacre" has come to mean "to fight, whaplpa, sword, and Lat. madare, to sacrifice. Another derivation connects with the Old Low Ger. maitsken, to cut in pieces; of mod. Ger. melaten, to massacre.

MASSAGE. The word "massage" has had late years come into general use to signify the method of treating disease or other physical conditions by manipulating the muscles and joints. According to Liltrt the word is derived from the Arabic masa, and has the specific meaning of "pressing the muscular parts of the body with the hands, and exercising traction on the joints in order to give suppleness and stimulate vitality." It was probably adopted from the Arabian physicians by the French, who have played a leading part in reviving this method of treatment, which has been practised from time immemorial, and by the most primitive people, but has from time to time fallen into disuse among Western nations. In the Odyssey the women are described as rubbing and kneading the heroes on their return from battle. In India, under the name "shampoo" (shampu), the same process has formed part of the native system of medicine from the most remote times; professional massers were employed there by Alexander the Great in 327 B.C. In China the method is also of great antiquity, and practised by a professional class; the Swedish gymnastic system instituted by Pehr Henrik Ling is derived from the book of Cong-Fou, the bonze of Tao-Sse. Hipocrates describes and enjoins the use of manipulation, especially in cases of stiff joints, and he was followed by other Greek physicians. Oribasius gives an account of the application of friction with the bare hands, which exactly corresponds with the modern practice of massage. It is worthy of note that the treatment, after being held in high esteem by the leading Greek physicians, fell into disrepute with the profession, apparently on account of its association with vicious abuses. The same drawback has made itself felt in the present day, and can only be met by the most scrupulous care in the choice of agents and the manner of their employment. Among the Greeks, Romans, Egyptians, and later the Turks, massage came to be part of the ordinary procedure of the bath without any special therapeutic intention, and the usage has survived until to-day; but that mode of application was no doubt a refinement of civilized life. Medical rubbing is older and more elementary than bathing, as we see from its employment by savages. Probably it was evolved independently among different races from the natural instinct—shared by the lower animals—which teaches to rub, press or lick any part of the body in which uneasiness is felt, and is therefore the oldest of all therapeutic means.

According to Weiss, the therapeutic use of massage was revived in Europe by Hieronymus Fabricius ab Aquapendente (1537-1619), who applied it to stiff joints and similar conditions. Paracelsus in his De medicina Aegyptiorum (1591), gives a description of methodical massage as practised by the Egyptians quite on modern lines. Thereafter it appears to have been adopted here and there by individual practitioners, and various references are made to it, especially by French writers. The word "massage" occurs in an essay written by Pierre Adolphe Piery (1794-1879) for a large encyclopaedia which appeared in 1816, but it was probably used before. The practice was gradually adopted by an increasing number of medical men. In Great Britain it was called "medical rubbing," and at Edinburgh Beveridge had a staff of eight trained male practitioners. A book published by Estradére in 1863 attracted much attention, but the man who contributed most to the modern popularity of massage was Metzger of Amsterdam, who began to use it tentatively in 1853, and then proceeded to study and apply it methodically. He published an essay on the subject in 1868. The modern refinements of the treatment are chiefly due to him. At the same time, its application by Dr Silas Weir Mitchell to hysterical and other nervous conditions, in conjunction with the "rest cure," has done much to make it known.

Massage, as now practised, includes several processes, some of which are passive and others active. The former are carried out by an operator, and consist of rubbing and kneading the superficial and deeper tissues with the hands, and of applying the joints by bending the patient's limbs. The active movements consist of a special form of gymnastics, designed to exercise particular muscles or groups of muscles. In what is called "Swedish massage" the operator moves the limbs while the patient resists, thus bringing the opposing muscles into play. Some writers insist on confining the word "massage" to the rubbing processes, and use the general term "manipulation"
MASSAGETAE—MASSAWA

It was against their queen Tomyris that Cyrus undertook the expedition in which according to one story he met his end. In their usages some tribes were nomads like the people of Scythia (q.v.), others with their community of wives and habit of killing and eating their parents recalled the Issedones (q.v.); while the dwellers in the islands of the river were fish-eating savages. Probably the name denoted no ethnic unity, but included all the barbarous north-eastern neighbours of the Persians. Herodotus says they only used gold and copper (or bronze), not silver or iron. Their lavish use of gold has caused certain massive ornaments from southern Siberia, now in the Hermitage at St Petersburg, to be referred to the Massagetae.

(E. H. M.)

MASSA MARITTIMA, a town and episcopal see of the province of Grosseto, Tuscany, Italy, 24 m. N.W. of Grosseto direct and 16 m. by rail N.E. of Follonica (which is 28 m. N.W. of Grosseto on the main coast railway), 1444 ft. above sea-level. Pop. (1901), (town) 9210; (commune) 17,516. It has a cathedral of the 13th century containing a Romanesque font (1267 with a cover of 1447) and a Gothic reliquary (1324) of the saint. Cornelius who was the cathedral's patron. The ducal residence, the Palazzo Comunale, stands at the south end of the town, while the National Palace, occupied by the municipal government, is at the north. Massa stands, in the valley of the river which issues from the mountains of the Monti Pisani, on the left bank of the Lari, a tributary of the Metauro. The river winds through a level plain as far as the Mouth of the Lower Metauro near the town, when it turns north-west to join the Massa at the latter's mouth. The town is on the main road between Grosseto and Livorno, and is a winter resort for the rural population of the district. Its population is essentially agricultural, except for a small number of manufacturers. It is noted for the production of fine glass, and is a place of considerable trade. Among the manufactures are: glass and cutlery, wine, oil, cheese, and figs. It is connected by road with Grosseto, which is the terminus of a railway. The town forms a centre for the cultivation of the olive, and is noted for the wool of its sheep. The town is the seat of a bishopric, erected in 1197.

(M. W.)

MASSAWA, or Massowah, a fortified town on the African coast of the Red Sea, chief port of the Italian colony of Eritrea, in 15° 36' N. and 39° 28' E. Pop. about 10,000. The town stands at the north end of the bay of Massawa and is built partly on a coral island of the same name—where was the original settlement and partly on the islands of Tautlub and Sheik Said, and the neighbouring mainland. Massawa Island is from 20 to 25 ft. above the sea, its length does not exceed ½ m. and its breadth is about ¼ m. The harbour is formed by the channel between the island and the mainland. It affords good anchorage in from 5 to 9 fathoms. The town possesses several good public buildings, chiefly built of coral, as are the houses of the principal European and Arab merchants. Landward the town is guarded by forts erected by the Italians since 1885. Water was formerly secured; between 1872 and 1878 an ancient aqueduct from Mokullu (5 m. distant westward) was restored and continued by an embankment to the town. A railway connects Massawa with Asmara, the capital of the colony. Besides the Abyssinians, who speak a Tigré dialect corrupted with Arabic, the inhabitants comprise Italian officials and traders, Greeks, Indians, Arabs from Yemen and Hadramut, Gallas and Somalis. Massawa is the natural port for northern Abyssinia but commerce is undeveloped owing to the lack of rapid means of communication. The trade done consists mainly in exporting hides, butter, Abyssinian coffee and civet, and importing European and Indian cotton goods and silks. It increased in value from about £65,000 per annum in 1865 (the last year of Turkish control) to from £240,000 to £280,000 between 1879 and 1881, when under the administration of Egypt. Under the Italians trade greatly developed. The returns for the five years 1901-1905 showed an average annual value of £1,800,000 (about two-thirds being imports).

The island of Massawa was held by the Genoese and in 1835 it was taken by the Abyssinians who had been invaded from a very early date. It appears to have formed part of the Abyssinian dominions for many centuries. It was at Massawa (Matzua, as it is called by the Portuguese chroniclers) that Christopher da Gama and his comrades landed in July 1541 on their way to aid the Abyssinians against the Moslem invaders. Captured by the Turks in 1557, the island remained a Turkish possession over two hundred years. A military colony of Bosnians settled at Arkiko (a port on the bay 4 m. south of Massawa Island) was appointed not only to defend it in case of attack from the mainland, but to keep it supplied with water in return for $1400 per month from the town's customs. For some time at the close of the 18th century Massawa was held by the shield of Mecca, and it afterwards passed to Mehmet Ali...
of Egypt. The Turks were reinstated about 1850, but in 1865 they handed the island back to Egypt for an annual tribute of 25 million piastres. In February 1885 Massawa was occupied by an Italian force, the Egyptian garrison stationed there being withdrawn in the November following (see Egypt; Italy; Abyssinia). The port was the capital of the Italian colony until 1900 when the seat of administration was removed to Asmara (see ERITREA).

For a description of the town in 1760 see the Travels of James Bruce. At that time the governor, though appointed by the Turks, paid one half of the customs receipts to the negus of Abyssinia in return for the protection of that monarch.

MASSÉNA, ANDRÉ, or ANDREA, duke of Rivoli, prince of Essling (1756–1817), the greatest of Napoleon's marshals, son of a small wine merchant, it is said of Jewish origin, was born at Nice on the 6th of May 1756. His parents were very poor, and he began life as a cabin boy, but he did not care much for the sea, and in 1775 he enlisted in the Royal-Italian regiment. He quickly rose to be under-officer-adjutant; but, finding his birth would prevent his ever getting a commission, he left the army in 1789, retired to his native city, and, in the pursuit of his avocation of writing, resolved on a career in the world, and his desire to see service increased, and he once more left Italy, and joined the 3rd battalion of the volunteers of the Var in 1791. In those days when men elected their officers, and many of the old commissioned officers had emigrated, promotion to a man with a knowledge of his drill was rapid, and by February 1792 Masséna was a lieutenant-colonel. His regiment was one of those in the army which occupied Nice, and in the advance to the Apennines which followed, his knowledge of the country, of the language, and of the people was so useful that in December 1793 he was already a general of division. In command of the advanced guard he won the battle of Saorgio in August 1794, capturing ninety guns, and after many successes he at last, on the 23rd of November 1795, with the right wing of the army of Italy, had the greatest share in the victory of Loano, won by Schérer over the Austrians and Sardinians. In Bonaparte's great campaign of 1796–97 Masséna was his most trusted general of division; in each battle he won fresh laurels, up to the crowning victory of Rivoli, from which he afterwards took his title. It was during this campaign that Bonaparte gave him the title of enfant gâté de la victoire, which he was to justify till he met the English in 1810. In 1798 he commanded the army of Rome for a short time, but was displaced by the intrigues of his subordinate Berthier. Masséna's next important service was in command of the army in Switzerland, which united the army in Germany under Moreau, and that in Italy under Joubert. There he proved himself a great captain, as he had already proved himself a great lieutenant; the archduke Charles and Suvarov had each been successful in Germany and in Italy, and now turned upon Masséna in Switzerland. That general held his ground well against the archduke, and then suddenly, leaving Soult to face the Austrians, he transported his army to Zürich, where, on the 26th of September 1799, he entirely defeated Korsakov, taking 200 guns and 5000 prisoners. This campaign and battle placed his reputation on a level with that of his compatriot Bonaparte, and he might have made the revolution of Brumaire, but he was so sincerely attached to the republic, and had no ambition beyond a desire to live well and to have plenty of money to spend. Bonaparte, now First Consul, sent him to Genoa to command the débris of the army of Italy, and he nobly defended Genoa from February to June to the very last extremity, giving time for Bonaparte to strike his great blow at Marengo. He now went to Paris, where he sat in the Corps Législatif in 1803, and actually defended Moreau without drawing upon himself the ill-will of Napoleon, who well knew his honesty and lack of ambition.

In 1804 he was made one of the first marshals of France of the new régime, and in 1805 was decorated with the Grand Eagle of the Legion of Honour. In that year Napoleon needed an able general to keep in check the archduke Charles in Italy, while he advanced through Germany with the grand army. Masséna was chosen; he kept the archduke occupied till he received news of the surrender of Ulm, and then on the 30th of October defeated him in the battle of Caldiero. After the peace of Pressburg had been signed, Masséna was ordered to take possession of the city of Naples, and to place Joseph Bonaparte on the throne. This task done, Napoleon summoned Masséna to Poland, where he as usual distinguished himself, and where he for the time gave up his republican principles. In 1808 he was made duke of Rivoli. In 1808 he was accidentally wounded by his old enemy Berthier when both were in attendance on the emperor at a shooting party, and he lost the sight of one eye. In the campaign in 1809 he covered himself with glory at Landshut and at Eckmühl, and finally at the battle of Aspern-Essling his magnificent leadership made what would without him have been an appalling disaster into a mere reverse of which the enemy could make no use. On the field of Wagram Masséna, though too ill to ride, directed from his carriage the movements of the right wing. For his great services he was created prince of Essling, and given the princely castle of Thouars. He was then ordered to Spain to "drive the English into the sea." (For the campaigns of 1810 and 1811, the advance to and the retreat from Torres Vedras see Peninsular War.) Masséna himself, with some justice, ascribed his failure to the frequent disobedience of his subordinates Ney, Reynier and Junot, and public opinion attributed this disobedience to the presence with the army of Masséna's mistress, and to the resentment thereat felt by the wives of the three generals. Still, unsuccessful as he was, Masséna displayed the determination of the defence of Genoa and the fertility in expedients of the campaign of Zürich, and kept his army for five weary months close up to Wellington's impregnable position before retiring. His retreat through a devastated country was terrible, but his forte of character kept his men together, and Ney having shown the worst side of his character now showed the best in the frequent and brilliant rear-guard actions, until a new act of insubordination at last made the old marshal dismiss Ney from his command. Soon Masséna was once again ready to try his fortune, and he nearly defeated Wellington at Fuentes d'Oñoro, though much hampered by Bessières. But his recall soon followed this and he returned home to find his prestige gone. The old marshal felt he had a right to complain of Ney and of Napoleon himself, and, it is said, opened communications with Fouché and the remnant of the republican party. Whether this be true or not, Napoleon gave his greatest marshal no more employment in the field, but made him merely a territorial commandant at Marseilles. This command he still held at the restoration, when Louis XVIII. confirmed him in it, and with true Bourbon stupidity gave him letters of naturalization, as if the great leader of the French armies had not ceased to be an Italian. When Napoleon returned from Elba, Masséna, probably by the advice of Fouché, kept Marseilles quiet to await events, the greatest service he could do the royalists, but afterwards impeded him to a fault. After the second restoration Masséna was summoned to sit on the court-martial which tried Marshal Ney, but, though he had been on bad terms with that general, and attributed his own disgrace to him, the old soldier would not be his comrade's judge. This refusal was used by the royalists to attack the marshal, against whom they raked up every offence they could think of. This annoyance shortened his life, and on the 4th of April 1817 the old hero died. He was buried in Père-la-Chaise, with only the word "Masséna" upon his tombstone.

In private life indolent, greedy, rapacious, ill-educated and morose, in war Masséna was, like Napoleon, the incarnation of battle. Only his indolence and his consequent lack of far-reaching imagination prevented him being as great in strategy as in tactics. His genius needed the presence of the enemy to stimulate it, but once it sprang to life Masséna became an ideal leader, absolutely brave, resourceful, unrelenting and indefatigable. He was as great a master of the strategy of forces in immediate contact—of gathering up as it were the threads of the fugue into a "stretto." For the planning of a whole perfect campaign he
had neither knowledge nor inclination, and he falls short therefore of the highest rank amongst great generals; but his place amongst the greatest of soldiers is beyond challenge.

See Thibault's *Éloge funèbre, and Koch's *Mémoires de Masséna* (4 vols., 1849), a valuable work, carefully compiled. In more modern times G. Gachot has produced several important works dealing with Masséna's campaigns.

**MASSENBACH, CHRISTIAN KARL AUGUST LUDWIG VON** (1758-1827), Prussian soldier, was born at Schmallkalden on the 16th of April 1758, and educated at Heilbronn and Stuttgart, devoting himself chiefly to mathematics. He became an officer of the Württemberg army in 1778, and left this for the service of Frederick the Great in 1782. The pay of his rank was small, and his appointment on the quartermaster-general's staff made it necessary to keep two horses, so that he had to write mathematical school-books in his spare time to eke out his resources. He was far however from neglecting the science and art of war, for thus early he had begun to make his name as a theorist as well as a mathematician. After serving as instructor in mathematics to the young prince Louis, he took part with credit in the expedition into Holland, and was given the order *Pour le mérite.* On returning to Prussia he became mathematical instructor at the school of military engineering, leaving this post in 1792 to take part as a general staff officer in the war against France. He was awarded a prebend at Minden for his services as a topographical engineer on the day of Valmy, and after serving through the campaigns of 1793 and 1794 he published a number of memoirs on the military history of these years. He was chiefly occupied however with framing schemes for the reorganization of the then neglected general staff of the Prussian army, and many of his proposals were accepted. Bronsart von Schellendorf in his *Duties of the General Staff* says of Massenbach's work in this connexion, "the organization which he proposed and in the main carried out survived even the catastrophes of 1806-1807, and has since been the permanent and original outline." This must be accounted as high praise when it is remembered how much of the responsibility for these very disasters must be laid to Massenbach's account. The permanent gain to the service due to his exertions was far more than formal, for it is to him that the general staff owes its tradition of thorough and patient individual effort. But the actual doctrine taught by Massenbach, who was now a colonel, may be summarized as the doctrine of positions carried to a ludicrous excess; the claims put forward for the general staff, that it was to prepare cut-and-dried plans of operations in peace which were to be imposed on the troop leaders in war, were derided by the responsible generals; and the memoirs on proposed plans of campaign to suit certain political combinations were worked out in quite unnecessary detail.

It was noteworthy that none of the proposed plans of campaign considered France as an enemy.

In 1805 came the threat of war with Napoleon which Massenbach had strongly opposed. He was made quartermaster-general (chief of staff) to Prince Hohenlohe, over whom he soon obtained a fatal ascendency. War was averted for a moment by the result of the battle of Austerlitz, but it broke out in earnest in October 1806. Massenbach's influence clouded all the Prussian operations. The battles of Jena and Auerstädt were lost, and the capitulation of Prince Hohenlohe's army was negotiated. Even suggestions of disloyalty were not wanting; an attempt to try him by court-martial was only frustrated by Prince Hohenlohe's action in taking upon himself, as commander-in-chief, the whole responsibility for Massenbach's actions. He then retired to his estate in the Posen province, and occupied himself in writing pamphlets, memoirs, &c. When his estates passed into the grand duchy of Warsaw, he chose to remain a Prussian subject, and on the outbreak of the war of liberation he asked in vain for a post on the Prussian staff. After the fall of Napoleon in 1815, Massenbach took part in Württemberg politics, was expelled from Stuttgart and Heidelberg, and soon afterwards arrested at Frankfurt, delivered over to the Prussian authorities and condemned to fourteen years' fortress imprisonment for his alleged publication of state secrets in his memoirs. He was kept in prison till 1826, when Frederick William III., having recovered from an accident, pardoned those whom he considered to have wronged him most deeply. He died on the 21st of November 1827, at his estate of Bialokosce, Posen.

The obituary in *Neuer Nekrolog der Deutschen,* pt. ii. (Ilmenau, 1827) is founded on a memoir (*Der Oberst C. v. Massenbach*) which was published at the beginning of his imprisonment.

**MASSNET, JULES ÉMILE FRÉDÉRIC** (1842-), French composer, was born at Montaub, on the 12th of May 1842. He studied at the Paris Conservatoire, where he obtained the Grand Prix de Rome in 1863 with the cantata *David Rizio.* Massenet became one of the most prolific composers of his time. His operas include the following: *La Grande Tante,* one act, opéra comique (1886); *Don César de Bazan,* three acts, opéra comique (1872); *Le Roi de Lahore,* five acts, opéra (1877); *Héroïdes,* five acts (Brussels, 1881); *Manon,* five acts, opéra comique (1884); *Le Cid,* four acts, opéra (1885); *Excarmonde,* four acts, opéra comique (1889); *Le Mage,* five acts, opéra (1891); *Werther,* four acts (Vienna, 1892); *Thaïs,* three acts, opéra (1894); *Le Portrait de Manon,* one act, opéra comique (1894); *La Novarrazé,* two acts (Covent Garden, 1894); *Sapho,* opéra comique (1897); *Cendrillon,* opéra comique (1900); *Grisélidis,* opéra comique (1901); *Le Jongleur de Notre Dame* (Mentone, 1902). Of these the most popular is *Manon.* Massenet's other works include *Marie Madeleine,* sacred drama (1873); *Eve,* a mystery (1875); *La Vierge,* sacred legend (1880); six orchestral suites entitled *Scènes héroïques,* *Scènes pittoresques,* *Scènes dramatiques,* *Scènes napolitaines,* *Scènes de fée,* *Scènes alsaciennes*; music to the tragedy *Les Ermyntrud,* to *Thébodore,* *La Crocodile,* *L'Hetman,* a requiem, *Narcisse,* an idyll, *Biblis,* a *Scène antique*; several sets of songs, entitled *Poème d'avant,* *Poème d'amour,* *Poème d'hiver,* *Poème d'octobre,* *Poème pastoral,* *Poème du souvenir*; also a large number of detached songs. He was professor of composition at the Conservatoire from 1878 to 1886, among his pupils being Hilmelcher, Marty, Brunwein, Vidal, Pierné, and Dufay. Massenet undoubtedly possesses a style of his own. He is at his best in music descriptive of the tender passion, and many of the love scenes in his operas are very beautiful.

**MASSEREENE, JOHN CLOTWORTHY, 1ST VISCOUNT** (d. 1665), Anglo-Irish politician, was a son of Sir Hugh Clotworthy, sheriff of county Antrim. He was elected to the Irish parliament as member for county Antrim in 1634, and was a member both of the Short and of the Long Parliament in England. Clotworthy was a vehement opponent of the earl of Strafford, in whose impeachment he took an active share. He also took part in the prosecution of Archbishop Laud. Having unsuccessfully negotiated with Ormond for the surrender of Dublin to the Parliamentary forces in 1646, he was accused in the following year of having betrayed his cause, and also of embezzlement; in consequence of these charges he fled to the Continent, but returned to parliament in June 1648. On the 12th of December in that year he was arrested, and remained in prison for nearly three years. Having taken an active part in forwarding the Restoration, he was employed in Ireland in arranging the affairs of the soldiers and other adventurers who had settled in Ireland. Clotworthy in no way abated his old animosity against "papists" and high Anglicans, and he championed the cause of the Irish Presbyterians; but being personally agreeable to Charles II., his ecclesiastical views were overlooked, and on the 21st of November 1660 he was created Baron Loughneagh and Viscount Massereene in the Irish peerage, with remainder in default of male heirs to his son-in-law, Sir John Skeffington. Massereene died without male issue in September 1665, and the title devolved on Skeffington, whose great-grandson, the fifth viscount, was created earl of Massereene in 1756. The earldom became extinct on the death of the fourth earl without male issue in 1816, the viscountcy and barony of Loughneagh descending to his daughter Harriet, whose husband, Thomas Foster, took the name of Skeffington, and inherited from his mother in 1824 the titles of Viscount Ferrand and Baron Oriel of Collon in the Irish peerage, and from his father in 1828 that of Baron Oriel of Ferrand in the peerage of the United Kingdom.
MASSEY, SIR EDWARD — MASSILLON, J. B.

MASSEY, SIR EDWARD (c. 1619—c. 1674), English soldier in the Great Rebellion, was the son of John Massey of Coddington, Cheshire. Little is known of his early life, but it is said that he served in the Dutch army against the Spaniards. In 1639 he appears as a captain of pioneers in the army raised by Charles I. to fight against the Scots. At the outbreak of the Great Rebellion he was with the king at York, but he soon joined the Parliamentary army. As lieutenant-colonel under the earl of Stamford he became deputy governor of Gloucester, where he remained till towards the end of the first Civil War, becoming governor early in 1643. He conducted minor operations against numerous small bodies of Royalists, and conducted the defence of Gloucester against the king’s main army in August 1643, with great steadiness and ability, receiving the thanks of parliament and a grant of £1000 for his services. In 1644 Massey continued to keep the field and to disperse the local Royalists, and on several occasions he measured swords with Prince Rupert. In May 1644 he was made general of the forces of the Western Association. In 1645 he took the offensive against Lord Goring and the western Royalists, advanced to the relief of Taunton, and in the autumn co-operated effectively with Sir Thomas Fairfax and the New Model army in the Langport campaign. After taking part in the desultory operations which closed the first war, he took his seat in the House of Commons as member for Gloucester. He then began to take an active part in politics on the Presbyterian side, and was one of the generals who was impeached by the army on the ground that they were attempting to revive the Civil War in the Presbyterian interests. Massey fled from England in June 1647, and though he resumed his seat in the house in 1648 he was again excluded by Pride’s Purge, and after a short imprisonment escaped to Holland. Thence, taking the side of the king openly and definitely like many other Presbyterians, he accompanied Charles II. to Scotland. He fought against Cromwell at the bridge of Allan and Inverkeithing, and was advanced to the rank of general in the Royalist army in the invasion of England in 1651. It was hoped that Massey’s influence would win over the towns of the Severn valley to the cause of the king, and the march of the army on Worcester was partly inspired by this expectation. However, he effected little, and after riding with the king for some distance from the field of Worcester, fell into the hands of his former comrades and was lodged in the Tower. He again managed to escape to Holland. While negotiating with the English Presbyterians for the restoration of Charles, he visited England twice, in 1654 and 1656. In 1660 he was active in preparing for Charles’s return, and was rewarded by a knighthood and a grant of £1000. The rest of his life was spent in political, and occasionally in military and administrative business, and he is said to have died in Ireland in 1674 or 1675.

MASSEY, GEORGE (1828-1907), English poet, was born near Tring, Hertfordshire, on the 29th of May 1828. His parents were in humble circumstances, and Massey was little more than a child when he was set to hard work in a silk factory, which he afterwards deserted for the equally laborious occupation of straw-plaiting. These early years were rendered gloomy by much distress and deprivation, against which the young man strove with increasing spirit and virility, educating himself in his spare time, and gradually cultivating his innate taste for literary work. He was attracted by the movement known as Christian Socialism, into which he threw himself with whole-hearted vigour, and so became associated with Maurice and Kingsley. His first public appearance as a writer was in connexion with a journal called the Spirit of Freedom, of which he became editor, and he was only twenty-two when he published his first volume of poems, Voice of Freedom and Lyrics of Love. These he followed in rapid succession by The Ballad of Babe Christabel (1854), War Weats (1855), Hamlock’s March (1860), and A Tale of Eternity (1860). Many years afterwards in 1886, he collected the best of the contents of these volumes, with additions, into a two-volume edition of his poems called My Lyrical Life. He also published works dealing with spiritualism, the study of Shakespeare’s sonnets (1872 and 1890), and theological speculation. It is generally understood that he was the original of George Eliot’s Felix Holt. Massey’s poetry has a certain rough and vigorous element of sincerity and strength which easily accounts for its popularity at the time of its production. He treated the theme of Sir Richard Grenville before Tennyson thought of using it, with much force and vitality. Indeed, Tennyson’s own praise of Massey’s work is still its best eulogy, for the Laureate found in him “a poet of fine lyrical impulse, and of a rich half-Oriental imagination.” The inspiration of his poetry is essentially British; he was a patriot to the core. It is, however, as an Egyptologist that Gerald Massey is best known in the world of letters. He first published The Book of the Beginnings, followed by The Natural Genesis; but by far his most important work is Ancient Egypt: The Light of the World, published shortly before his death. He died on the 29th of October 1907.

An article by J. Churton Collins in the Contemporay Review (May 1904).

MASSICUS, MONS, a mountain ridge of ancient Italy, in the territory of the Aurunci, and on the border of Campania and Latium adjectum—attributed by most authors to the latter. It projects south-west from the volcanic system of Rocca Monfina (see SUessa AURUNCA) as far as the sea, and separates the lower course of the Liris from the plain of Campania. It consists of limestone, with a superstratum of plicenic and volcanic masses, and was once an island; its highest point is 2661 ft. above sea-level.

It was very famous for its wine in ancient times. There was just room along the coast for the road to pass through; the pass was guarded by the Auruncian town of Vesica (probably on the mountain side), which ceased to exist in 314 B.C. after the defeat of the Ausones, but left its name to the spot. Its successor, Sinussa, on the coast, was destroyed in 312 B.C., and a colony of the colony of Sinussa was founded there in 295 B.C. It is not infrequently mentioned by classical writers as a place in which travellers halted. Here Virgil joined Horace on the famous journey to Brundusium. Domitian constructed a church and temple of Jupiter, and by the construction of a road, Via Domitiana, which left the Via Appia here and ran to Cumae and Putolessi and, it was he, no doubt, who raised it to the position of colonia Flavia. The town was destroyed by the Saracens, but some ruins are still to be seen, about two miles north-west of the modern village of Mondragone. The mineral springs which still rise here were frequented in antiquity.

MASSIF, a French term, adopted in geography for a mountainous mass or group of connected heights, whether isolated or forming part of a larger mountain system. A “massif” is more or less clearly marked off by valleys.

MASSILLON, JEAN BAPTISTE (1663-1742), French bishop and preacher, was born at Hyères on the 24th of June 1663, his father being a royal notary of that town. At the age of eighteen he joined the Congregation of the Oratory and taught in a college at Pézenas, and Montbrison and at the Seminary of Vienne. On the death of Henri de Villars, archbishop of Vienne, in 1693, he was commissioned to deliver a funeral oration, and this was the beginning of his fame. In obedience to Cardinal de Noailles, archbishop of Paris, he left the Cistercian abbey of Sept-Fonds, to which he had retired, and settled in Paris, where he was placed at the head of the famous seminary of Saint Magloire. He soon gained a wide reputation as a preacher and was selected to be the Advent preacher at the court of Versailles in 1699. He was made bishop of Clermont in 1717, and two years later was elected a member of the French Academy. The last years of his life were spent in the faithful discharge of his episcopal duties; his death took place at Clermont on the 18th of September 1742. Massillon enjoyed in the 18th century a reputation equal to that of Bossuet and of Bourdaloue, and has been much praised by Voltaire, D’Alembert and kindred spirits among the Encyclopédistes. His popularity was probably due to the fact that in his sermons he lays little stress on dogmatic questions, but treats generally of moral subjects, in which the secrets of the human heart and the processes of man’s reason are described with poetical feeling. He has usually been contrasted with his predecessor Bourdaloue, the latter having the credit of vigorous denunciation, Massillon that of gentle persuasiveness. Besides the Petit Cérémon, a sermon which he
MASSILLON—MASSINGER

delivered before the young king Louis XV. in 1718, his sermons on the Prodigal son, on the small number of the elect, on death, for Christmas Day, and for the Fourth Sunday in Advent, may be perhaps cited as his masterpieces. His funeral oration on Louis XIV. is only noted now for the opening sentence: "Dieu seul est grand." But in truth Massillon is singularly free from inequality. His great literary power, his reputation for benevolence, and his known toleration and dislike of doctrinal disputes caused him to be much more favourably regarded than most churchmen by the philosophes of the 18th century.

The first edition of Massillon's complete works was published by his nephew, also an Oratorian (Paris, 1745-1748), and upon this, in the absence of MSS. succeeding reprints were based. The best modern edition is that of Abbé Blamпignon (Paris, 1865-1868, 4 vols.; new ed. 1886).

See Abbé Blamпignon, Massillon, d'après des documents intérêts (Paris, 1879); and L'Épiscopat de Massillon d'après des documents intérêts, suivi de sa correspondance (Paris, 1884); F. Brunetiere "L'Éloquence de Massillon" in Études critiques (Paris, 1882); Père Ingold, L'Oratoire et le jansénisme au temps de Massillon (Paris, 1886); and Louis Petit de Julliéville's Histoire de la langue et de la littérature française, v. 372-385 (Paris, 1898).

MASSILLON, a city of Stark county, Ohio, U.S.A., on the Tuscarawas river, about 6 m. W. of Canton, and about 50 m. s. b. E. of Columbus, Poole (1901), No. 9, an incorporated city (1910), 13,879. It is served by the Pennsylvania (Pittsburg, Ft Wayne & Chicago Division), the Baltimore & Ohio and the Wheeling & Lake Erie railways. Massillon is built among hills in a part of the state noted for its large production of coal and wheat and abounding in white sandstone, iron ore and potter's clay. The city has various manufactures, including iron, engines, furnaces, reapers, threshers and bottles. The total value of the factory products in 1905 was $3,707,013, an increase of 34.8% over that of 1900. The first settlement was made in 1825; in 1860 the town was laid out and named in honour of Jean Baptiste Massillon; it was incorporated a village in 1853, and became a city in 1868.

MASSIMO, or Massimi, a Roman princely family of great antiquity, said to be descended from the ancient Maximi of republican Rome. The name is first mentioned in 1012 in the person of Leo de Maximis, and the family played a considerable part in the history of the city in the middle ages. The brothers Pietro and Francesco Massimi acquired fame by protecting and encouraging the German printer Ulrich Hahn, who came to Rome in 1467. In the 16th century the Massimi were the richest of the Roman nobles. A marquisate was conferred on them in 1544, and the lordship of Arsl in 1574. To-day there are two branches of the Massimi, viz. the Principi Massimo, descended from Camillo Massimi, 1770-1840, and the dukes of Rignano, descended from Francesco Massimi (1772-1844). One of the sons of the present Prince Camillo Carlo Alberto, Don Fabrizio, married Princess Beatrice, daughter of Don Carlos of Bourbon (duc of Madrid), the pretender to the Spanish throne. The Palazzo Massimo in Rome was built by Baldassare Peruzzi by order of Pietro Massimo, on the ruins of an earlier palace destroyed in the sack of Rome in 1527.

See F. Gregorovius, Geschichte der Stadt Rom (Stuttgart, 1880); A. Vogt, Geschichte der Stadt Rom (Berlin, 1888); Almanna de Gotha; J. H. Douglas, The Principal Noble Families of Rome (Rome, 1905).

MASSINGER, PHILIP (1583-1640), English dramatist, son of Arthur Massinger or Messanger, was baptized at St Thomas's, Salisbury, on the 24th of November 1583. He apparently belonged to an old Salisbury family, for the name occurs in the city records as early as 1475. He is described in his matriculation entry at St Alban Hall, Oxford (1602), as the son of a gentleman. His father, who had also been educated at St Alban Hall, was a member of parliament, and was attached to the household of Henry Herbert, 2nd earl of Pembroke, who recommended him in 1587 for the office of examiner in the court of the marches. The 3rd earl of Pembroke, the William Herbert whose name has been connected with Shakespeare's sonnets, succeeded to the title in 1601. It has been suggested that he supported the poet at Oxford, but the significant omission of any reference to him in any of Massinger's prefaces points to the contrary. Massinger left Oxford without a degree in 1606. His father had died in 1603, and he was perhaps dependent on his own exertions. The lack of a degree and the want of patronage from Lord Pembroke may both be explained on the supposition that he had become a Roman Catholic. On leaving the university he went to London to make his living as a dramatist, but his name cannot be definitely affixed to any play until fifteen years later, when The Virgin Martyr (ent. at Stationers' Hall, Dec. 7, 1611) appeared as the work of Massinger and Dekker. During these years he worked in collaboration with other dramatists. A joint letter, from Nathaniel Field, Robert Daborne and Philip Massinger, to Philip Henslowe, begs for an immediate loan of five pounds to release them from their "unfortunate extremity," the money to be taken from the balance due for the "play of Mr Fletcher's and ours." A second document shows that Massinger and Daborne owed Henslowe £5 on the 4th of July 1615. The earlier note probably dates from 1613, and from this time Massinger apparently worked regularly with John Fletcher, although in editions of Beaumont and Fletcher's works his co-operation is usually acknowledged. Sir Anthony Cokayne Massinger's constant friend and patron, refers in explicit terms to this collaboration in a sonnet addressed to Humphrey Moseley on the publication of his folio edition of Beaumont and Fletcher (Small Poems of Divers Sorts, 1658), and in an epigram on the two poets he says—"Plays they did write together, were great friends, And now one grave includes them in their ends." After Philip Henslowe's death in 1616 Massinger and Fletcher began to write for the King's Men. Between 1623 and 1626 Massinger produced unaided for the Lady Elizabeth's Men then playing at the Cockpit three pieces, The Parliament of Love, The Bondman and The Renegado. With the exception of these plays and The Great Duke of Florence, produced in 1627 by the Queen's servants, Massinger continued to write regularly for the King's Men until his death. The tone of the dedications of his later plays affords evidence of his continued poverty. Thus in the preface to The Maid of Honour (1632) he wrote, addressing Sir Francis Poljanme and Sir Thomas Bland: "I had not to this time sufficient, but that I was supported by your frequent courtesy and favours." The prologue to The Guardian (licensed 1633) refers to two unsuccessful plays and two years of silence, when the author feared he had lost the popular favour. S. R. Gardner, in an essay on "The Political Element in Massinger" (Contemp. Review, Aug. 1876), maintained that Massinger's dramas are before all else political, that the events of his day were as openly criticized in his plays as current politics are in the cartoons of Punch. It is probable that this break in his production was owing to his free handling of public matters. In 1631 Sir Henry Herbert, the master of the revels, refused to license an unnamed play by Massinger because of "dangerous matter as the deposing of Sebastian, King of Portugal," calculated presumably to endanger good relations between England and Spain. There is little doubt that this was the same piece as Belsee as You List, in which time and place are changed, Antiochus being substituted for Sebastian, and Rome for Spain. In the prologue Massinger ironically apologizes for his ignorance of history, saying: "at fault if his picture comes near a late and sad example." The obvious "late and sad example" of a wandering prince could be no other than Charles I.'s brother-in-law, the elector palatine. An allusion to the same subject may be traced in The Maid of Honour. In another play by Massinger, not extant, Charles I. is reported to have himself struck out a passage put into the mouth of Don Pedro, king of Spain, as "too insolent." The poet seems to have adhered closely to the politics of his patron, Philip Herbert, earl of Montgomery, and afterwards 4th earl of Pembroke, who had leanings to democracy and was a personal enemy of the duke of Buckingham. In The Bondman, dealing with the history of Timoleon, Buckingham is satirized as Gisco. The servility towards the Crown displayed in Beaumont and Fletcher's plays reflected the temper of the court of James I. The attitude of Massinger's heroes and heroines towards kings
is very different. Camiola's remarks on the limitations of the royal prerogative (Maid of Honour, act iv. sc. v.) could hardly be acceptable at court.

Massinger died suddenly at his house near the Globe theatre, and was buried in the churchyard of St Saviour's, Southwark, on the 18th of March 1640. In the entry in the parish register he is described as a "stranger," which, however, implies nothing more than that he belonged to another parish.

The supposition that Massinger was a Roman Catholic rests upon three of his plays, The Virgin Martyr (licensed 1620), The Renegado (licensed 1624) and The Maid of Honour (c. 1621). The religious sentiment is certainly such as would obviously best appeal to an audience sympathetic to Roman Catholic doctrine. The Virgin Martyr, in which Dekker probably had a large share, is really a miracle play, dealing with the martyrdom of Dorothea in the time of Diocletian, and the supernatural element is freely used. Little stress can be laid on this performance as elucidating Massinger's views. It is not entirely his work, and the story is early Christian, not Roman Catholic. In The Renegado, however, the action is dominated by the benediction influence of a Jesuit priest, Francois, and the doctrine of baptismal regeneration is enforced. In The Maid of Honour a complicated situation is solved by the decision of the heroine, Camiola, to take the veil. For this she is held up "as a posterity a fair example for noble maids to imitate." Among all Massinger's heroines Camiola is distinguished by genuine purity and heroism.

His plays have generally an obvious moral intention. He sets himself to work out a series of ethical problems through a succession of ingenious and effective plots. In the art of construction he has, indeed, few rivals. But the virtue of his heroes and heroines is rather morbid than natural, and often singularly divorced from common-sense. His dramatic personae are in general types rather than living persons, and their actions do not appear to spring inevitably from their characters, but rather from the exigencies of the plot. The heroes are too good, and the villains too wicked to be quite convincing. Moreover their respective goodness and villainy are too often represented as extraneous to themselves. This defect of characterization shows that English drama had already begun to decline.

It is certain that another Master was ever a popular playwright, for the best qualities of his plays would appeal rather to politicians and moralists than to the ordinary playgoer. He contributed, however, at least one great and popular character to the English stage. Sir Giles Overreach, in A New Way to Pay Old Debts, is a sort of commercial Richard III., a compound of the lion and the fox, and the part provides many opportunities for a great actor. He made another considerable contribution to the comedy of manners in The City Madam. In Massinger's own judgment The Roman Actor was "the most perfect birth of his Minerva." It is a study of the tyrant Domitian, and of the results of despotic rule on the despot himself and his court. Other favourable examples of his grave and restrained art are The Duke of Milan, The Bondman and The Great Duke of Florence.

Massinger was a student and follower of Shakespeare. The form of his verse, especially in the number of run-on lines, approximates in some respects to Shakespeare's later manner. He is rhetorical and picturesque, but rarely rises to extraordinary felicity. His verse is never mean, but it sometimes comes perilously near to prose, and in dealing with passionate situations it lacks fire and directness.

The plays attributed to Massinger alone are: The Duke of Milan, a Tragedy (c. 1618, pr. 1623, and 1638); The Unnatural Combat, a Tragedy (c. 1619, pr. 1639); The Bondman, an Ancient Stoic (licensed 1623, pr. 1624); The Renegado, a Tragedy (licensed 1624, pr. 1630); The Parliament of Love (lic. 1624; ascribed, no doubt erroneously, to the Stationers' Register, 1660, to W. Rowley; first printed by Gifford from an imperfect MS. in 1805); A New Way to Pay Old Debts, a Comedie (c. 1625, pr. 1632); The Roman Actor, a Tragedie (lic. 1625, pr. 1629); The Maid of Honour (dating perhaps from 1621, pr. 1632); The Picture, a Tragedomede (lic. 1629, pr. 1630); The Great Duke of Florence, a Comical Historie (lic. 1627, pr. 1635); The Emperor of the East, a Tragoomede (lic. and pr. 1631), founded on the story of Theodosius the Younger: Believe as You List (rejected by the censor in January, but licensed in May, 1631; pr. 1848-1849 for the Percy Society); The City Madam, a Comedy (lic. 1632, pr. 1658), which Mr Fleay (Bog. Chron. of the Eng. Drama, i. 226), however, contends to be a refactio of an older play, probably by Jonson, The Guardianess (lic. 1629, pr. 1632) and The Bashful Lover (lic. 1636, pr. 1655), A Very Woman, or The Prince of Tarent, licensed in 1634 as the work of Massinger alone, is generally referred to his collaboration with Fletcher. The "exquisite tragedies" of Massinger and his "justice and feeling"; first set in Swinburne, foreign to Fletcher's genius, and afford a striking example of Massinger's artistic skill and moderation.

Twelve plays of Massinger are said to be lost, but the titles of some may be recovered. The plays of those of these lost plays were MSS, used by John Warburton's cook for pie-covers. The numerous plays in which Massinger's co-operation with John Fletcher is generally assumed are dealt with under Beaumont and Fletcher. In 1625, 1630, 1631, 1632, 1638, 1640, and 1660, Massinger was also associated with Thomas Dekker. Some of these plays, which have been reconstructed, provide evidence that Massinger has constructed an ingenious case for the joint authorship by Fletcher and Massinger of the two "Shakespearean" plays, Henry VIII., and Two Noble Kinsmen (see the New Shakspere Society's Transac.

MASSON, DAVID—MAST

To save her from such humiliation he sent her poison, with which she destroyed herself. Massinissa was now accepted as a loyal ally of Rome, and was confirmed by Scipio in the possession of his kingdom. In the battle of Zama (202) (see Punic Wars), he commanded the cavalry on Scipio's right wing, and materially assisted the Roman victory. For his services he received the kingdom of Syphax, and thus under Roman protection he became master of the whole of Numidia, and his dominions completely enclosed the Carthaginian territories, now straitened and reduced at the close of the Second Punic War. It would seem that he had thoughts of annexing Carthage itself with the condescension of Rome. In a war which soon followed he was successful; the remonstrances of Carthage with Rome on the behaviour of her ally were answered by the appointment of Scipio as arbitrator; but, as though intentionally on the part of Rome, no definite settlement was arrived at, and thus the relations between Massinissa and the Carthaginians continued strained. Rome, it is certain, deliberately favoured her ally's unjust claims with the view of keeping Carthage weak, and Massinissa on his part was cunning enough to retain the friendship of the Roman people by helping them with liberal supplies in their wars against Perseus of Macedon and Antiochus. As soon as Carthage seemed to be recovering herself, and some of Massinissa's partisans were driven from the city into exile, his policy was to excite the fears of Rome, till at last in 149 war was declared—the Third Punic War, which ended in the final overthrow of Carthage. The king took some part in the negotiations which preceded the war, but died soon after its commencement in the nineteenth year of his age and the sixtieth of his reign.

Massinissa was an able ruler and a decided benefactor to Numidia. He converted a plundering tribe into a settled and civilized population, and out of robbers and marauders made efficient and disciplined soldiers. To his sons he bequeathed a well-stored treasury, a formidable army, and even a fleet. Cirta (q.v.), its capital, became a famous centre of Phoenician civilization. In fact Massinissa changed for the better the whole aspect of a great part of northern Africa. He had much of the Arab nature, was singularly temperate, and equal to any amount of fatigue. His fidelity to Rome was merely that of temporary expediency. He espoused now one side, and now the other, but on the whole supported Rome, so that orators and historians could speak of him as "a most faithful ally of the Roman people."

See Livy xxiv. 49, xxvii. 11, 35, 42, xxix. 27, xxx. 3, 12, 28, 37, xliii. 23, 29, xliii. 3; Polybius iii. 3, ix. 42, xiv. 1, xxii. 3, xxvii. 3; Appian, His. ab Pers. 3; Justin xxxiii. 1; A. H. J. Greenidge, Hist. of Rome (London [1909]).

MASSON, DAVID (1822-1907), Scottish man of letters, was born at Aberdeen on the 2nd of December 1822, and educated at the grammar school there and at Marischal College. Intending to enter the Church, he proceeded to Edinburgh University, where he studied theology under Dr Chalmers, whose friendship he enjoyed until the divine's death in 1847. However, abandoning his project of the ministry, he returned to his native city to undertake the editorship of the Banner, a weekly paper devoted to the advocacy of Free Kirk principles. After two years he resigned this post and went back to the capital, bent upon pursuing a purely literary career. There he wrote a great deal, contributing to Fraser's Magazine, Dublin University Magazine (in which appeared his essays on Chatterton) and other periodicals. In 1847 he went to London, where he found wider scope for his energy and knowledge. He was secretary (1849-51) of the Society of the Friends of Italy." In a famous interview with Mrs Browning at Florence he contested her admiration for Napoleon III. He had known De Quincey, whose biography he contributed in 1878 to the "English Men of Letters" series, and he was an enthusiastic friend and admirer of Carlyle. In 1852 he was appointed professor of English literature at University College, London, in succession to A. H. Clough, and from 1858 to 1865 he edited the newly established Macmillan's Magazine. In 1865 he was selected for the chair of rhetoric and English literature at Edinburgh, and during the early years of his professorship actively promoted the movement for the university education of women. In 1879 he became editor of the Register of the Scottish Privy Council, and in 1883 was appointed Historiographer Royal for Scotland. Two years later he resigned his professorship. His magnum opus in his Life of Milton in Connexion with the History of His Own Time in six volumes, the first of which appeared in 1858 and the last in 1880. He also edited the library edition of Milton's Poetical Works (3 vols., 1874), and De Quincey's Collected Works (14 vols., 1889-1890). Among his other publications are Essays, Biographical and Critical (1856, reprinted with additions, 3 vols., 1874), British Novelists and their Styles (1859), Drummond of Hawthornden (1873), Chatterton (1873) and Edinburgh Sketches (1892). He died on the 6th of October 1907. A bust of Masson was presented to the senate of the university of Edinburgh in 1897. Professor Masson had married Rosaline Orme. His son Orme Masson became professor of chemistry in the university of Melbourne, and his daughter Rosalie is known as a writer and novelist.

MASSON, LOUIS CLAUDE FREDÉRIC (1847— ), French historian, was born at Paris on the 8th of March 1847. His father, Francis Masson, a solicitor, was killed on the 23rd of June 1848, when major in the garde nationale. Young Masson was educated at the college of Sainte Barbe, and at the lycée Louis-le-Grand, and then travelled in Germany and in England; from 1869 to 1880 he was librarian at the Foreign Office. At first he devoted himself to the history of diplomacy, and published between 1877 and 1884 several volumes connected with that subject. Later he published a number of more or less curious memoirs illustrating the history of the Revolution and of the empire. But he is best known for his books connected with Napoleon. In Napoleon inconnu (1865), Masson, together with M. Guido Biagi, brought out the unpublished writings (1786-1793) of the future emperor. These were notes, extracts from historical, philosophical and literary books, and personal reflections in which one can watch the growth of the ideas later carried out by the emperor with modifications necessitated by the force of circumstances and his own genius. But this was only one in a remarkable series: Joséphine de Beauharnais, 1773-1796 (1808); Joséphine, impératrice et reine (1869); Joséphine répudiée 1809-1814 (1901); L'Imperatrice Marie Louise (1902); Napoléon et les femmes (1894); Napoléon et sa famille (9 vols., 1897-1907); Napoléon et son fils (1904); and Auteur de l'Ère d'Elbe (1908). These works abound in details and amusing anecdotes, which throw much light on the events and men of the time, holding a mixed of the personal, romantic and dramatic aspects of his life. The author was made a member of the Académie française in 1903. From 1886 to 1889 he edited the review Arts et Lettres, published in London and New York.

A bibliography of his works, including anonymous ones and those under an assumed name, has been published by G. Vicaire (Manuel de l'amateur des livres du XIXe siècle, tome v., 1904). Napoléon et les femmes has been translated into English as Napoleon and the Fair Sex (1894).

MAST (1) (O. Eng. maest; a common Teutonic word, cognate with Lat. malus; from the medieval latinized form mastus comes Fr. mal), in nautical language, the name of the spar, or straight piece of timber, or combination of spars, on which are hung the yards and sails of a vessel of any size. It has been ingeniously supposed that man himself was the first mast. He discovered by standing up in his prehistoric " dugout," or canoe, that the wind blowing on him would carry his craft along. But the mast, that is to say, the central post made the improvement the charters the mast into the mast itself. The earliest ships had only one, carrying a single sail. So little is known of the rigging of
A "jury mast" is a temporary mast put up by the crew when the spars have been carried away in a storm or in action, or have been cut away to relieve pressure in a storm. The word has not been supposed without any foundation to be short for "jury mast"; it may be a fanciful sailor adaptation of "jury" in some connection now lost. Skeat suggests that it is short for O. Fr. *ajour*, lat. *adjudire*, to aid. There is no reason to connect with *jour*, day.

**Mast** *(Anglo-Saxon *maest*, food, common to some Teutonic languages, and ultimately connected with "meat"), the fruit of the beeck, oak, and other forest trees, used as food for swine.

**Mastaba** *(Arab. for "bench"), in Egyptian architecture, the term given to the rectangular tombs in stone with raking sides and a flat roof. There were three chambers inside. In one the walls were sometimes richly decorated with paintings and had a low bench of stone in which incense was burnt. The second chamber was either closed, with holes pierced in the wall separating it from the first chamber, or entered through a doorway into the third chamber. This innermost room was sometimes passed through this chamber contained the *serab* or figure of the deceased. A vertical well-hole cut in the rock descended to a third chamber in which the mummy was laid.

**Master** *(Lat. *magister*, related to *magis*, more, as the corresponding minister is to minus, less; the English form is due partly to the O. Eng. *maister*, and partly to O. Fr. *maistre*, mod. *maître*; cf. Du. *meester*, Ger. *Meister*, Ital. *maestro*), one holding a position of authority, disposition or control over persons or things. The various applications of the word fall roughly into the following main divisions; as the title of the holder of a position of command or authority; as that of the holder of certain public or private offices, and hence a title of address; as implying the relationship of a teacher to his pupils or of an employer to the persons he employs. As a title of the holder of an office, the use of the Lat. *magister* is very ancient. *Magister* *equitum*, master of the horse, goes back to the early history of the Roman Republic (see *Dictator*; and for the British office, *Master of the Horse*). In medieval times the name of the holder of the office of the *glossarius* (see above) was *magister*; the modern English *glossary* is derived from this source; and the article *glossator* contains over 120 sub-headings. British royal household most of the offices bearing this title are now obsolete. Of the greater offices, that of master of the buckhounds was abolished by the Civil List Act 1901. The master of the household, master of the ceremonies, master of the king's music still survive. Since 1870 the office of master of the mint has been held by the chancellor of the exchequer, all the administrative and other duties being exercised by the deputy master.

At sea, a "master" is more properly styled "master mariner." In the merchant service he is the commander of a ship, and is by courtesy known as the captain. In the British navy he was the officer entrusted with the navigation under the captain. He had no royal commission, but a warrant from the Board of Navy. Very often he had been a merchant captain. His duties are now performed by the staff commander or navigating lieutenant. The master-at-arms is the head of the internal police of a ship; the same title is borne by a senior gymnastic instructor. In the Seamen's Dictionary (London, 1696), the master is a commissioned officer below the rank of lieutenant.

"Master" appears as the title of many legal functionaries (for the masters of the supreme court see Chancery; and King's Bench, Court of; for masters in lunacy see Insanity: § Law; see also *Master of the Rolls*, below). The "master of the faculties" is the chief officer of the archbishop of Canterbury in his court of faculties. His duties are concerned with the appointment of notaries and the granting of special licences of marriage. The duties are performed ex officio by the judge of the provincial courts of Canterbury and York, who is also dean of Arches, in accordance with § 7 of the Public Worship Act.
Regulation Act 1874. The “master of the Temple” is the title of the priest-in-charge of the Temple Church in London. It was formerly the title of the grand master of the Knights Templars. The priest-in-charge of the Templars’ Church was properly styled the custos, and this was preserved by the Knights Hospitallers when they were granted the property of the Templars at the dissolution of that order. The act of 1540 (32 Henry VIII.), which dissolved the order of the Hospitallers, wrongly styled the custos master of the Temple, and the mistake has been continued. The proper title of a bencher of the Inns of Court is “master of the Bench” (see INNS OF COURT). The title of “Master-General of the Ordnance” was revived in 1904 for the head of the Ordnance Department in the British military administration.

“Master” is the ordinary word for a teacher, very generally used in the compound “schoolmaster.” The word also is used in a sense transferred from this to express the relation between the founder of a school of religion, philosophy, science, art, &c., and his disciples. It is partly in this sense and partly in that of one whose work serves as a model or type of superlative excellence that such terms as “old masters” are used. In medieval universities magister was particularly applied to one who had been granted a degree carrying with it the licentia docendi, the licence to teach. In English usage this survives in the faculty of arts. The degree is that of artem magister, master of arts, abbreviated M.A. In the other faculties the corresponding degree is doctor. Some British universities give a master’s degree in surgery, magister chirurgiae, C.M. or M.Ch., and also in science, magister scientiae, M.Sc. The academic use of “master” as the title of the head of certain colleges at the universities of Oxford and Cambridge is to be referred to the frequent application of the term to the holder of a presiding office in an institution.

Master was the usual prefix of address to a man’s name, though originally confided to members of some social standing. Probably under the influence of “mistress,” it was corrupted in sound to “mister,” and was abbreviated to “Mr.” In the case of the puisne judges of the High Court “Mr Justice” is still used as the proper official form of written address. The Speaker of the House of Commons is also formally addressed as “Mr Speaker.” In some Scottish peerages below the rank of earl, “master” is used in the courtesy title of the heir, e.g. the “Master of Ruthven.”

MASTER AND SERVANT. These are scarcely to be considered as technical terms in English law. The relationship which they imply is created when one man hires the labour of another for a term. Thus it is not constituted by merely contracting with another for the performance of a definite work, or by sending an article to an artificer to be repaired, or engaging a builder to construct a house. Nor would the employment of a man for one definite act of personal service—e.g. the engagement of a man for a single day—generally make the one master and the other servant. It was held, however, in relation to the offence of embezzlement, that a drover employed on one occasion to drive cattle home from market was a servant within the statute. On the other hand, there are many decisions limiting the meaning of “servants” under wills giving legacies to the class of servants generally. Thus “a person who was not obliged to give his whole time to the master, but was yet in some sense a servant,” was held not entitled to share in a legacy to the servants. These cases are, however, interpretations of wills where the intention obviously is to benefit domestic servants only. And so in other connexions questions may arise as to the exact nature of the relations between the parties—whether master and servant, or principal and agent, or landlord and tenant, or partners, &c.

The terms of the contract of service are for the most part such as the parties choose to make them, but in the absence of an express or implied law the contract, in the case of a domestic servant, is limited to a year. But in the case of domestic and menial servants there is a well-known rule, founded solely on custom, that their contract of service may be determined at any time by giving a month’s warning or paying a month’s wages, but a domestic or other yearly servant, wrongfully quitting his master’s service, forfeits all claim to wages for that part of the current year during which he has served, and cannot claim the sum to which his wages would have amounted had he kept his contract, merely -detracting therefrom one month’s wages. Domestic servants have a right by custom to leave their situations at any time on payment of a calendar month’s wages in advance, just as a master may discharge them in a similar manner (Manley Smith’s Law of Master and Servant, chs. ii. and iii.). The following are sufficient grounds for discharging a servant: (1) wilful disobedience of any lawful order; (2) gross moral misconduct; (3) habitual negligence; (4) incompetence or permanent disability caused by illness. A master has a right of action against any person who deprives him of the services of his servant, by enticing him away, harbouring or detaining him after notice, confining or disabling him, or by seducing his female servant. Indeed, the ordinary and only available action for seduction in English law is in form of a claim by a parent for the loss of his daughter’s services. The death of either master or servant in general puts an end to the contract. A servant wrongfully discharged may either treat the contract as rescinded and sue for services actually rendered, or he may bring a special action for damages for the breach. The common law liabilities of a master towards his servants have been further regulated by the Workmen’s Compensation Acts (see EMPLOYER’S LIABILITY). A master is bound to provide food for a servant living under his roof, and wilful breach of duty in that respect is a misdemeanour under the Offences against the Person Act 1861.

A servant has no right to demand “a character” from an employer, and if a character be given it will be deemed a privileged communication, so that the master will not be liable thereon to the servant unless it be false and malicious. A master by knowingly giving a false character of a servant to an intending employer may render himself liable—should the servant for example rob or injure his new master.

Reference may be made to the articles on LABOUR LEGISLATION for the cases in which special terms have been introduced into contracts of service by statute (e.g. Truck Acts).

MASTER OF THE HORSE, in England, an important official of the sovereign’s household. The master of the horse is the third dignitary of the court, and is always a member of the ministry (before 1782 the office was of cabinet rank), a peer and a privy councillor. All matters connected with the horses and hounds of the sovereign, as well as the stables and coach-houses, the studs, mews and kennels, are within his jurisdiction. The practical management of the royal stables and stud devolves on the chief or crown equerry, formerly called the gentleman of the horse, who is never in personal attendance on the sovereign and whose appointment is permanent. The clerk marshal has the general superintendence of the department before the sovereign is engaged, and is in waiting on the sovereign on state occasions only. Exclusive of the crown equerry there are seven regular equerries, besides extra and honorary equerries, one of whom is always in attendance on the sovereign and rides at the side of the royal carriage. They are always officers of the army, and each of them is “on duty” for about the same time as the lords and grooms in waiting. There are also several pages of honour in the master of the horse’s department, who must not be confounded with the pages of various kinds who are in the department of the lord chamberlain. They are youths aged from twelve to sixteen, selected by the sovereign in person, to attend on him at state ceremonies, when two of them, arrayed in an antique costume, assist the groom of the stole in carrying the royal train.

In France the master of the horse (“Grand Écuyer,” or more usually “Monsieur le Grand”) was one of the seven great officers of the crown from 1617. As well as the superintendence of the royal
ARCHIPELAGO, the production of the substance has been, since the time of Dioscorides, almost exclusively confined to the island of Chios. The mastic districts of that island are for the most part flat and stony, with little hills and few streams. The shrubs are about 6 ft. high. The resin is contained in the bark and not in the wood, and in order to obtain it numerous vertical incisions are made, during June, July and August, in the stem and chief branches. The resin speedily exudes and hardens into roundish or oval tears, which are collected, after about fifteen days, by women and children in little baskets lined with white paper or cotton wool. The ground around the trees is kept hard and clean, and flat pieces of stone are often laid beneath them to prevent any droppings of resin from becoming contaminated with dirt. The collection is repeated three or four times between June and September, a fine tree being found to yield about 8 or 10 lb of mastic during the season. Besides that obtained from the incisions, mastic of very fine quality spontaneously exudes from the small branches. The harvest is affected by showers of rain during the period of collection, and the trees are much injured by frost, which is, however, of rare occurrence in the districts where they grow. Mastic occurs in commerce in the form of roundish tears about the size of pebbles, and of a transparent, with a glassy fracture, of a pale yellow or faint greenish tinge, which increases with age. During the 15th, 16th and 17th centuries mastic enjoyed a high reputation as a medicine, and formed an ingredient in a large number of medical compounds; but its use in medicine is now obsolete, and it is chiefly employed for making varnish.

Pistacia Khinjuk and P. cabulica, trees growing throughout Sind, Baluchistan and Cabul, yield a kind of mastic which is met with in the Indian bazaars under the name of Masticium, i.e. Roman mastick. The mastick obtained in the European market is known as East Indian or Bombay mastick. In Algeria P. Atlantica yields a solid resin, which is collected and used by the Arabs as a masticatory. Cape mastick is the produce of Euryops multifoldus, the resin bush, or harpuris bosch of the Boers—a plant of the composite order growing abundantly in the Clanwilliam district. Damms mastick is sometimes sold under the name of mastic. The West Indian mastic tree is the Bursera gymnifera and the Peruvian mastick is Schinus molle; but neither of these furnish commercial resins. The name mastick is also applied to a timber tree, Styer oxdon mastichodendron, nat. ord. Sapotiaceae, which grows in the West Indies and on the coast of Florida.

MASTIGOPHORA, a group of Protozoa, moving and ingesting food by long flagella (Gr. μαστίγιον, whip), usually few in number, and multiplying by fission, usually longitudinal, in the active condition. They were separated off from the rest of the old "Infusoria" by K. Düssing, and subdivided by O. Bütschli and E. R. Lankster into (1) Flagellata (q.v.), including Haemogloflagellata (q.v.), (2) Dinoflagellata (q.v.) and Rhyhcoflagellata E. Haeckel (q.v.)=Rhynchoflagellata E. R. Lankster. The Mastigophora are frequently termed Flagellata or Flagellates.

MASTODON (Gr. μαστός, breast, δόλος, tooth), a name given by Cuvier to the Pliocene and Miocene forerunners of the elephants, on account of the nipple-like prominences on the molar teeth of some of the species (fig. 2), which are of a much simpler type than those of true elephants. Mastodonts, like elephants, always have a pair of upper tusks, while the earlier forms likewise have a short pair in the lower jaw, which is probably a vestige of the hypothymys for their support. These long-chinned mastodonts are now regarded as forming a genus by themselves (Tetrabelodon), well-known examples of this group being Tetrabelodon angustidens from the Miocene and T. longirostris (fig. 1 C.) from the Lower Pliocene of the Continent. In the former the upper tusks are bent down so as to cross the tips of the short and chisel-like lower pair. These long-chinned mastodonts must have had an extremely elongated muzzle, formed by the upper lip and nose above and the lower lips below, with which they were able to reach the ground, the neck being probably rather longer than in elephants. On the other hand, in the short-chinned mastodonts, as represented by the Pleistocene North American Mastodon americanus and the Pliocene European M. turicensis (fig. 1), the chin had shrunk
to the dimensions characteristic of elephants, with the loss of the lower incisors (or with temporary retention of rudimentary ones), while at the same time a true elephant-like trunk must have been developed by the shortening of the lower lip and the prolongation of the combined upper lip and nose.

Mastodonts are found in almost all parts of the world. In Asia they gave rise to the elephants, while they themselves originated in Africa from unungulates of more normal type. (See Proboscidea.)

The upper tusks of the early mastodons differ from those of elephants in retaining longitudinal bands of enamel. The molar teeth are six in number on each side, increasing in size from before backwards, and, as in the elephants, with a horizontal succession, the anterior teeth being lost before the full development of the posterior ones, which gradually move forward, taking the place of those that are destroyed by wear. This process is, however, less fully developed than in elephants, and as many as three teeth may be in place in each jaw at one time. There is, moreover, in many species a vertical succession, affecting either the third or the third and second, or (in one American species, *Tetralodont produs*) the first, second, and third of the six molar teeth. These three are therefore reckoned as milk-molars, and their successors as premolars, while the last three correspond to the true molars of other mammals. The mode of succession of the teeth in the mastodons exhibits so many stages of the process by which the dentition of elephants has been derived from that of more ordinary mammals. It also shows that the anterior molars of elephants do not correspond to the premolars of other ungulates, but to the milk-molars, the early loss of which in consequence of the peculiar process of horizontal forward-moving

**Fig. 1.—Mastodon turicensis (Pliocene).**

and went in the following year to Multan and Manṣūra, thence to Cambay, Saïmūr and Ceylon, to Madagascar and back to Oman. He seems about this time to have been as far as China. After a visit to the shores of the Caspian Sea he visited Tiberias in Palestine, examined the Christian church there, and described its relics. In 943 he was in Antioch, studying the ruins, and two years later in Damascus. The last ten years of his life he spent in Syria and Egypt. His great object in life had been to study with his own eyes the peculiarities of every land and to collect whatever was of interest for archaeology, history and manners. Himself a Mo‘tāzillī (see Mahomedan Religion: Sects), he was singularly free from bigotry, and took his information, when necessary, from Persians, Jews, Indians, and even the chronicler of a Christian bishop.

His most extensive work was the Kitāb ḥabār wa-zamān or Annals, in 30 volumes with a supplement, the Kitāb al-‘Abṣāl, a chronological sketch of general history. Of these the first part only of the former is extant in MS. in Vienna, while the latter seems to be in the Bodleian Library, also in MS. The substance of the two was united by him in the work by which he is now best known, the *Ma‘ṣūdī‘i Book of *Tābrīzi wa-Maṣ‘ūdī‘i* ("Meidences of Precious Stones"), an historical work which he completed in 947. In 956 he finished a second edition of this and made it double its former size, but no copy of this seems to be extant. The original edition has been published at Bâlûq and Cairo, with French translation by C. Barbier de Meynard and Pavet de Courteille (9 vols., Paris, 1861–1877). Another work of Mas‘ūdī, written in the last year of his life, is the Kitāb wa-Tanbīh waš-‘Iṣlaf ("The Book of Indication and Revision"), in which he summarizes the course of his life and corrects and completes his former writings. It has been edited by M. J. de Goeje (Leiden, 1894), and a French translation has been made by Carta de Vaux (Paris, 1896); cf. also the memoir of S. de Sacy published in Meynard’s *Ma‘ṣūdī‘i*, pp. 144–145 (Weimar, 1898). C. Field’s *Tales of the Caliphs* is nearly based on Mas‘ūdī.

**Fig. 2.—Upper Molar of *Mastodon arvensis*, viewed from below.**
Succession does not require their replacement by premolars. Specialized species like *Mastodon americanus* have completely lost the rudimentary premolars.

Mastodonts have fewer ridges on their molar teeth than elephants; the ridges are also less elevated, wider apart, with a thicker enamel covering, and scarcely any cement filling the space between them. Sometimes (as in *M. americanus*) the ridges are simple transverse wedge-shaped elevations, with straight or concave edges. In other species the summits of the ridges are divided into conical cusps, and may have accessory cusps clustering around them (as in *M. arvensis*, fig. 2). When the summits of these are worn by mastication their surfaces present circles of dentine surrounded by a border of enamel, and as attrition proceeds different patterns are produced by the erosion of the bases of the cusps, a trefoil form being characteristic of some species.

Certain of the molar teeth of the middle of the series in both elephants and mastodonts have the same number of principal ridges; those in front having fewer, and those behind a greater number. These teeth are distinguished as "intermediate" molars. In elephants there are only two, the last milk-molar and the first true molar (or the third and fourth of the whole series), which are alike in the number of ridges; whereas in mastodonts there are three such teeth, the last milk-molar and the first and second molars (or the third, fourth and fifth of the whole series). In elephants the number of ridges on the intermediate molars always exceeds five, but in mastodonts it is always three or four, and the tooth in front has usually one fewer and that behind one more than the ridge-formula (i.e. a formula expressing the number of ridges on each of the six molar teeth) of mastodonts can be reduced either to 1, 2, 3, 3, 4, or 2, 3, 4, 4, 5. Three-ridged and four-ridged types occur both in *Mastodon* and *Tetralodont*. (R. L.)

**MAS‘ŪDĪ (Abū-l Ḥasan 'Alī ibn Ḥusain ibn ‘Alī ul-Maṣ‘ūdī) (d. c. 956),** Arabic historian, was born at Bagdad towards the close of the 9th century. Much of his life was spent in travel. After he had been in Persia and Kerman, he visited Isfahān in 947, and returned always three or four, and the tooth in front has usually one fewer and that behind one more than the ridge-formula (i.e. a formula expressing the number of ridges on each of the six molar teeth) of mastodonts can be reduced either to 1, 2, 3, 3, 4, or 2, 3, 4, 4, 5. Three-ridged and four-ridged types occur both in *Mastodon* and *Tetralodont*. (R. L.)

*MAŠ‘UDI* (Abū-l Ḥasan ‘Alī ibn Ḥusain ibn ‘Alī ul-Maṣ‘ūdī) (d. c. 956), Arabic historian, was born at Bagdad towards the close of the 9th century. Much of his life was spent in travel. After he had been in Persia and Kerman, he visited Isfahān in 947, and returned always three or four, and the tooth in front has usually one fewer and that behind one more than the ridge-formula (i.e. a formula expressing the number of ridges on each of the six molar teeth) of mastodonts can be reduced either to 1, 2, 3, 3, 4, or 2, 3, 4, 4, 5. Three-ridged and four-ridged types occur both in *Mastodon* and *Tetralodont*. (R. L.)

In 956 he finished a second edition of this and made it double its former size, but no copy of this seems to be extant. The original edition has been published at Bâlûq and Cairo, with French translation by C. Barbier de Meynard and Pavet de Courteille (9 vols., Paris, 1861–1877). Another work of Mas‘ūdī, written in the last year of his life, is the Kitāb wa-Tanbīh wa-‘Iṣlaf ("The Book of Indication and Revision"), in which he summarizes the course of his life and corrects and completes his former writings. It has been edited by M. J. de Goeje (Leiden, 1894), and a French translation has been made by Carta de Vaux (Paris, 1896); cf. also the memoir of S. de Sacy published in Meynard’s *Ma‘ṣūdī‘i*, pp. 144–145 (Weimar, 1898). C. Field’s *Tales of the Caliphs* is nearly based on Mas‘ūdī.

An account of Mas‘ūdī’s works is to be found in de Sacy’s memoir and in Goeje’s preface to his edition of the *Tanbīh*, and of the works extant in C. Brockelmann’s Gesch. der Arabischen Literatur, 1, 144–145 (Weimar, 1898). C. Field’s *Tales of the Caliphs* is nearly based on Mas‘ūdī.
MASULIPATAM, or BANDAR, a seaport of British India, administrative headquarters of the Kistna district of Madras, on one of the mouths of the river Kistna, 215 m. N. of Madras city. Pop. (1907), 39,507. Masulipatam was the earliest English settlement on the Coromandel coast, its importance being due to the fact that it was the bandar or port of Golconda. An agency was established there in 1611. During the wars of the Carnatic, the English were temporarily expelled the town, which was held by the French for some years. In 1759 the town and fort were carried by storm by Colonel Forde, an achievement followed by the acquisition of the Northern Circars (q.v.). In 1864 a great storm-wave swept over the entire town and is said to have destroyed 30,000 lives. Weavers form a large portion of the inhabitants, though their trade has greatly declined since the beginning of the 19th century. Their operations, besides weaving, include printing, bleaching washing and dressing. In former days the chintzes of Masulipatam had a great reputation abroad for the freshness and permanency of their dyes. Masulipatam is a station of the Church Missionary Society. The port is only a roadstead, where vessels anchor 5 m. out. A branch line from Bezawada on the Southern Mahratta railway was opened in 1877, and the chief educational institution is a Native College for the C.M.S.

MAT (O. Eng. meat, from late Lat. matula, whence Ital. matola, Ger. and Dan. matte, Du. mat, &c.), an article of various sizes and shapes, according to the purpose for which it is intended, and made of plaited or woven materials, such as coir, hemp, coco-nut fibre, straw, rushes, &c., or of rope or coarse twine. The finer fabrics are known as "matting" (q.v.). Mats are mainly used for covering floors, or in horticulture as a protection against cold or exposure for plants and trees. When used near the entrance to a house for people to wipe their boots on "door mats" are usually made of coarse coco-nut fibre, orindia-rubber, cork, or of thickly coiled wire. Bags, rolls or sacks made of matting are used to hold coffee, flax, rice and other produce, and the term is often used with reference to the specific quantities of such produce, e.g. so many "mats" of coffee, rice, &c.

To be distinguished from the above is the term "mat" in glass-painting or gilding, meaning dull, unpollished or unburnished. This is the same as Ger. matt, dead, dull, cf. mati-bux, Mod. Lat. matus, adapted from Persian mášt, dazed, astonished, at a loss, helpless, and seen in "mate" in chess, from Pers. šahá mášt the king is dead.

MATABELE ("vanishing" or "hidden" people, so called from their appearance in battle, hidden behind enormous oxhide shields), a people of Zulu origin who began national life under the chief Mosilikatze. Driven out of the Transvaal by the Boers in 1837, Mosilikatze crossed the Limpopo with a military host which had been recruited from every tribe conquered by him during his ten years' predominance in the Transvaal. In their new territories the Matabele absorbed into their ranks many members of the conquered Mashona tribes and established a military despotism. Their sole occupation was war, for which their laws and organization were designed to fit them. This system of constant warfare is, since the conquest of Matabeleland by the British in 1893, a thing of the past. The Matabele are now herdsmen and agriculturists. (See RHODESIA.)

MATACHINES (Span. matachín, clown, or masked dancer), bands of mummers or itinerant players in Mexico, especially popular around the Rio Grande, who wander from village to village during Lent, playing in rough-and-ready style a set of pantomimes on the history of Montezuma. Dressed in fantastic Indian costumes and carrying rattles as their orchestra, the chief characters are El Monarca "the monarch" (Montezuma); Malinche, or Malintzin, the Indian mistress of Hernando Cortes; El Toro, "the bull," the malevolent "comic man" of the play, dressed in buffalo skin with the animal's horns on his head; Agüelo, the "grandfather," and Agüela, "grandmother." With the help of a chorus of dancers they portray the desertion of his people by Montezuma, the luring of him back by the wiles and smiles of Malinche, the final reunion of king and people, and the killing of El Toro, who is supposed to have made all the mischief.

MATADOR, a Spanish word meaning literally "killer," from matar, Lat. mactare, especially applied to the principal performer in a bull-fight, whose function it is to slay the bull (see Bull-fighting). The word is also used of certain important cards in such games as quadrille, ombre, &c., and more particularly of a special form of the game of dominoes.

MATAMOROS, a town and port of the state of Tamaulipas, Mexico, on the S. bank of the Rio Grande, 28 m. from its mouth, opposite Brownsville, Texas. Pop. (1900), 3847. Matamoros stands in an open plain, the commercial centre for a large district, but its import trade is prejudiced by the bar at the mouth of the Rio Grande, which permits the entrance of small vessels only. The exports include hides, wool and live stock. The importance of the town in the foreign trade of northern Mexico, however, has been largely diminished by the great railways. Formerly it was the centre of a large contra-band trade with Brownsville, Texas. Matamoros was founded early in the 19th century, and was named in honour of the Mexican patriot Mariano Matamoros (c. 1770–1814). In the war between the United States and Mexico, Matamoros was easily taken by the Americans on the 18th of May 1846, following the fall of the fort at Matamoros, and the battle of Resaca de la Palma. Matamoros was occupied by the Mexican imperialists under Mejia in 1864, and by the French in 1866.

MATANZAS, an important city of Cuba, capital of Matanzas Province, situated on a large deep bay on the N. coast, about 54 m. (by rail) E. of Havana. Pop. (1907), 36,009. There are railway outlets W., S. and E., and Matanzas is served by steamships to New York and by the coast steamers of the Herrera Line. The bay, unlike all the other better harbours of the island, has a broad mouth, 2 m. across, but there is good shelter against all winds except from the N.E. A coral reef lies across the entrance. Three rivers emptying into the bay—the San Juan, Canimar and Yumuri—have deposited much silt, necessitating the use of lighters in loading and unloading large ships. The city is finely placed at the head of the bay, on a low, sloping plain backed by wooded hills, over some of which the city itself has spread. The conical Pán de Matanzas (1277 ft.) is a striking land-mark for sailors. The San Juan and Yumuri rivers divide Matanzas into three districts. The Teatro Esteban, Casino Español and Hotel Agramonte are noteworthy among the buildings. The broad Paseo de Marti (Alameda de las Palmas, Paseo de Santa Cristina) extends along the edge of the harbour, and is perhaps the handsomest parkway and boulevard in Cuba. At one end is a statue of Ferdinand VII., at the other a monument to 63 Cubans executed by the Spanish Government as traitors for bearing arms in the cause of independence. A splendid military road continues the Paseo to the Castillo de San Servierno (built in 1604-1605, reconstructed in 1773 and following years). There are two smaller forts, established in the 18th century. Near Matanzas are two of the most noted natural resorts of Cuba: the valley of the Yumuri, and the caves of Bellamar. Commanding the Yumuri Valley is the hill called Cumbre, on which is the Hermitage of Montecerrate (1870), with a famous shrine. Matanzas is the second port of the island in commerce. Sugar and molasses are the chief exports. The city is the chief outlet for the sugar product of the province, which, with the province of Santa Clara, produces two-thirds of the crop of the island. There are many large warehouses, rum distilleries, sugar-mills and railway machine-shops. Matanzas is frequently mentioned in American literature in the 19th century as being the haunt of buccaneers; but the city was not laid out until 1693. In the next year it received an ayuntamiento (council). Its prosperity rapidly increased after the establishment of free commerce early in the 19th century. In 1815 it was made a department capital. The mulatto poet, Gabriel de la Concepción Valdés, known as Plácido (1809–1844), was born in Matanzas, and was executed there for participation in the supposed conspiracy of negroes in 1844, which is one of the most famous episodes in Cuban history. The hurricanes of 1844 and 1846 are the only other prominent local events. American commercial influence has always been particularly strong.
MATARÓ—MATCH

MATARÓ (anc. Iluro), a seaport of north-eastern Spain, in the province of Barcelona, on the Mediterranean Sea and the Barcelona-Perpignan railway. Pop. (1900), 19,704. The streets of the new town, lying next the sea, are wide and regularly built; those of the old town, farther up the hill, still preserve much of their ancient character. The parish church of Santa Maria has some good pictures and wood carvings. The wine of the neighbourhood, which resembles port, is shipped in large quantities from Barcelona; and the district furnishes fine roses and strawberries for the Barcelona market. The leading industries are manufactures of linen and cotton goods, especially canvas and tarpaulin, and of soap, paper, chemicals, starch, glass, leather, spirits and flour. The railway to Barcelona, opened in October 1848, was the first to be constructed in Spain. Outside the town is the much-frequented carbonated mineral spring of Argentona.

MATCH: 1. O. Eng. gemæcca, a cognate form of "make," meaning originally "fit" or "suitable"; a pair, or one of a pair of objects, persons or animals. As particularly applied to a husband and wife, and hence to a marriage, the word is especially used of two persons or things which correspond exactly to each other. The verb "match" has also the meaning of "pit one against each other," and so is applied in sport to an arranged contest between teams or individuals.

2. O. Fr. mesche; apparently from a latinized form of Gr. μίκη, mucus from the nose, applied to the nozzle of a lamp; primarily the wick which conveys oil or molten wax to the flame of a lamp or candle (this use is now obsolete), the word being then applied to various objects having the property of carrying fire. With early firearms a match, consisting of a cord of hemp or similar material treated with nitre and other substances so that it continued to smoulder after it had been ignited, was used for firing the charge, being either held in the gunner's hand or attached to thecock of the musket or arquebus and brought down by the action of the trigger on the powderpriming ("matchlock"); and more or less similar preparations, made to burn more or less rapidly as required ("quick-match" and "slow-match"), are employed as fuses in blasting and demolition work in military operations. The word "match" was more widely used of a splint of wood, tipped with sulphur so that it would readily ignite, but it now more commonly means a slip of wood or other combustible material, having its end covered with composition which takes fire when rubbed either on any rough surface or on another specially prepared composition.

The first attempt to make matches in the modern sense may probably be ascribed to Godfrey Haukwitz, who, in 1680, acting under the direction of Robert Boyle, who at that time had just discovered how to prepare phosphorus, employed small pieces of that element, ignited by friction, to light splints of wood dipped in sulphur. This device, however, did not come into extensive use owing to its danger and inconvenience and to the cost of the phosphorus, and till the beginning of the 19th century flint and steel with tinder-box and sulphur-tipped splints of wood—"spunks" or matches—were the common means of obtaining fire for domestic and other purposes. The sparks struck off by the percussion of flint and steel were made to fall among the tinder, which consisted of carbonized fragments of cotton and linen; the entire mass of the tinder was set into a glass, developing sufficient heat to ignite the sulphur with which the matches were tipped, and thereby the splints themselves were set on fire. In 1805 one Chancel, assistant to Professor L. J. Thénard of Paris, introduced an apparatus consisting of a small bottle containing asbestos, saturated with strong sulphuric acid, with splints or matches coated with sulphur, and tipped with a mixture of chloride of potash and sugar. The matches so prepared, when brought into contact with the sulphuric acid in the bottle, ignited, and thus, by chemical action, fire was produced. In 1823 a decided impetus was given to the artificial production of fire by the introduction of the Döbereiner lamp, so called after its inventor, J. W. Döbereiner of Jena. The first really practical friction matches were made in England in 1827, by John Walker, a druggist of Stockton-on-Tees. These were known as "Congreves" after Sir William Congreve, the inventor of the Congreve rocket, and consisted of wooden splints or sticks of cardboard coated with sulphur and tipped with a mixture of sulphide of antimony, chlorate of potash and gum. With each box which was retailed at a shilling, there was supplied a folded piece of glass paper, the folds of which were to be tightly pressed together, while the match was drawn through between them. The same idea occurred to Sir Isaac Wollam independently two years later and a half years later. The so-called "Prometheus Box," patented by S. Jones of London in 1830, consisted of a short roll of paper with a small quantity of a mixture of chlorate of potash and sugar at one end, a thin glass globule of strong sulphuric acid being attached at the same point. When the sulphuric acid was liberated by pinching the glass globule, it acted on the mixed chlorate and sugar, producing fire. The phosphorus friction-match of the present day was first introduced on a commercial scale in 1833. It appears to have been made almost simultaneously in several distinct centres. The name most prominently connected with the early stages of the invention is that of J. Presch of Vienna, who in 1833 had a factory in operation for making phosphorus matches, fuses, and amadou slips tipped with igniting composition. At the same time also matches were being made by F. Moldenhauer in Darmstadt; and for a long series of years Austria and the South-German states were the principal centres of this new industry.

But the use of ordinary white or yellow phosphorus as a principal ingredient in the igniting mixture of matches was found to be accompanied with very serious disadvantages. It is a deadly poison, and its free dissemination has led to many accidental deaths, and to numerous cases of wilful murder and suicide. Workers also who are exposed to phosphoric vapours are subject to a peculiarly distressing disease which attacks the jaw, and ultimately produces necrosis of the jaw-bone ("phossy jaw"), though with scrupulous attention to ventilation and cleanliness much of the risk of the disease may be avoided. The most serious objections to the use of phosphorus, however, were overcome by the discovery of the modified form of that body known as red or amorphous phosphorus. That substance was utilized for the manufacture of the well-known "safety matches" by J. E. Lundström, of Jönköping, Sweden, in 1832; its employment for this purpose had been patented eight years previously by Haukwitz and by Congreve in Great Britain, who, however, regarded it as an oxide of phosphorus. Red phosphorus is a perfectly innocuous substance, and no evil effects arise from freely working the compositions of which it forms an ingredient. The fact again that safety matches ignite only in exceptional circumstances on any other than the prepared surfaces which accompany the box—which surfaces and not the matches themselves contain the phosphorus required for ignition—makes them much less liable to cause accidental fires than other kinds.

The processes carried out in a match factory include preparing the splints, dipping them first in molten paraffin wax and then in the igniting composition, and filling the matches into boxes. All these operations are performed by complicated automatic machinery, in the development of which the Diamond Match Company of America has taken a leading part, with the minimum of manual intervention.

The chief element in the igniting mixture of ordinary or "strike anywhere" matches used to be common yellow phosphorus, combined with one or more other bodies which readily part with oxygen under the influence of heat. Chief among these latter substances is chlorate of potash, others being red lead, nitrate of lead, bichromate of potash and peroxide of manganese. But at the beginning of the 20th century the use of yellow phosphorus owing to the danger to health attending its manipulation. In Sweden matches made with it have been prohibited for home consumption, but not for export, since 1901. In 1906 two conferences, attended by representatives of most of the government of England, were held to consider the question of prohibiting yellow phosphorus, but no general agreement was reached owing to the objections entertained by Sweden, Norway, Spain and Portugal, and also Japan. Germany, France, Italy, Denmark, Holland, Switzerland and Luxembourg, however, agreed to a convention whereby yellow phosphorus was prohibited as from 1912, and to this Great Britain expressed her adherence
MATE—MATÉ

after the passing of the White Matches Prohibition Act 1908, which forbade the manufacture and importation of such matches from the 1st of January 1910; though to avoid hardship to retailers and others holding large stocks it permitted their sale for a year longer. Phosphorus sulphide (asphaltsulphide of phosphorus) is one of the sub-
stance which is employed as a substitute for yellow phosphorus in matches which will strike anywhere without the need of a specially prepared surface.

Safety matches contain no phosphorus in the heads; according to one patent, a that composed of the mixture with a thin metal outer casing which are tipped consists of chloride of potash, 32 parts; bichromate of potash, 12; red lead, 32; sulphide of antimony, 24; while the ingredients of a suitable rubbing surface are eight parts of antimony phosphorus to nine of sulphide of antimony. There is no doubt, however, that the great diversity in the mixture is actually applied.

"Vestas" are matches in which short pieces of thin "wax taper" are used in place of wooden splints. Fusces or vasulians consist of large pieces of wood fixed on a round splint. These heads consist of a porous mixture of charcoal, salt petre, carascilla or other scented bark, glass and gum, tipped with common igniting composition. When lighted they form a glowing mass, without flame.

It is calculated that in the principal European countries from six to ten matches are used for each inhabitant daily, and the world's annual output must reach a total which requires twelve or thirteen figures for its expression. In the United States the manufacture is under control of the Diamond Match Company, formed in 1881; which company also has an important share in the industry in Great Britain, where it has established large works. Similarly the manufacture of safety matches in Sweden is largely controlled by a single company. In France matches are a government monopoly, and are both dear in price and inferior in quality, as compared with other countries where the industry is left to private enterprise. The French government formerly leased the manufacture and commerce (Société générale des allumettes chimiques), but since 1890 it has been undertaken directly by the state.

MATE (a corruption of make, from O. Eng. gemaca, a "com-
rade "), a companion. In the language of the sea, the mate is the companion or assistant of the master, or of any officer at the head of a division of the crew. In the merchant service the mates are the officers who serve under the master, commonly called the captain, navigate the vessel under his direction, and replace him if he dies, or is disabled. In a war-ship mates serve under the gunner, boatswain, carpenter, &c. They are officers told off to attend to a particular part of the ship, as for example mate of the upper deck, whose duty is to see that it is kept clean, or mate of the hold, who is employed to serve out the water and other stores, and to keep the weights adjusted so as to preserve the trim—or balance—of the ship. (For "mate" in chess, see CHESS.)

MATÉ, or Paraguay Tea, the dried leaves of Ilex paraguay-
ensis, an evergreen shrub or small tree belonging to the same genus as the common holly, a plant to which it bears some resemblance in size and habit. The leaves are from 6 to 8 in. long, shortly stalked, with a somewhat acute tip and finely toothed at the margin. The small white flowers grow in forked clusters in the axils of the leaves; the sepals, petals and stamens are four in number, or occasionally five; and the berry is 4-seeded. The plant grows abundantly in Paraguay, and the south of Brazil, forming woods called yerbas. One of the principal centres of the maté industry is the Villa Real, a small town above Asuncion on the Paraguay river; another is the Villa de San Xavier, in the district between the rivers Uruguay and Parana.

Although maté appears to have been used from time immemorial by the Indians of Paraguay, there were doubts as to the time of its introduction. This was begun at their branch missions in Paraguay and the province of Rio Grande de San Pedro, where some plantations still exist, and yield the best tea that is made. From this circumstance the names Jesuits' tea, tea of the Missions, St. Bartholomew's tea, &c., are sometimes applied to maté. Under cultivation the quality of the tea improves, but the plant remains a small shrub with numerous stems, instead of forming, as in the wild state, a tree with a rounded head. The leaves are used fresh, and the plant is cultivated for two or three years, that interval being necessary for restoration to vigorous growth. The collection of maté is, however, chiefly effected by Indians employed for that purpose by merchants, who pay considerable prices for the supply of the beverage.

When a yerba or maté wood is found, the Indians, who usually travel in companies of about twenty-five in number, build wigwams

and settle down to work for about six months. Their first operation is to prepare an open space, called a tatacu, about 6 ft. square, in which the surface of the soil is beaten hard and smooth with mallets. The leafy branches of the maté are then cut down and placed on the tatacu, where they undergo a preliminary roasting from a fire kindled around it. An arapu of poles, or of hurdles, is then erected above it, on which the maté is placed, a fire being lighted underneath. This part of the process demands some care, since by it the leaves have to be rendered brittle enough to be easily pulverized and the aroma has to be developed, the necessary amount of heat being only learned by experience. After drying, the leaves are reduced to coarse powder in mortars formed of pits in the earth well rammed. Maté so prepared is called caa gasu or yerra de polos, and is chiefly used in Brazil. In Paraguay the vicinity of Parana in the Argentine Republic, the leaves are deprived of the midrib before roasting; this is called caa-miri. A very superior quality, or caa-cuyes, is also prepared in Paraguay from the scarcely expanded buds. Another method of drying maté has been adopted, the leaves being heated in large cast-iron pans set in brick work, in the same way that tea is dried in China; it is afterwards powdered by machinery.

Portion of plant. Flower, drupe and nuts. Part of under-side of leaf showing minute glands, natural size.

The different methods of preparation influence to a certain extent the value of the product, the maté prepared in Paraguay being considered the best, that of Gran and Parana quite inferior. The leaves when dried are packed tightly in serons or oblong packages made of raw hides, which are then carefully sewed up. These shrink by exposure to the sun, and in a couple of days form compact parcels each containing about 200 lb. of tea; in this form it keeps well.

The tea is generally perfectly dry for use in a small silver-mounted calabash, made of the fruit of Crescentia cujete (Cuca) or of Lagen-
aria (Cabaqo), usually about the size of a large orange, the tapering end of the latter serving for a handle. In the top of the calabash, or maté, a circular hole about the size of a florin is made, and through this opening the tea is sucked by means of a bombilla. This instru-
ment consists of a small tube 6 or 7 in. long, formed either of metal or a reed, which has at one end a bulb made either of extremely fine basket-work or of metal perforated with minute holes, so as to prevent the particles of the tea-leaves from being drawn up into the mouth. Some sugar and a little hot water are first placed in the gourd, the yerba is then added, and finally the vessel is filled to the brim with boiling water, or milk previously heated by a spirit lamp.

1 I. gigantea, I. ovalifolia, I. Humildissima, and I. nigropunctata, besides several varieties of these species, are also used for preparing maté.

2 The word caa signified the plant in the native Indian language. The Spaniards gave it a similar name, yerba. Maté comes from the language of the Incas, and originally means a calabash. The Paraguay tea was called at first yerba do maté, and then, the yerba being dropped, the name maté came to signify the same thing.

http://www젠고.넷
A little burnt sugar or lemon juice is sometimes added instead of milk. The beverage is then handed round to the company, each person being furnished with a bombilla. The leaves will bear steeping about three times. The infusion, if not drunk soon after it is made, grows bitter. People are often fond of mixing it before every meal, and consume about 1 oz. of the leaves per day. In the neighbourhood of Paraguay it is prepared and drunk like Chinese tea. Maté is generally considered disagreeable by those unaccustomed to it, having a somewhat bitter taste; moreover, it is the custom to drink it so hot as to be unpleasant. But in the south-eastern republics it is a much-prized article of luxury, and is the first thing offered to visitors. The gaucho of the plains will travel weeks asking no better fare than dried draughts of maté, washed down with copious draughts of maté, and for it he will forego any other luxury, such as sugar, rice or biscuit. Maté acts as a restorative after great fatigue in the same manner as tea. Since it does not lose its flavour so quickly as tea by exposure to the air and moisture as more is able to travel. Since the beginning of the 17th century maté has been drunk by all classes in Paraguay, and it is now used throughout Brazil and the neighbouring countries.

The virtues of this substance are due to the occurrence in it of caffeine, of which a given quantity of maté, as prepared for drinking, contains definitely less than a similar quantity of tea or coffee. It is less astringent than either of these, and thus is, on all scores, less objectionable.

See Scully, Brazil (London, 1866); Mansfield, Brazil (London, 1856); Christy, New Commercial Plants, No. 3 (London, 1880); Kew Bulletin (1892), p. 132.

MATERA, a city of Basilicata, Italy, in the province of Potenza, from which it is 68 m. E. by road (13 m. S. of the station of Altamura), 1312 ft. above sea-level. Pop. (1901), 17,807. Part of it is built on a level plain, and part in deep ravines. The two groups of the campaniles of the lower portions being on a level with the streets of the upper. The principal building is the cathedral of the archbishop of Accenata and Matera, formed in 1203 by the union of the two bishoprics, dating respectively from 300 and 398. The western façade of the cathedral is plain, while the utmost richness of decoration is lavished on the front south front which faces the piazza. Almost in the centre of this south façade is an exquisitely sculptured window, from which letters are seen from the Greek patriarch at Constantinople used to be read. The campanile is 175 ft. high. In the vicinity are the troglodyte caverns of Monte Scagliao, still inhabited by some of the lower classes, and other caves with 13th-century frescoes.

Neolithic pottery has been found here, but the origin of the town is conjectural. Nothing is known of the town except that it was a small town in the time of William, Bras de Fer and his successors. It was the chief town of the Basilicata from 1664 till 1811, when the French transferred the administration to Potenza.

MATERIALISM (from Lat. materia, matter), in philosophy, the theory which regards all the facts of the universe as explainable in terms of matter and motion, and in particular explains all psychical processes by physical and chemical changes in the nervous system. It is thus opposed both to natural realism and to idealism. For the natural realist stands upon the common-sense position that minds and material objects have equally effective existence; while the idealist explains matter by mind and denies that mind can be explained by matter. The various forms into which materialism may be classified correspond to the various causes which induce men to take up materialistic views. Naive materialism is due to a cause which still, perhaps, has no small power, the natural difficulty which persons who have had no philosophic training experience in observing and appreciating the importance of the immaterial facts of consciousness. The pre-Socratics may be classed as naïve materialists in this sense; though, as at that early period the contrast between matter and spirit had not been fully realized and matter was credited with properties that belong to life, it is usual to apply the term hylozoism (q.v.) to the earliest stage of Greek metaphysical theory. It is not difficult to discern the influence of naïve materialism in contemporary thinking. We see it in Huxley, and still more in Haeckel, whose materialism (which he chooses to term "monism") is evidently conditioned by ignorance of the history and present position of speculation. Cosmological materialism is that form of the doctrine in which the dominant motive is the formation of a comprehensive world-scheme; the Stoics and Epicureans were cosmological materialists. In anti-religious materialism the motive is hostility to established dogmas which are connected, in the Christian system especially, with certain forms of spiritual doctrine. Such a motive weighed much with Hobbes and with the French materialists of the 18th century, such as La Mettrie and d'Holbach. The cause of medical materialism is the natural bias of physicians towards explaining the health and disease of mind by the health and disease of body. It has received its greatest support from the study of insanity, which is now fully recognized as conditioned by disease of the brain. To this school belong Mrs Maudsley and Mercier. The highest form of the doctrine is scientific materialism, by which term is meant the doctrine so commonly adopted by the physicist, zoologist and biologist.

It may perhaps be fairly said that materialism is at present a necessary methodological postulate of natural-scientific inquiry. The business of the scientist is to explain everything by the physical causes which are comparatively well understood and to exclude the interference of spiritual causes. It was the great work of Descartes to exclude rigorously from science all explanations which were not scientifically verifiable; and the prevalence of materialism at certain epochs, as in the enlightenment of the 18th century and in the German philosophy of the middle 19th, were occasioned by special need to vindicate the scientific position, in the former case against the Church, in the latter case against the pseudo-science of the Hegelian dialectic. The chief definite periods of materialism are the pre-Socratic and the post-Aristotelian in Greece, the 18th century in France, and in Germany the 19th century from about 1850 to 1880. In England materialism has been endemic, so to speak, from Hobbes to the present time, and English materialism is more important perhaps than that of any other country. But, from the national distrust of system, it has not been elaborated into a consistent metaphysic, but is rather traceable as a tendency harmonizing with the spirit of natural science. Hobbes, Locke, Hume, Mill and Herbert Spencer are not systematic materialists, but show tendencies towards materialism.

See Metaphysics; and Lange's History of Materialism.

MATERA MATUTA (connected with Lat. macea, matutinus, "morning"), an old Italian goddess of dawn. The idea of light being closely connected with childbirth, whereby the infant is brought into the light of the world, she came to be regarded as a double of Juno, and was identified by the Greeks with Eileithyia. Matuta had a temple in Rome in the Forum Boarium, where the festival of Matralia was celebrated on the 11th of June. Only married women were admitted, and none who had been married more than once were allowed to crown her image with garlands. Under hellenizing influences, she became a goddess of sea and harbours, the Ino-Leucothea of the Greeks. In this connexion it is noticeable that, as Ino tended her nephew Dionysus, so at the Matralia the participants prayed for the welfare of their nephews and nieces before that of their own children. The transformation was complete in 174 B.C., when Tiberius Sempronius Gracchus, after the conquest of Sardina, placed in the temple of Matuta a map commemorative of the campaign, containing a plan of the island and the various engagements. The progress of navigation and the association of divinities of the sky with maritime affairs probably also assisted to bring about the change, although the memory of her earlier function as a goddess of childbirth survived till imperial times.

Ovid, Fasti, vi. 475; Livy xii. 28; Plutarch, Quaestiones romanae, 16, 17.

MATHEMATICS (Gr. μαθηματική, sc. τέχνη οί επιστήμη; from μάθημα, "learning" or "science"), the general term for the various applications of mathematical thought, the traditional field of which is number and quantity. It has been usual to define mathematics as "the science of discrete and continuous magnitude." Even Leibnitz, who initiated a more modern point of view, followed the tradition in thus confining the scope of mathematics properly so called, while apparently conceiving it, as a department of a yet wider science of reasoning. A short

Mathematics

Consideration of some leading topics of the science will exemplify both the plausibility and inadequacy of the above definition. Arithmetic, algebra, and the infinitesimal calculus, are sciences directly concerned with integral numbers, rational (or fractional) numbers, and real numbers generally, which include incommensurable numbers. It would seem that "the general theory of discrete and continuous quantity" is the exact description of the topics of these sciences. Furthermore, can we not complete the circle of the mathematical sciences by adding geometry? Now geometry deals with points, lines, planes and cubic contents. Of these all except points are quantities: lines involve lengths, planes involve areas, and cubic contents involve volumes. Also, as the Cartesian geometry shows, all the relations between points are expressible in terms of geometric quantities. Accordingly, at first sight it seems reasonable to define geometry in some such way as "the science of dimensional quantity." Thus every subdivision of mathematical science would appear to deal with quantity, and the definition of mathematics as "the science of quantity" would appear to be justified. We have now to consider the reasons for rejecting this definition as inadequate.

Table of Critical Questions.—What are numbers? We can talk of five apples and ten pears. But what are "five" and "ten" apart from the apples and pears? Also in addition to the cardinal numbers there are the ordinal numbers: the fifth apple and the tenth pear claim thought. What is the relation of "the fifth" and "the tenth" to "five" and "ten"? The first rose of summer and the last rose of summer are parallel phrases, yet one explicitly introduces an ordinal number and the other does not. Again, "half a foot" and "half a pound" are easily defined. But in what sense is there a "half," which is the same for "half a foot" as "half a pound"? Furthermore, incommensurable numbers are defined as the limits arrived at as the result of certain procedures with rational numbers. But how do we know that there is anything to reach? We must know that $\sqrt{2}$ exists before we can prove that any procedure will reach it. An expedition to the North Pole has nothing to reach except the earth rotates. Also in geometry, what is a point? The straightness of a line and the planeness of a plane require consideration. Furthermore, "congruence" is a difficulty. For when a triangle "matches" another triangle it is not necessary that they keep unaltered in the moving triangle? Thus the whole method of measurement in geometry as described in the elementary textbooks and the older treatises is obscure to the last degree. Lastly, what are "dimensions"? All these topics require thorough discussion before we can rest content with the definition of mathematics as the general science of magnitude; and by the time they are discussed the definition has evaporated. An outline of the modern answers to questions such as the above will now be given. A critical defence of them would require a volume.

Cardinal Numbers.—A one-one relation between the members of two classes $a$ and $b$ is any method of correlating all the members of $a$ with all the members of $b$, so that $a$ and $b$ are one and one corresponding terms. A two-class between which a one-one relation exists, have the same cardinal number and are called cardinally similar; and the cardinal number of the class $a$ is a certain class whose members are themselves classes—namely, it is the class composed of all those classes for which a one-one relation with $a$ exists. Thus the cardinal number of $a$ is itself a class, and furthermore $a$ is a member of it. For a one-one relation can be established between the members of the class $a$ and the class $b$ through the simple process of correlating each member of $a$ with itself. Thus the cardinal number one is the class of unit classes, the cardinal number two is the class of doublets, and so on. Also a unit class is any class with the property that it possesses a member $x$ such that, if $y$ is any member of the class, then $x$ and $y$ are identical. A doublet is any class which possesses a member $x$ such that the modified class formed by all the other members except $x$ is a unit class. And so on for all the finite cardinal numbers which are thus defined successively. The cardinal number zero is the class of classes with no members; but there is only one such class, namely, the null class. Thus this cardinal number has only one member. The operations of addition and multiplication of two given cardinal numbers can be defined by taking two classes $a$ and $b$, satisfying the conditions (1) that their cardinal numbers are respectively the given numbers, and (2) that the class of the members of $a$ that have in common with the members of $b$ is a class of $a$ with members. Reference to $a$ and $b$ two other suitable classes whose cardinal numbers are defined to be respectively the required sum and product of the cardinal numbers in question. We need not here consider the details of this process.

With these definitions it is now possible to prove the following six premises applying to finite cardinal numbers, from which Peano has shown that all arithmetic can be deduced:

i. Cardinal numbers form a class.
ii. Zero is a cardinal number.
iii. If $a$ is a cardinal number, $a + 1$ is a cardinal number.
iv. If $s$ is any class and zero is a member of it, also if when $x$ is a cardinal number and a member of $s$, also $x + 1$ is a member of $s$ then the whole class of cardinal numbers is contained in $s$.
v. If $a$ and $b$ are cardinal numbers, and $a + 1 = b + 1$, then $a = b$.
vi. If $a$ is a cardinal number, then $a + 1 \neq 0$.

It may be noticed that (iv) is the familiar principle of mathematical induction. Peano in an historical note refers its first explicit employment, although without a general enunciation, to Boethius, a theologian of the sixth century. The subsequent development of this principle of the highest value, but which are in no sense the necessary premises which must be proved before any other propositions of cardinal numbers can be established. On the contrary, the premisses of Peano are essentially those of arithmetic. Furthermore, an indefinite number of propositions of arithmetic can be proved directly from logical principles without mentioning them. Thus, while arithmetic may be defined as that branch of deductive reasoning concerning classes and relations, which is consistent with the establishment of propositions concerning cardinal numbers, it must be added that the introduction of cardinal numbers makes no great break in this general science. It is no more than an interesting subdivision in a general theory.

Cardinal Numbers.—A one-one relation is first understood as what is meant by "order," that is, by "serial arrangement." An order of a set of things is to be sought in that relation holding between members of the set which constitutes that order. The set viewed as a class of its members is similarly ordered. This may happen that the numbers have a space-order very obvious to our senses; but they have also a time-order according to dates of erection, perhaps more important to the postal authorities who replace them after fixed intervals. The serial number of a class member, as it is called, is the order of the set because of its consistent obviousness to us; but, if they are the numbers drawn in a lottery, their time-order of occurrence in that drawing also ranges them in an order of some sort. Again, that is the case of the relation of position. A relation is serial when (1) it implies diversity, so that, if $x$ has the relation $R$ to $y$, $x$ is diverse from $y$; (2) it is transitive, so that if $x$ has the relation $R$ to $y$, and $y$ to $z$, then $x$ has the relation $R$ to $z$; (3) it has the property of connectivity, so that if $x$ and $y$ are things to which any things bear the relation $R$, or which bear the relation $R$ to any things, then either $x$ is identical with $y$, or $x$ has the relation $R$ to $y$, or $y$ has the relation $R$ to $x$. These conditions are necessary, but to be sure that our ordinary ideas of "placement," and "succession," hold in the relation $R$. The "field" of the relation is the class of things ranged in order by it. Two relations $R$ and $R'$ are said to be ordinarily similar, if a one-one relation holds between the members of the two fields of $R$ and $R'$, such that members of the field of $R$ are correlated with members of the field of $R'$, such that $x$ has the relation $R$ to $y$, and $x'$ and $y'$ are the correlates in the field of $R'$ of $x$ and $y$, then in such cases $x'$ has the relation $R'$ to $y'$, and conversely, interchanging the dashes on the subscripts. In this case either of two similar relations has the cardinal number of the other and, conversely, similarity of two relations implies the cardinal similarity of their fields, but not conversely. Also, two relations need not be serial in order to be ordinarily similar; but if one is serial, so is the other. Therefore, the number of members of $R$, which is the class whose members are all those relations which are ordinarily similar to it. This class will include the original relation itself. The relation-number of a relation should be compared with the cardinal number of a class. When a relation is serial, its ordinary similarity is a serial type. The addition and multiplication of two relation-numbers is defined by taking two relations $R$ and $S$, such that (1) their fields have no
terms in common; (2) their relation-numbers are the two relation-numbers in question, and then by defining of reference to $R$ and $S$ two other suitable relations whose relation-numbers are defined to be respectively the sum and product of the relation-numbers in $R$ and $S$. We have a field whose cardinal number is $n$, if $n$ be any finite cardinal number, it can be proved that the class of those serial relations, which have a field whose cardinal number is $n$, is a relation-number. This relation-number is the ordinal number of $n$ as a cardinal number, and the corresponding point by point. The ordinal number $\delta$ is the class whose sole member is the null relation—that is, the relation which never holds between any pair of entities. The definitions being thus established, it is possible to define corresponding ordinals, so that there is no essential priority of cardinals to ordinals. Here also it can be seen that the science of the finite ordinals is a particular subdivision of the general theory of classes and relations.

Cantor's Infinite Numbers.—Owing to the correspondence between the finite cardinals and the finite ordinals, the propositions of cardinal arithmetic correspond exactly with those of ordinal arithmetic. But the definition of the cardinal number of a class applies when the class is not finite, and it can be proved that there are different infinite cardinal numbers, and that there is a least infinite cardinal number, $\aleph_0$, or the number of the letters in the English alphabet. Similarly, a class of serial relations, called well-ordered serial relations, can be defined, such that their corresponding relation-numbers include the ordinary finite ordinals, but also have additional properties which distinguish them from the ordinals. It is possible to prove that the ordinals of the finite ordinals, though the fields of the relations belonging to them are not finite. These relation-numbers are the ordinary infinite ordinals. The arithmetic of the infinite ordinals does not correspond to that of the finite ordinals in any exact manner. The generation of the number of a class with that of the number of the members of the class is dealt with in the article NUMBER. It will suffice to mention here that Peano's fourth premise of arithmetic does not hold for infinite cardinals or for infinite ordinals. Contrasting the above definitions of number, cardinal and ordinal, the former is defined as the least transitive class of that number of entities of a given type, the latter as the least transitive class of that order of the members of the same type. In this way, we notice that our procedure exacts a greater attention, combined with a smaller credulity; for every idea, assumed as ultimate, demands a separate and independent demonstration.

The Sum of Two Rational Numbers.—Rational numbers and real numbers in general can now be defined according to the same general method. If $m$ and $n$ are finite cardinal numbers, the rational number $m/n$ is the relation which any finite cardinal number $x$ to the cardinal number $y$ which is the cardinal number $m/n$. Thus the rational number one, which we will denote by $1$, is not the cardinal number one; for $1$ is the relation $1$ as defined above, and is thus a relation holding between certain pairs of entities. Similarly, rational numbers can be distinguished from the corresponding ordinals. The arithmetic of rational numbers is now established by means of appropriate definitions, which indicate the entities to which the operations of addition and multiplication apply. But the real numbers are obtained by the concept of the real numbers. In general, the real numbers have led mathematicians to employ entities of this type in the analysis of more complex structures. Thus, the real numbers are the basis of the "axioms" of geometry, which constitute geometry in the article GEOMETRY (Axioms). It is sufficient to observe here that they are concerned with special types of classes and of classes of relations, and that the connection of geometry with number and magnitude is in no way an essential part of the foundation of the science. In fact, the whole theory of measurement in geometry arises at a comparatively late stage as the result of a variety of complicated considerations.

Classes and Relations.—The foregoing account of the nature of mathematics necessitates a strict deduction of the general properties of relations from the axioms of addition and multiplication. Except for the immediate purposes of an explanation, such as the above, it is unnecessary for mathematicians to have separate symbols, such as $2$, $2$, and $\aleph_0$ or $\aleph_1$; $\aleph_2$ and so on. Real numbers with signs $\pm$ or $\mp$ are now defined.

If a is a real number, $a$ is defined to be the relation which any real number of the form $x+a$ bears to the real number $x$, and $-a$ is the relation which any real number $x$ bears to the real number $-a$. The addition and multiplication of these "signed" real numbers is suitably defined, and it is proved that the usual arithmetic of such numbers follows. Finally, we reach a complex number of the $n$th order. Such a number is a "one-many" relation which contains $n$ sub-properties or $n$ algebraic complex numbers. Thus the principle of identity of indiscernibles is always satisfied, so that there is a unique real number $x_0$ such that the condition $x_n = n$ is satisfied. Hence the relation has been called above "one-many." The sum of two complex numbers $x_0 + y_0 + \ldots = x_n + y_n + \ldots$ is always defined to be the complex number $2n$, where $2n$ is the number of the sum of the complexes $x_0 + y_0 + \ldots + (2n-1) + x_n + y_n + \ldots$. But an infinite number of definitions of the product of two complex numbers yield interesting results. Each definition gives rise to a corresponding algebra of higher complex numbers. We will confine ourselves here to algebraic complex numbers, that is, to complex numbers of the second order taken in connection with that definition of multiplication which leads to ordinary algebra. The product of two complex numbers of the second order, namely, $x_0 + y_0 + \ldots = x_n + y_n + \ldots$ and $\ldots$, is always defined to be the complex number $z_0 + \ldots + (2n-1) + z_n + \ldots$. But an infinite number of definitions of the product of two complex numbers yield interesting results. Each definition gives rise to a corresponding algebra of higher complex numbers. The evolution of mathematical thought in the invention of the data of analysis has thus been completely traced in outline.

Definition of Mathematics.—It has now become apparent that the traditional field of mathematics in the province of discrete and continuous number can only be separated from the general abstract theory of classes and relations by a waving and indefinite division. Of course a discussion as to the mere application of a word easily degenerates into the most fruitless logomachy. It is open to anyone to use any word in any sense. But on the assumption that "mathematics" is to denote a science well marked out by its subject matter and its methods from other topics of thought, and that at least it is to include all topics habitually assigned to it, there is now no option but to employ "mathematics" in the general sense of the "science concerned with the logical deduction of consequences from the general premises of all reasoning."

Geometry.—The typical mathematical proposition is: "If $x$, $y$, $z$ . . . satisfy such and such conditions, then such and such other conditions hold with respect to them." By taking fixed conditions for the hypothesis of such a proposition a definite department of mathematics is marked out. For example, geometry is such a department. The "axioms" of geometry are the fixed conditions which are imposed in the hypothesis of the theorem to be proved. The special name of the "axioms" which constitute geometry is considered in the article GEOMETRY (Axioms).
of classes and relations from the ultimate logical premises. In the course of this process, undertaken for the first time with the rigour of mathematicians, some contradictions have become apparent. That first discovered is known as Burali-Forti’s contradiction, 1 and consists in the fact that there have been found to be no greatest ordinal number. But these contradictions do not depend upon any theory of number, for Russell’s contradiction 2 does not involve number in any form. This contradiction arises from considering the class of all classes which are not members of themselves. Call this class \( w \); then to say that \( x \) is a \( w \) is equivalent to saying that \( x \) is not an \( x \). Accordingly, to say that \( w \) is a \( w \) is equivalent to saying that \( w \) is not a \( w \). An analogous contradiction can be found for relations. It follows that a careful scrutiny of the very idea of classes and relations is required. Note that classes are here required in extension, so that the class of human beings and the class of rational featherless bipeds are identical; similarly for relations, which are to be determined by the entities in which they are predicated. Now the class in respect to its components is many. In what sense then can it be one? This problem of the one and the many 3 has been discussed continuously by the philosophers. 4 All the contradictions can be avoided, and yet the use of classes and relations can be preserved, as required by mathematics in general, by common sense, by a theory which denies to a class—a relation—existence or being in any sense in which the entities composing it—or related by it—exist. Thus, to say that a pen is an entity and the class of all pens a class, is to say that the members of the class constitute it, or that the second sense of “entity” (if any) is indeed derived from the first, but has a more complex signification. Consider an incomplete proposition, incomplete in the sense that some entity which ought to be the subject of a relation is not referred to in it. Such a proposition is capable of determination, but only in the second sense. If a relation is to be found for which it is a member, then the proposition is true; and conversely. Now consider a propositional function \( F_1 \) in which the variable entity \( x \) is itself a propositional function. If \( F_1 \) determines \( x \) by a relation, then some other propositional function extensionally equivalent to \( x \), then the proposition \( F_0 \) is of the form which is ordinarily recognized as being about the class determined by \( x \). This is called a function in which \( x \) is determined to be one of any one of its members. A similar theory holds for propositions which arise from the consideration of propositional functions with two or more variable arguments. It is then possible to define a parallel elaboration which is meant by classes of classes, classes of classes of classes, and so on. The theory is in effect a theory of the use of classes and relations, and does not decide the philosophic question as to whether or not an entity is merely a class upon the one hand and an entity upon the other. It does indeed deny that it is an entity in the sense in which one of its members is an entity. Accordingly, it is a fallacy for any determination of \( x \) to consider “\( x \) is an \( x \)” or “\( x \) is not an \( x \)” as having any meaning; and a propositional function which gives a true value for every determination of \( x \), “\( x \) is an \( x \)” and “\( x \) is not an \( x \)” are both meaningless, according to this theory. Thus Russell’s contradiction vanishes, and an examination of the other contradictions shows that they vanish also.

Applied Mathematics. — The selection of the topics of mathematical inquiry among the infinite variety open to it has been guided by the useful applications, and indeed the abstract theory has only recently been disentangled from the empirical elements connected with these applications. For example, the application of the theory of cardinal numbers to classes of physical entities involves in practice some process of counting. It is only recently that the succession of processes which is involved in any act of counting has been seen to be irrelevant to the idea of number. Indeed, it is only by experience that we can know that any definite process of counting will give the true cardinal number of some class of entities. It is perfectly possible to imagine a universe in which any act of counting by a being in it annihilated some members of the class counted during the time and only doubled the number. The legend of the Council of Nicaea 5 illustrates this point: "When the Bishops took their places on their thrones, they were 318; when they rose up to be called over, it appeared that they were 319; so that they never could make the number come right, and whenever they approached the last of the series, he immediately turned into the likeness of his next neighbour." Whatever be the historical worth of this story, it may safely be said that it cannot be disproved by deductive reasoning from the premises of abstract logic. The most we can do is to assert that a universe in which such things are liable to happen on a large scale is unfitted for the practical application of the theory of cardinal numbers. The application of the theory of real numbers to physical quantities involves analogous considerations. In the first place, some physical process of addition is presupposed, involving some inductively inferred law of permanence during that process. Thus in the theory of masses we must know that two pounds of lead when put together will will counterbalance in the scales two pounds of sugar, or a pound of lead and a pound of sugar. Furthermore, the sort of continuity of the series (in order of magnitude) of rational numbers is known to be different from that of the series of real numbers. Indeed, mathematicians now reserve "continuity" as the term for the latter kind of continuity; the mere property of having an infinite number of terms between any two terms is called "compactness." The compactness of the series of rational numbers is consistent with quasi-gaps in it—that is, with the possible absence of limits to classes in it. Thus the class of rational numbers whose squares are less than 2 has no upper limit among the rational numbers. But among the real numbers all classes have limits. Now, owing to the necessary inexactness of measurement, it is impossible to discriminate directly whether any kind of continuous physical quantity possesses the compactness of the series of rationals or the continuity of the series of real numbers. In calculations the latter hypothesis is made because of its mathematical simplicity. But, the assumption has certainly no a priori grounds in its favour, and it is not very easy to disprove it upon experience. But, if it should turn out that the hypothesis is to be estimated by counting the number of corpuscles (whatever they may be) which go to form it, then a body with an irrational measure of mass is intrinsically impossible. Similarly, the continuity of space apparently rests upon the assumption unsupported by any a priori or experimental grounds. Thus the current applications of mathematics to the analysis of phenomena can be justified by no a priori necessity. In one sense there is no science of applied mathematics. When once the fixed conditions which any hypothetical group of entities are to satisfy have been precisely formulated, the deduction of the further propositions, which also will hold respecting them, can proceed in complete independence of the question as to whether or no any such group of entities can be found in the world of phenomena. Thus rational mechanics, based on the Newtonian Laws, viewed as mathematics is independent of supposed application, and hydrodynamics remains a coherent and respected science though it is extremely improbable that any perfect fluid exists in the physical world. But this un challengingly logical point of view cannot be the last word upon the matter. For no one can doubt the essential difference between characteristic treatises upon “pure” and “applied” mathematics. The difference is a difference in method. In pure mathematics the hypotheses which a set of entities are to satisfy are given, and a group of interesting deductions are sought. In “applied mathematics" the “deductions” are given in the shape of the experimental evidence of natural science, and the hypotheses from which the “deductions” can be deduced are sought. Accordingly, every treatise on applied mathematics, properly so-called, is directed to the criticism of the “laws” from which the reasoning starts, or to a suggestion of results which experiment may hope to find. Thus if it calculates the result of some experiment, it is not the experimentalist’s well-attested results which are on their trial, but the basis of the calculation. Newton’s Hypotheses non fingo was a proud boast, but it rests upon an entire misconception of the capacities of the mind of man in dealing with external nature.
Synopsis of Existing Developments of Pure Mathematics.—A complete classification of mathematical sciences, as they at present exist, is to be found in the International Catalogue of Scientific Literature promoted by the Royal Society. The classification in question was a catalogue based on the subject division of the various branches of mathematics, and thus has the highest authority. It would be unfair to criticize it from an exacting philosophical point of view. The practical object of the enterprise required that the proportionate quantity of the contents of each branch, inclusive of its subdivisions, should be sufficient to avoid obscuring the individuality of each branch in the liability of various topics as a matter of fact to occur in conjunction with each other, should modify the classification.

Section B deals with the applied sciences. Under the general heading “Measurement of Mathematical Quantities” includes the topics units, measurements, and the constant of gravitation. The topics of the other headings do not require expression. These headings are: “Geometry and Kinematics of Particles and Solid Bodies,” “ dbo; “Rigid Bodies,” “Kinetics of Particles, Rigid Bodies,” “General Analytical Mechanics,” “Statics and Dynamics of Fluids,” “Hydraulics and Fluid Resistances.”

For the subject of this general heading see the articles: Analytical Dynamics, Analytical Geometry, Gyroscope, Harmonic Analysis, Wave Mechanics, Elasticity, Motion, Laws of Energy, Energetics, Astronomy (Celestial Mechanics), Tide Mechanics, including Dynamical Astronomy, that subject among those traditionally classed as “applied” which has been most completely transmuted by mathematics—that is to say, which is studied with the deductive spirit of the pure mathematician, and not with the eminently practical spirit of the applied mathematician.

Every branch of physics gives rise to an application of mathematics. A property may be hazarded that in the future these applications of mathematics will become the most important. A theory of the universe, which is a hypothetical substructure of the universe, uniform under all the diverse phenomena. This reflection is suggested by the following articles: Aether, Molecule, Capillary Action, Diffusion, Energetics, Heat, Sound, Light.

The applications of mathematics to statistics (see Statistics and Probability) should not be lost sight of; the leading fields for these applications are insurance, sociology, variation in zoology and botany.

The History of Mathematics.—The history of mathematics is in the main the history of its various branches. A short account of the history of each branch will be found in connection with the article which deals with it. Viewing the subject as a whole, and apart from remote developments which have not in fact seriously influenced the great structure of the mathematics of the European races, it may be said to have had its origin with the Greeks, working on pre-existing fragmentary lines of thought derived from the Egyptians and Phoenicians. The Greeks created the sciences of geometry and of number as applied to the measurement of continuous quantities. The great abstract ideas (considered directly and not merely in tactual use) which have formed the subject of science were due to them, namely, ratio, irrationality, continuity, the point, the straight line, the plane. This period lasted from the time of Thales, 600 B.C., to the capture of Alexandria by the Mahomedans, A.D. 641. The medieval Arabsians invented our system of numeration and developed algebra. The next period of advance stretches from the Renaissance to Newton and Leibnitz at the end of the 17th century. During this period logarithms were invented, trigonometry and algebra developed, analytical geometry invented, dynamics put upon a sound basis, and the period closed with the magnificently invented (or at least the perfecting of) the differential calculus by Newton and Leibnitz and the discovery of gravitation. The 18th century witnessed a rapid development of analysis and the period culminated with the genius of Lagrange and Laplace. This period may be conceived as continuing throughout the first quarter of the 19th century, in which the mathematical theory both for the brilliance of its achievements and for the large number of French mathematicians of the first rank who flourished during it. The next period was inaugurated in analysis by K. F. Gauss, N. H. Abel and A. L. Cauchy. Between them the general theory of the complex variable, and of the various "infinite" processes of mathematical analysis, was established, while other mathematicians, such as Poncelet, Steiner, Lobatschewsky and von Staudt, were founding modern geometry, and Gauss inaugurated the differential geometry of surfaces. The applied mathematical sciences of light, electricity and electromagnetism, and

1 Cf. A Short History of Mathematics, by W. R. Ball.
and of heat, were now largely developed. This school of mathe-
matical thought lasted beyond the middle of the century, after
which a change and further development can be traced. In
the next and last period the progress of pure mathematics has
been dominated by the critical spirit introduced by the German
mathematicians under the guidance of Weierstrass, though fore-
shadowed by earlier analysts, such as Abel. Such also ideas as
those of invariant, groups and of form, have modified the
entire science. But the progress in all directions has been too
rapid to admit of any one adequate characterization. During
the same period a brilliant group of mathematical physicists,
notably Lord Kelvin (W. Thomson), H. V. Helmholtz, J. C.
Maxwell, H. Hertz, have transformed applied mathematics by
systematically basing their deductions upon the Law of the
conservation of energy, and the hypothesis of an ether pervading
space.

Bibliography.—References to the works containing expositions
of the various branches of mathematics are given in the appro-
priate articles. It must suffice here to refer to sources in which the
subject is considered as one whole. Most philosophers refer in their
works to mathematics more or less cursorily, either in the treatmen-
t of the ideas of number and magnitude, or in their consideration of the
algebraical and geometrical problems, and their solutions. Much
references would be in effect a bibliography of metaphysics, or
rather of epistemology. The founder of the modern point of view,
explained in this article, was Leibnitz, who, however, was so far in
advancing the study of his ideas that he has been neglected and undeveloped until recently; cf. Opuscules et fragments
médiocres de Leibnitz, Extrait des manuscrits de la bibliothèque
12 and 17. The general subject of Leibnitz's philosophy, with
attempts to determine the verum and the veritatum (written in 1685); also cf. La Logique de Leibnitz, already
referred to. For the modern authors who have rediscovered and
improved upon the position of Leibnitz, cf. Grundgesetze der Arith-
tik (Berlin, 1883); Dedekind, "Was sind und was sollen die
Zahlen?" (1st ed., 1888); also cf. Frege's earlier works, Begriffs-
schrift, eine der arithmetischen nachgebildete Formelsprache
des reinen Denkens (Halle, 1879), and Die Grundlagen der
Arithmetik (2nd ed., 1884); also: Bertrand Russell, Principles of
Mathematics (Cambridge, 1903), and his article on "Mathematical Logic" in Amer. Quart. Journ. of Math. (vol. xxx.,
1908). Also the following works are of importance, though not all explicitly mentioned: C. G. Herbert, "Grundlagen
einer allgemeinen Mannigfaltigkeitslehre," Math. Annal., vol. xxi. (1885) and subsequent articles in vol. xlv. and xlix.;
also R. Dedekind, Stetigkeit und irrationales Zahlen (1st ed., 1872), and Was sind und was sollen die Zahlen? (1st ed., 1888); both tracts
translated into English under the title Essays on the Theory
of Numbers (Chicago, 1901). These works of G. Cantor and Dedekind
were of the greatest importance in the progress of the subject.
Also cf. Dedekind, "Ueber die Voraussetzung der Arithmetik in
Formulaires de mathématiques" (Turin, various editions, 1894–1908;
the earlier editions are the most interesting philosophically); Felix Klein, Lectures on Mathematics (New York, 1894); W. K.
Kleinschmidt, Grundlagen der Mathematik (Leipzig, 1908); H.
Poincaré, La Science et l'Hypothèse (Paris, 1st ed., 1902), English
translation under the title, Science and Hypothesis (London, 1905);
L. Couturat, Les Principes des mathématiques (Paris, 1905); E. Mach,
Die Mechanik in ihrer Entwicklung (Prague, 1883). English transla-
tion under the title, The Science of Mechanics (London, 1893); K.
1900, enlarged); A. Cayley, Presidential Address (Brit. Assoc.,
(1911). For the history of mathematics the one modern and complete
source of information is M. Cantor's Vorlesungen über Geschichte der
Mathematik (Leipzig, 1st Bd., 1880; 2nd Bd., 1892; 3rd Bd., 1898;
4th Bd., 1908; 1st Bd., von den ältesten Zeiten bis zum Jahre 1200
n. Chr.; 2nd Bd. von 1200–1668; 3rd Bd. von 1668–1758; 4th Bd.,
von 1758 bis 1799); W. W. R. Ball, A Short History of Mathematics
(London 1st ed., 1888; three subsequent editions, enlarged and revised; and
translations into French and Italian). (A. N. W.)

MATHER, COTTON (1663–1728). America. Congregational
clergyman, was born in Boston, Massachusetts on the 12th of February 1663. He was the grandson of Richard
Mather, and the eldest child of Increase Mather (q.e.), and Maria,
doughter of John Cotton. After studying under the famous
famous Ezekiel Cheever (1614–1708), he entered Harvard
College at twelve, and graduated in 1678. While teaching
(1678–1685), he began the study of theology, but soon, on account
of an impediment in his speech, discontinued it and took up medici-
ne. Later, however, he conquered the difficulty and finished his
preparation for the ministry. He was elected assistant pastor
in his father's church, the North, or Second, Church of Boston,
in 1681 and was ordained as his father's colleague in 1685.
In 1688, when his father went to England as agent for the colony,
he was left at twenty-five in charge of the largest congregation
in New England, and he ministered to it for the rest of his life.
He soon became one of the most influential men in the colonies.
He had much to do with the witchcraft persecution of his day;
in 1692 when the magistrates appealed to the Boston clergy
for advice in regard to the witchcraft cases in Salem he drafted
their reply, upon which the prosecutions were based; in 1690
he had written Memorable Providences Relating to Witchcraft
and Possessions, and even his earlier diaries have many entries
showing his belief in diabolical possession and his fear and hatred
of it. Thinking as he did that the New World had been the
undisturbed realm of Satan before the settlements were made
in Massachusetts, he considered it natural that the Devil should
make a peculiar effort to bring moral destruction on these
good invasions. He used prayer and fasting to deliver himself
from evil enchantment; and when he saw ecstatic and mystical
visions promising him the Lord's help and great usefulness
in the Lord's work, he feared that these revelations might be
of diabolic origin. He used his great influence to bring the suspected
persons to trial and punishment. He attended the trials,
investigated many of the cases himself, and wrote sermons on
witchcraft, the Memorable Providences and The Wonders of
the Invisible World (1693), which increased the excitement
of the people. Accordingly, when the persecutions ceased and the
reaction set in, much of the blame was laid upon him; the
influence of Judge Samuel Sewall, after he had come to think
his part in the Salem delusion a great mistake, was turned
against the Mathers; and the liberal leaders of Congregationism
in Boston, notably the Brattle, found this a vulnerable point
in Cotton Mather's armour and used their knowledge to much
effect, notably by assisting Robert Calef (d. c. 1723) in the
preparation of More Wonders of the Invisible World (1700) a
powerful criticism of Cotton Mather's part in the delusion at
Salem.

Mather took some part as adviser in the Revolution of 1689
in Massachusetts. In 1690 he became a member of the Corpora-
tion (probably the youngest ever chosen as Fellow) of Harvard
College, and in 1707 he was greatly disappointed at his failure
to be chosen president of that institution. He received the
degree of D.D. from the University of Glasgow in 1710, and
in 1713 was made a Fellow of the Royal Society. Like his
father he was deeply grieved by the liberal theology and Church
polity of the new Brattle Street Congregation, and conscientiously
opposed its pastor Benjamin Colman, who had been irregularly
ordained in England and by a Presbyterian body; but when
his father took part in 1700 in services in Colman's church,
Harvard College was now controlled by the Liberals of the Brattle
Street Church, and as it grew farther and farther away from Cal-
vinism, Mather looked with increasing favour upon the college
in Connecticut; before September 1701 he had drawn up a "scheme
for a college," the oldest document now in the Yale archives;
and finally (Jan. 1718) he wrote to a London merchant, Eliliu
Yale, and persuaded him to make a liberal gift to the college,
which was named in his honour. During the smallpox epidemic
of 1721 he attempted in vain to have treatment by inoculation
employed, for the first time in America; and for this he was
bitterly attacked on all sides, and his life was at one time in
danger; but, nevertheless, he used the treatment on his son, who
recovered, and he wrote An Account of the Method and
Success of Dr. F Perez in the Smallpox (1721).
In addition he advocated temperance, missions, Bible societies,
and the education of the negro; favoured the establishing of
libraries for working men and of religious organizations for
young people, and organized societies for other branches of
philanthropic work. His later years were clouded with many
sorrows and disappointments; his relations with Governor
Joseph Dudley were unfriendly; he lost much of his former
prestige in the Church—his own congregation dwindled—and
in the college; his uncle John Cotton was expelled from his
MATHER, INCREASE (1639–1723), American Congregational minister, was born in Dorchester, Massachusetts, on the 21st of June 1639, the youngest son of Richard Mather. 1 He entered Harvard in 1651, and graduated in 1656. In 1657, on his eighteenth birthday, he preached his first sermon; in the same year he went to visit his eldest brother in Dublin, and studied there at Trinity College, where he graduated M.A. in 1658. He was chaplain to the English garrison at Guernsey in April–December 1659 and again in 1661; and in the latter year, refusing valuable livings in England offered on condition of conformity, he returned to America. In the winter of 1661–62 he began to preach to the Second (or North) Church of Boston, and was ordained there on the 27th of May 1664. As a delegate from Dorchester, his father’s church, the Synod of 1662, he opposed the Half-Way Covenant adopted by the Synod and defended by Richard Mather and by Jonathan Mitchell (1624–1668) of Cambridge; but soon afterwards he “surrendered a glad captive” to “the truth so victoriously cleared by Mr. Mitchell,” and like his father and his son became one of the chief exponents of the Half-Way Covenant. He was bitterly opposed, however, to the liberal practices that followed the Half-Way Covenant and (after 1677) in particular to “Stoddardianism,” the doctrine of Solomon Stoddard (1643–1739) that all “such Persons as have a good Conversation and a Competent Knowledge may come to the Lord’s Supper,” only those of openly immoral life being excluded. In May 1679 Mather was a petitioner to the General Court for the call of a Select Pool to consider the reformation in New England of the Evils that have Provoked the Lord to bring his Judgments, 2 and when the “Reforming Synod” met in September it appointed him one of a committee to draft a creed; this committee reported in May 1680, at the Synod’s second session, of which Mather was moderator, the Savoy Declaration (slightly modified, notably in ch. xxiv., “Of the Civil Magistrate”), which was approved but was not made mandatory on the churches by the General Court, and in 1708 was reaffirmed at Saybrook, Connecticut. With the Cambridge Platform of 1646, drafted by his father, the Confession of 1680, for which Increase Mather was largely responsible, was printed as a book of doctrine and government for the churches of Massachusetts.

After the threat of a Quo Warranto writ in 1683 for the surrender of the Massachusetts charter, Mather used all his tremendous influence to persuade the colonists not to give up the charter; and the Boston freemen unanimously voted public submission. The royal agents immediately afterwards sent to London a treasonable letter, falsely attributed to Mather; but its spuriousness seems to have been suspected in England and Mather was not “fetch’d over and made a Sacrifice.” He became a leader in the opposition to Sir Edmund Andros, to his secretary Edward Randolph, and to Governor Joseph Dudley. He was chosen by the General Court to represent the colony’s interests in England, eluded officers sent to arrest him, 3 and in disguise boarded a ship on which he reached Weymouth on the 6th of May 1688. In London he acted with Sir Henry Ashurst, the resident agent, and had two or

1 He was so christened “because of the never-to-be-forgotten increase, of every sort, wherewith God favoured the country about the time of his nativity.” He often latinized his name, spelling it Crescentius Matherus.

2 That is, King Philip’s War, the Boston fires of 1676, when Mather’s church and home were burned, and 1679, the threatened introduction of Epicopacy, and the general spiritual decay of the country.

3 He had previously been arrested and acquitted on a charge of having attributed the forged letter to Randolph.
three fruitless audiences with James II. His first audience with William III. was on the 9th of January 1689; he was active in influencing the Commons to vote (1689) that the New England charters should be restored; and he published A Narrative of the Miseries of New-England, By Reason of an Arbitrary Government Erected there Under Sir Edmund Andros (1688), A Brief Relation for the Confirmation of Charter Privileges (1691), and other pamphlets. In 1690 he was joined by Elisha Cooke (1638-1715) and Thomas Oakes (1644-1719), additional agents, who were uncompromisingly for the renewal of the old charter. Mather, however, was instrumental in securing a new charter (signed on Oct. 7, 1691), and prevented the annexation of the Plymouth Colony to New York. The nomination of officers left to the Crown was reserved to the agents. Mather had expressed strong dissatisfaction with the clause giving the governor the right of veto, and regretted the less theocratic nature of the charter which made all freemen (and not merely church members) electors. With Sir William Phips, the new governor, a member of Mather's church, he arrived in Boston on the 14th of May 1692. The value of his services to the colony at this time is not easily over-estimated. In England he won the friendship of divines like Baxter, Tillotson and Burnet, and effectively promoted the union in 1691 of English Presbyterians and Congregationalists. He was at heavy expense throughout his stay, and even greater than his financial loss was his loss of authority and control in the church and in Harvard College because of his absence.

Mather had been acting president of Harvard College in 1681–1682, and in June 1685 he again became acting president (or rector), but still preached every Sunday in Boston and would not comply with an order of the General Court that he should reside in Cambridge. In 1701 after a short residence there he returned to Boston and wrote to the General Court to "think of another President for the Colledge." The opposition to him had been increasing in strength, his resignation was accepted, and Samuel Willard took charge of the college as vice-president, although he also refused to reside in Cambridge. That Mather's administration of the college was excellent is admitted even by his harshest critic, Josiah Quincy, in his History of Harvard University. The Liberal party, which now came into control in the college repeatedly disappointed the hopes of Cotton Mather (q.v.) that he might be chosen president, and by its ecclesiastical laxness and its broader views of Church polity forced the Mathers to turn from Harvard to Yale as a truer school for the propagation of their principles.

The Liberal leaders, John Leverett (1662-1724), William Brattle (1662-1713)—who graduated with Leverett in 1680, and with him as tutor controlled the college during Increase Mather's absence in England—William Brattle's eldest brother, Thomas Brattle (1658-1713), and Ebenezer Pemberton (1671-1717), pastor of the Old South Church, desired an "enrichment of the service," and greater liberty in the matter of baptism. In 1697 the Second Boston Church, in which Cotton Mather had been his father's colleague since 1685, upbraided the Charlestown Church "for betraying the liberties of the churches in their late putting into the hands of the whole inhabitants the choice of a minister." In 1699 Increase Mather published The Order of the Gospel, which severely (althow indirectly, criticized the methods of the "Liberal" in establishing the Brattle Street Church and especially the ordination of their minister Benjamin Colman by a Presbyterian body in London; the Liberals replied with The Gospel Order Revived, which was printed in New York to lend colour to the (partly true) charge of its authors that the printers of Massachusetts would print nothing hostile to Increase Mather. The autocracy of the Mathers in church, college, colony and press, had slipped from them. The later years of Mather's life were spent almost entirely in the work of the ministry, now beginning to be a less varied career than when he entered on it. He died on the 23rd of August 1723. He married in 1662 Maria, daughter of Sarah and John Cotton. His first wife died in 1714; and in 1715 he married Ann Lake, widow of John Cotton, of Hampton, N.H., a grandson of John Cotton of Boston.

Increase Mather was a great preacher with a simple style and a splendid voice, which had a "Tonitrous Cogency," to quote his son's phrase. His style was much simpler and more vernacular than his son's. He was an assiduous student, commonly spending sixteen hours a day among his books; but his learning (to quote Justin Winsor's contrast between Increase and Cotton Mather) "usually left his natural and Logan's education free from entanglements." He was not so much self-seeking and personally ambitious as eager to advance the cause of the church in which he so implicitly believed. That it is a mistake to consider him a narrow churchman is shown by his assisting in 1718 at the ordination of Elisha Callender in the First Baptist Church of Boston. Like the most learned men of his time he was superstitious and a firm believer in "præsagious impressions"; his Essay for the Recording of Illustrious Providences: Wherein an Account is Given of many Remarkable and very Memorable Events which have Happened in this Last Age, Especially in New England (1684) shows that he believed only less thoroughly than his son in witchcraft, though in his Cases of Conscience Concerning Evil Spirits (1693) he has some current proofs of witchcraft inadequate. The revulsion of feeling after the witchcraft delusion undermined his authority greatly, and Robert's Calef's More Wonders of the Spiritual World (1700) was a personal blow to him as well as to his son. With Jonathan Edwards, than whom he was much more of a man of affairs, and with Benjamin Franklin, whose mission in England somewhat resembled Mather's, he may be ranked among the greatest Americans of the period before the War of Independence.

The first authority for the life of Increase Mather is the work of his son Cotton Mather, Parentator: Memoirs of Remarkables in the Life and Death of the Ever Memorable Dr. Increase Mather (Boston, 1724); there are also a memoir and correlative references in Cotton Mather's Magnalia (London, 1702) especially vol. iv.; there is an excellent sketch in the first volume of J. L. Sibley's Biographical Sketches of Graduates of Harvard University (Cambridge, 1873), with an exhaustive list of Mather's works (about 150 titles); there is much valuable matter in Williston Walker's Ten New England Leaders (New York, 1901) and in his Creeds and Platforms of Congregational Churches in New England (New York, 1893); for literary criticism of the Mathers see ch. xii. of M. C. Goggin's History of the History of Literature, 1607-1670 (New York, 1878), and Barrett Wendell's Cotton Mather (New York, 1891). Mather's worth has been under-estimated by Josiah Quincy, Justin Winsor and other historians out of sympathy with his ecclesiastical spirit, who represent him as only an ambitious narrow-minded schemer.

(R. W.)

MATHER, RICHARD (1596-1669), American Congregational clergyman, was born in Lowton, in the parish of Winwick, near Liverpool, England, of a family which was in reduced circumstances but entitled to bear a coat-of-arms. He studied at Winwick grammar school, of which he was appointed a master in his fifteenth year, and left it in 1612 to become master of a newly established school at Tosteth Park, Liverpool. After a few months at Brasenose College, Oxford, he began in November 1618 to preach at Tosteth, and was ordained there, possibly only as deacon, early in 1619. In August-November 1633 he was suspended for nonconformity in matters of ceremony; and in 1634 was again suspended by the visitors of Richard Neile, Archbishop of York, who, hearing that he had never worn a surplice during the fifteen years of his ministry, refused to reinstate him and said that "it had been better for him that he had gotten Seven Bastards." He had a great reputation as a preacher in and about Liverpool; but, advised by letters of John Cotton and Thomas Hooker, and persuaded by his

1 Mather led the resistance to the royal demand instigated by Edward Andros, for the annulment of the college charters, and after its vacation in 1684 strove for the grant of a new charter; King James promised him a confirmation of the former charter; the new provincial charter granted by William and Mary confirmed all the privileges of the new charter; the college was Parsons and was chartered to Parson's son. In 1692 Mather drafted an act incorporating the college, which was signed by Phips but was disallowed in England; and in 1696, 1697, 1699, and 1700, Mather repeated his efforts for a college charter.
own elaborate formal "Arguments tending to prove the Removing from Old-England to New ... to be not only lawful, but also necessary for them that are not otherwise tyed, but free," he left England and on the 17th of August 1635, and landed in Boston after an "extraordinary and miraculous deliverance" from a terrible storm. As a famous preacher he was desired at Plimouth, Dorchester, and Roxbury. He went to Dorchester, where the Church had been greatly depleted by migrations to Windsor, Connecticut; and where, after a delay of several months, in August 1636 there was constituted by the consent of magistrates and clergy a church of which he was "teacher" until his death in Dorchester on the 22nd of April 1669.

He was an able preacher, "aiming," said his biographer, "to shoot his arrows not over his people's heads, but into their Hearts and Conscience." He was a leader of New England Congregationalism, whose policy he defended and described in the tract Church Government and Church Covenant Discussed, in an Answer of the Elders of the Several Churches of New England to Two and Thirty Questions (written 1639; printed 1643), and in his Reply to Mr. Rutherford (1647), a polemic against the Presbyterianism to which the English Congregationalists were then tending. He drafted the Cambridge Platform, an ecclesiastical constitution in seventeen chapters, adopted (with the omission of Matthew's paragraph be- longing to the "Half-way Covenant," of which he strongly approved) by the general synod in August 1646. In 1657 he drafted the declaration of the Ministerial Convention on the meaning and force of the Halfastatement, which was used by the Assembly in his "A Disputation concerning Church Members and their Children in Answer to XXI. Questions. "With Thomas Welde and John Eliot he wrote the "Bay Psalm Book," or, more accurately, The Whole Book of Psalms Faithfully Translated into English Metre (1640), probably the first book printed in the English colonies.

He married in 1624 Katherine Hoult or Holt (d. 1655), and secondly in 1656 Sarah Hankredge (d. 1676), the widow of John Cotton. Of six sons, ailsbury, first, 54 m. from Boston: Samuel (1626-1671), the first fellow of Harvard College who was a graduate, chaplain of Magdalen College, Oxford, in 1630-1633, and pastor (1656-1671, excepting suspension in 1660-1662) of St Nicholas's in Dublin; Nathaniel (1630-1697), who graduated at Harvard in 1647, was vicar of Barnstable, Devon, in 1656-1662, pastor of the English Church in Rotterdam, his brother's successor in 1671-1688, and then until his death pastor of a church in London; Eleazar (1637-1669), who graduated at Harvard in 1656 and after preaching in Northampton, Massachusetts, for three years, became in 1661 pastor of the church there; and Increase Mather (q.v.). Horace E. Mather, in his Lineage of Richard Mather (Hartford, Connecticut, 1809), gives a list of 80 clergymen descended from Richard Mather, of whom 39 bore the name Mather and 31 other names, the more famous being Storrs and Scufliffier.

See The Life and Death of That Reverend Man of God, Mr Richard Mather (Cambridge, 1670; reprinted 1850, with his Journal for 1635, by the Dorchester Antiquarian and Historical Society), with an introduction by Increase Mather, who may have been the author; W. B. Sprague's Annals of the American Pulpit, vol. i. (New York, 1857); Cotton Mather's Magnalia (London, 1702); an essay on Richard Mather in Williston Walker's Ten New England Leaders (New York, 1901); and the works referred to in the article on Increase Mather. (R. Ws.)

MATHERAN, a hill sanatorium in India, in the Kolaba district of Bombay, 2490 ft. above the sea, and about 30 m. E. of Bombay city. Pop. (1901), 3060. It consists of several thickly wooded ridges, on a spur of the Western Ghats, with a magnificent outlook over the plain below and the distant sea. First explored in 1850, it has since become the favourite resort of the middle classes of Bombay (especially the Parsis) during the spring and autumn months. It has recently been connected by a gauge mountain line with Neral station on the Great Indian Peninsula Railway.

MATHESON, GEORGE (1842-1906), Scottish theologian and preacher, was born in Glasgow in 1842, the son of George Matheson, a merchant. He was educated at the university of Glasgow, where he graduated first in classics, logic and philosophy. In his twentieth year he became totally blind, but he held to his resolve to enter the ministry, and gave himself to theological and historical study. His first ministry began in 1868 at Inzellan, on the Arrighyll coast between Dunoon and Toward. His books on Aids to the Study of German Theology, Can the Old Faith live with the New? The Growth of the Spirit of Christianity from the First Century to the Dawn of the Lutheran Era, established his reputation as a liberal and spiritually minded theologian; and Queen Victoria invited him to preach at Balmoral. In 1886 he removed to Edinburgh, where he became minister of St Bernard's Parish Church. Here his chief work as a preacher was done. In 1879 the university of Edinburgh conferred upon him the honorary degree of D.D., and the same year he declined an invitation to the pastorate of Crown Court, London, in succession to Dr John Cumming (1807-1881). In 1881 he was chosen as Baird lecturer, and took for his subject "Natural Elements of Revealed Theology," and in 1882 he was the St Giles lecturer, his subject being Confucianism. In 1890 he was elected a fellow of the Royal Society of Edinburgh, Archibald gave him his honorary LL.D., and in 1890 he was appointed Gifford lecturer by that university, but declined on grounds of health. In the same year he severed his active connexion with St Bernard's. One of his hymns, "O love that will not let me go," has passed into the popular hymnology of the Christian Church. He died suddenly of apoplexy on the 28th of August 1906. His exegesis owes its interest to his subjective resources rather than to breadth of learning; his power lay in spiritual vision rather than balanced judgment, and in the vivid apprehension of the factors which make the Christian personality, rather than in constructive doctrinal statement.

MATHEW, THEOBALD (1790-1850), Irish temperance reformer, popularly known as Father Mathew, was descended from a branch of the Llandaff family, and was born at Thomas-town, Tipperary, on the 10th of October 1790. He received his school education at Kilkenny, whence he passed for a short time to Maynooth; from 1818 to 1824 he studied at Dublin, where in the latter year he was ordained to the priesthood. Having entered the Capuchin order, he, after a brief time of service at Kilkenny, joined the mission in Cork, which was the scene of his religious and benevolent labours for many years. The movement with which his name is most intimately associated began in 1838 with the establishment of a total abstinence association, which in less than nine months, thanks to his moral influence and eloquence, enrolled no fewer than 150,000 names. It rapidly spread to Limerick and elsewhere, and some idea of its popularity may be formed from the fact that at Nenagh 20,000 persons are said to have taken the pledge in one day, 100,000 at Galway in two days, and 70,000 in Dublin in five days. In 1844 he visited Liverpool, Manchester and London with almost equal success. Meanwhile the expenses of his enterprise had involved him in heavy liabilities, and led on one occasion to his arrest for debt. From his embarrassment he was only partially relieved by a pension of £300 granted by Queen Victoria in 1847. In 1849 he paid a visit to the United States, returning in 1851. He died at Queenstown on the 8th of December, 1856.

See Father Mathew, a Biography, by J. F. Maguire, M.P. (1863).

MATHES, CHARLES (1776-1835), English actor, was born in London on the 28th of June 1776. His father was "a serious bookseller," who also officiated as minister in one of Lady Huntingdon's chapels. Mathews was educated at Merchant Taylors' School. His love for the stage was formed in his boyhood, when he was apprentice to his father, and the latter in 1794 unwillingly permitted him to enter on a theatrical engagement in Dublin. For several years Mathews had not only to content himself with thanless parts at a low salary, but in May 1803 he made his first London appearance at the Haymarket as Jabez in Cumberland's The Jenv and as Lingo in The Agreeable Surprise. From this time his professional career was an uninterrupted triumph. He had a wonderful gift of mimicry, and could completely disguise his personality without the smallest change of dress. The versatility and originality of his powers were admirably displayed in his "At
Homes," begun in the Lyceum theatre in 1818, which, according to Leigh Hunt, "for the richness and variety of his humour, were as good as half a dozen plays distilled." Off the stage his simple and kind-hearted disposition won him affection and esteem. In 1822 Mathews visited America, his observation on his experiences there forming for the reader a most entertaining portion of his biography. From infancy his health had been uncertain, and the toils of his profession gradually undermined it. In 1834 he paid a second visit to America. His last appearance in New York was on the 11th of February 1835, when he played Samuel Cudde in Married Life and Andrew Steward in The Lone House. He died at Plymouth on the 26th of June 1835. In 1797 he had married Eliza Kirkham Strong (d. 1802), and in 1803 Anne Jackson, an actress, the author of the popular and diverting Memoirs, by Mrs Mathews (4 vols., 1839-1850).

His son CHARLES JAMES MATHEWS (1803–1878), who was born at Liverpool on the 26th of December 1803, became even better known as an actor. After attending Merchant Taylors' School he was apprenticed to a sculptor, and continued for some years nominally to follow the profession. His first public appearance on the stage was made on the 4th of December 1835, at the Olympic, London, as George Rattleton in his son's play The Humpbacked Lover, and as Tim Topple the Tiger in Leman Rode's Old and Young Stagger. In 1838 he married Madame Vestris, then lessee of the Olympic, but neither his management of this theatre, nor subsequently of Covent Garden, nor of the Lyceum, resulted in pecuniary success, although the introduction of scenery more realistic and careful in detail than had hitherto been employed was due to his enterprise. In the year of his marriage he visited America, but without receiving a very cordial welcome. As an actor he held in England an unrivalled place in his peculiar vein of light eccentric comedy. The serene grace of his manner, and the imperturbable solemnity with which he perpetrated his absurdities, never failed to charm and amuse; his humour was never broad, but always measured and restrained. It was as the leading character in such plays as the Game of Speculation, My Awful Dad, Cool as a Cucumber, Patter versus Clatter, and Little Toddlekins, that he especially excelled. In 1856 Mme Vestris died, and in the following year Mathews again visited the United States, where in 1858 he married Mrs A. H. Davenport. In 1861 they gave a series of " At Homes" at the Haymarket theatre, which were almost as popular as had been those of the elder Mathews. Charles James Mathews was one of the few English actors who played in French successfully,—his appearance in Paris in 1853 in a French version of Cool as a Cucumber, written by himself, being received with great approbation. He also played there again in 1863 as Sir Charles Coldcram in the original play L'Homme blâmé (English version by Boucicaut, Used up). After reaching his sixty-sixth year, Mathews set out on a tour round the world, in which was included a third visit to America, and on his return in 1872 he continued to act without interruption till within a few weeks of his death on the 24th of June 1878. He made his last appearance in New York at Wallack's theatre on the 7th of June 1872, in H. J. Byron's Not such a Fool as he Looks. His last appearance in London was at the Opéra Comique on the 2nd of June 1877, in The Liar and The Cozy Couple. At Stalybridge he gave his last performance on the 8th of June 1878, when he played Adonis Evergreen in his own comedy My Awful Dad.

MATTHEWS, THOMAS (1676–1751), British admiral, son of Colonel Edward Mathews (d. 1700), and grandson on his mother's side of Sir Thomas Armstrong (1624–1684), who was executed for the Rye House Plot, was born at Llandaff Court, Llandaff. He entered the navy and became lieutenant in 1699, being promoted captain in 1703. During the short war with Spain (1718–20) he commanded the "Kent" in the fleet of Sir George Byng (Lord Torrington), and from 1722 to 1724 he had the command of a small squadron sent to the East Indies to repress the pirates of the coast of Malabar. He saw no further service till March 1741, when he was appointed to the command of the Mediterranean, and pleni potentiary to the king of Sardinia and the other courts of Italy. It is impossible to understand upon what grounds he was selected. As an admiral he was not distinguished; he was quite destitute of the experience and the tact required for his diplomatic duties; and he was on the worst possible terms with his second in command, Richard Lestock (1672–1746). Yet the purpose for which he was sent out in his double capacity was not altogether ill performed. In 1742 Mathews sent a small squadron to Naples to compel King Charles III., afterwards king of Spain, to remain neutral. It was commanded by commodore, afterwards admiral, William Martin (1666–1756), who refused to enter into negotiations, and gave the king half an hour in which to return an answer. In June of the same year a squadron of Spanish galleys, which had taken refuge in the Bay of Saint Tropez, was burnt by the fireships of Mathews' fleet. In the meantime a Spanish squadron of line-of-battleships had taken refuge in Toulon, and was watched by the British fleet from its anchorage at Hyères. In February 1744 the Spaniards put to sea in company with a French force. Mathews, who had now returned to the flagship, followed, and an engagement took place on the 11th of February. The battle was highly creditable to the British fleet, and was very honourable to its opponents, but it is of the highest historical importance in the history of the navy. It marked the lowest pitch reached in discipline and fighting and efficiency by the fleet in the 18th century, and it had a very bad effect in confirming the pedantic system of tactics set up by the old Fighting Instructions. The British fleet followed the enemy in light winds on the 10th of February, and became scattered. Mathews hoisted the signal form line, and then when night fell, to lie to. At that moment Lestock, who commanded in the rear, was at a considerable distance from the body of the fleet, and he ought undoubtedly to have joined his admiral before lying to, but he obeyed the second order, with the result, which it is impossible not to feel that he foresaw and desired, that when morning came he was a long way off the flag of Mathews. The enemy were within striking distance of the van and centre of the British fleet, and Mathews attacked their rear. The battle was ill fought, had been ill prepared. Lestock never came into action at all. One Spanish line-of-battleship, the "Poder" (74), was taken, but afterwards burnt. Several of the British captains behaved very badly, and Mathews in a heat of confused anger bore down on the enemy out of his line, while the signal to keep the line was still flying at his mast head. The French and Spaniards got away, and were not pursued by Mathews, though they were of inferior strength. Deep indignation was aroused at home by this naval miscarriage, and the battle led to more than twenty courts martial and a parliamentary inquiry. The evils which had overthrown the navy were clearly displayed, and in so far some good was done. It was shown for instance that one of the captains whose ship behaved worst was a man of extreme age who was nearly blind and deaf. One of the captains was so frightened at the prospect of a trial that he deserted on his way home and disappeared into Spain. Mathews resigned and returned home after the battle. In consequence of the parliamentary motion for inquiry, Lestock was brought to trial, and acquitted on the ground that he had obeyed orders. Then Mathews was tried in 1746, and was condemned to be dismissed the service on the ground that he had not only failed to pursue the enemy but had taken his fleet into action in a confused manner. He had in fact not waited till he had his fleet in a line with the enemy before bearing down on them, and he had disordered his own line. To the country at large it appeared strange that the admiral who had actually fought should be condemned, while the admiral who had kept at a distance was acquitted. Mathews looked upon his condemnation as the result of mere party spirit. Sheer pedantry on the part of the officers forming
the court-martial affords a more satisfactory explanation. They judged that a naval officer was bound not to go beyond the Fighting Instructions as Mathews had undoubtedly done, and further that there was no serious effect in fixing the rule that all battles, at any rate against enemies of equal or nearly equal numbers, were to be fought on one pattern. Mathews died on the 2nd of October 1751 in London. There is a portrait of him in the Painted Hall at Greenwich.

In Beatson's Naval and Military Memoirs, vol. i., will be found a fair account of the battle of February 1744. It is fully dealt with by Montagu Burrows in his Life of Hawke. The French account may be found among Brownes Précis, and a French Spagnol view is in the Vida de Don Jose Navarro by Don Jose de Vargas. The battle led to a violent pamphlet controversy. The charges and findings at the courts-martial on both Lestock and Mathews were published at the time. The minor trials arising out of the action are collected in a folio under the title "Copies of all the Minutes and Proceedings taken at and upon the several Trials of Captain George Burrish" (1746). A "Narrative" was published by or, for, Lestock in 1744, and answered by, or on behalf of, Mathews under the title "Ad—M—w's Conduct in the late Engagement. Vindicated," in 1745.

MATHY, KARL (1807–1868), Badenese statesman, was born at Mannheim on the 17th of March 1807. He studied law and politics at Heidelberg, and entered the Baden government department of finance in 1829. His sympathy with the revolutionary ideas of 1830, expressed in his paper the Zeitgeist, cost him his appointment in 1834, and he made his way to Switzerland, where he contributed to the Jeune Suisse directed by Mazzini. On his return to Baden in 1840 he edited the Landtagszeitung at Carlsruhe, and in 1842 he entered the estates for the town of Constance. He became one of the opposition leaders and in 1847 helped to found the Deutsche Zeitung, a paper which eventually did much to further the cause of German unity. He took part in the preliminary parliament and in the assembly of Frankfort in 1848–1849, where he supported the policy of H. W. A. von Gagern, and after the refusal of Frederick William IV. to accept the imperial crown he still worked for the cause of unity. He was made finance minister in Baden in May 1849, but was dismissed after a few days of office. He then applied his financial knowledge to banking business in Cologne, Berlin, Gotha and Leipzig. He was recalled to Baden in 1862, and in 1864 became president of the new ministry of commerce. He sought to bring Baden institutions into line with those of northern Germany with a view to ultimate union, and when in 1866 Baden took sides with Austria against Prussia he sent in his resignation. After the war he became president of a new cabinet, but he did not live to see the realization of the policy for which he had striven. He died at Carlsruhe on the 3rd of February 1868.

His letters during the years 1846–1848 were edited by Ludwig Mathy (Leipzig, 1899), and his life was written by G. Freytag (Leipzig, 2nd ed., 1872).

MATILDA (1102–1165), queen of England and empress, daughter of Henry I. of England, by Matilda, his first wife, was born in 1102. In 1109 she was betrothed to the emperor-elect, Henry V., and was sent to Germany, but the marriage was delayed till 1114. Her husband died after eleven years of wedlock, leaving her childless; and, since both her brothers were now dead, she was recalled to her father's court in order that she might be recognized as his successor in England and Normandy. The Great Council of England did homage to her under considerable pressure. Their reluctance to acknowledge a woman as imposant in case when Henry gave her in marriage to Geoffrey Plantagenet, son of Stephen of Mortain and Boulogne. Matilda and her husband were in Anjou at the time. They wasted the next few years in the attempt to win Normandy; but, Earl Robert of Gloucester, the half-brother of the emperor, at length induced her to visit England and raise her standard in the western shires, where his influence was supreme. Though on her first landing Matilda only escaped capture through the misplaced chivalry of her opponent, she soon turned the tables upon him with the help of the Church and the barons of the west. Stephen was defeated and captured at Lincoln (1141); the empress was acclaimed lady or queen of England (she used both titles indifferently) and crowned at London. But the arrogance which she displayed in her prosperity alienated the Londoners and the papal legate, Bishop Henry of Winchester. Routcd at the siege of Winchester, she was compelled to release Stephen in exchange for Earl Robert, and thenceforward her cause steadily declined in England. In 1148, having lost by the earl's death her principal supporter, she retired to Normandy, of which her husband had in the meantime gained possession. Henceforward she remained in the background, leaving her eldest son Henry to pursue the struggle with Stephen. She outlived Henry's coronation by ten years; her husband had died in 1151. As queen-mother she played the part of a mediator between her sons and political parties. Age mellowed her temper, and she turned more and more from secular ambitions to charity and religious works. She died on the 30th of January 1164.

in the Benedictine church at Polirone, whence her remains were taken to Rome by order of Urban VIII. in 1635 and interred in St Peter's.

The contemporary record of Matilda's life in rude Latin verse, by her chaplain Domnirone (Doniz or Domenico), is preserved in the Vincenzo dei Biontoni in the Monumenta germ. hist. scriptores, xii. 348-409. The text, with an Italian translation, was published by F. Davoli under the title Vita della grande contessa Matilda di Canossa (Reggio nell'Emilia 1888).

(C. H. Ha.)

MATINS (Fr. matines; med. Lat. matutinae, so. possibly Vigiliae, morning watches; now matins, "belonging to the morning"), a word now only used in an ecclesiastical sense for one of the canonical hours in the Roman Breviary, originally intended to be said at midnight, but sometimes said at dawn, after which "lauds" were recited or sung. In the modern Roman Catholic Church, outside monastic services, the office is usually said on the preceding afternoon or evening. The word is also used in the Roman Catholic Church for the public service held on Sunday mornings before the mass (see Breviary; and Hours, Canonical). In the Church of England since the Reformation matins is used for the order of public morning prayer.

MATLOCK, a market town in the western parliamentary division of Derbyshire, England, on the river Derwent, 17 m. N. by W. of Derby on the Midland railway. Pop. (1901), of urban district of Matlock, 5979; of Matlock Bath and Scarlett's Nick, 1819. The entire township includes the old village of Matlock, the commercial and manufacturing district, Bridge End, and the fashionable health resorts of Matlock Bath and Matlock Bank. The town possesses cotton, corn and paper mills, while in the vicinity there are stone-quarries and lead mines. A peculiar local industry is the manufacture of so-called "petrified" birds' nests, plants, and other objects. These are steeped in water from the mineral springs until they become encrusted with a calcareous deposit which gives them the appearance of fossils. Ornaments fashioned out of spar and stalactites have also a considerable sale.

Matlock Bath, one and a half miles south of Matlock, having a separate railway station, overlooks the narrow and precipitous gorge of the Derwent, and stands in the midst of woods and cliffs, deriving its name from three medicinal springs, which first became celebrated towards the close of the 17th century. They were not known to the Romans, although lead-mining was carried on extensively in the district in the 1st and 2nd centuries A.D. The mean temperature of the springs is 68° F. Extensive grounds have been laid out for public use; and in the neighbourhood there are several fine stalactite caverns.

Sheltered under the high moorslands of Darley, Matlock Bath has grown up about a mile north-east of the old village, and has become celebrated for the number and excellence of its hydropathic establishments. A tramway, worked by a single cable, over a gradient said to be the steepest in the world, affords easy communication with Matlock Bridge.

MATOS FRAGOSO, JUAN DE (1614-1689), Spanish dramatist, of Portuguese descent, was born about 1614 at Alcisto (Alemtejo). After taking his degree in law at the university of Evora, he proceeded to Madrid, where he made acquaintance with Perez de Montalban, and thus obtained an introduction to the stage. He quickly displayed great cleverness in hitting the public taste, and many contemporaries of superior talent easily sought his aid as a collaborator. The earliest of his printed plays is La Defensa de la fe y principio prodigioso (1651), and twelve more pieces were published in 1658. But though his popularity continued long after his death (January 4, 1689), Matos Fragoso's dramas do not stand the test of reading. His emphatic preciseness and sophistical insistence on the "point of honour" are tedious and unconvincing; in La Venganza en el despecho, in A lo que obliga un agravio, and in other plays, he merely recasts, very adroitly, works by Lope de Vega.

MATRASS (mod. Lat. matrassum), a glass vessel with a round or oval body and a long narrow neck, used in chemistry, &c., as a digester or distiller. The Florence flask of commerce is frequently used for this purpose. The word is possibly identical with an old name "matras" (Fr. matras, matelas) for the bolt or quarrel of a cross-bow. If so, some identity of shape is the reason for the application of the word; "bolt-head" is also used as a name for the vessel. Another connexion is suggested with the Arabic mara, a leather bottle.

MATRIARCHATE ("rule of the mother"), a term used to express a supposed earliest and lowest form of family life, typical of primitive societies, in which the promiscuous relations of the sexes result in the child's father being unknown (see Family). In such communities the mother took precedence of the father in certain important respects, especially in line of descent and inheritance. Matriarchate is assumed on this theory to have been universal in prehistoric times. The prominent position thus naturally assigned women did not, however, imply any personal power, since they were in the position of mere chattels: it simply constituted them the sole relatives of their children and the only centre of any such family life as existed. The custom of tracing descent through the female is still observed among certain savage tribes. In Fiji father and son are not regarded as relatives. Among the Bechuana the chiefship passes to a brother, not to a son. In Senegal, Loango, Congo and Guinea, relationship is traced through the female. Among the Tuareg Berbers a child takes rank, freeman's or slave's, from its mother.

MATRIMONY (Lat. matrimonium, marriage, which is the ordinary English sense), a game at cards played with a full whist pack upon a table divided into three compartments labelled "Matrimony," "Intrigue" and "Confederacy," and two smaller spaces, "Fair" and "Best." These names indicate combinations of two cards, any king and queen being "Matrimony," any queen and knave "Intrigue," any king and knave "Confederacy"; while any two cards of the same denomination form a "Fair," and the diamond ace is best. The dealer distributes a number of counters, to which an agreed value has been given, upon the compartments, and the other players do likewise. The dealer then gives one card to each player, face down, and a second, face up. If any turned-up card is the diamond ace, the player holding it takes everything on the space and the deal passes. If not turned, the diamond ace has only the value of the other three aces. If it is not turned, the players, beginning with the eldest hand, expose their second cards, and the resulting combinations, if among the five successful ones, win the counters of the corresponding spaces. If the counters on a space are not won, they remain until the next deal.

MATRIX, a word of somewhat wide application, chiefly used in the sense of a bed or enclosing mass in which something is shaped or formed (Late Lat. matrix, womb; in classical Latin matrix was only applied to an animal kept for breeding). Matrix is thus used of a mould of metal or other substance in which a design or pattern is made in intaglio, and from which an impression in relief is taken. In die-sinking and coining, the matrix is the hardened steel mould from which
MATROSS—MATSYS

The die-punches are taken. The term "seal" should strictly be applied to the impression only on wax of the design of the matrix, but is often used both of the matrix and of the impression (see "Seals"). In typography, the matrix is the mass in which a crystal mineral or fossil is embedded. In mathematics, the name "matrix" is used of an arrangement of numbers or symbols in a rectangular or square figure. (See Algebraic Forms.)

In med. Latin matrix and the diminutive matricula had the meaning of a roll or register, particularly one containing the names of the members of an institution, as of the clergy belonging to a cathedral, collegiate or other church, or of the members of a university. From this use is derived "matriculation," the admission to membership of a university, also the name of the examination for such admission. Matricula was also the name of the contributions in men and money made by the various states of the Holy Roman Empire, and in the modern German Empire the contributions made by the federal states to the imperial finances are called Matrklarbeitäge, matricular contributions. (See Germany: Finance.)

MATROSS, the name (now obsolete) for a soldier of artillery, who ranked next below a gunner. The duty of a matross was to assist the gunners in loading, firing and sponging the guns. They were provided with firelocks, and marched with the store-wagons, acting as guards. In the American army a matross rank next below a private infantry. The word is probably derived from Fr. matelot, a sailor.

MATSUKATA, MARQUI (1835— ), Japanese statesman, was born at Kagoshima in 1835, being a son of a samurai of the Satsuma clan. On the completion of the feudal revolution of 1868 he was appointed governor of the province of Tosa, and having served six years in this office, was transferred to Tôkyô as assistant minister of finance. As representative of Japan at the Paris Exhibition of 1878, he took the opportunity afforded by his mission to study the financial systems of the great European powers. On his return home, he held for a short time in 1880 the portfolio of home affairs, and was in 1881 appointed minister of finance. The condition of the currency of Japan was at that time deplorable, and national bankruptcy threatened. The coinage had not only been seriously debased during the closing years of the Tokugawa régime, but large quantities of paper currency had been issued and circulated, both by many of the feudal lords, and by the central government itself, as a temporary expedient for filling an impoverished exchequer. In 1878, depreciation set in, and by 1881 the rate of the 1880 gold standard was such an extent that it was then at a discount of 80% as compared with silver. Matsukata showed the government the danger of the situation, and urged that the issue of further paper currency should be stopped at once, the expenses of administration curtailed, and the resulting surplus of revenue used in the redemption of the paper currency and in the creation of a specie reserve. These proposals were acted upon: the Bank of Japan was established, and the right of issuing convertible notes given to it; and within three years of the institution of these financial reforms, the paper currency, largely reduced in quantity, was restored to its full par value with silver, and the currency as a whole placed on a solvent basis. From this time forward Japan's commercial and military advancement continued to make uninterrupted progress.

But pari passu with the extraordinary impetus given to its trade by the successful conclusion of the war with China, the national expenditure enormously increased, rising within a few years from 80 to 250 million yen. The task of providing for this expenditure fell entirely on Matsukata, who, as the fact that taxation was an hot potato question on the part of the diet. But he distributed the increased taxation so equally, and chose its subjects so wisely, that the ordinary administrative expenditure and the interest on the national debt were fully provided for, while the extraordinary expenditure for military purposes was met from the Chinese indemnity. As far back as 1878 Matsukata perceived the advantages of a gold standard, but it was not until 1897 that his scheme could be realized. In this year the bill authorizing it was under his auspices submitted to the diet and passed; and with this financial achievement Matsukata saw the fulfilment of his ideas of financial reform, which were conceived during his first visit to Europe. Matsukata, who in 1884 was created Count, twice held the office of prime minister (1891—1892, 1896—1898), and during both his administrations he combined the portfolio of finance with the premiership; from October 1898 to October 1900 he was minister of finance only. His name in Japanese history is indissolubly connected with the financial progress of his country at the end of the 19th century. In 1902 he visited England and America, and he was created G.C.M.G., and given the Oxford degree of D.C.L. In September 1907 he was advanced to the rank of Marquis.

MATSYS (MASSYS or METZYS), QUINTIN (1466—1530), Flemish artist, was born at Louvain, where he first learned a mechanical art. During the greater part of the 15th century the centres in which the painters of the Low Countries most congregated were Bruges, Ghent and Brussels. Towards the close of the same period Louvain took a prominent part in giving employment to workmen of every craft. It was not till the opening of the 16th century that Antwerp usurped the lead which it afterwards maintained against Bruges and Ghent, Brussels, Mechlin and Louvain. Quintin Matsys was a pupil of the first Antwerp masters, gild of Antwerp. A legend relates how the smith of Louvain was induced by affection for the daughter of an artist to change his trade and acquire proficiency in painting. A less poetic but perhaps more real version of the story tells that Quintin had a brother with whom he was brought up by his father Josse Matsys, a smith, who held the lucrative offices of clockmaker and architect to the municipality of Louvain. It came to be a question which of the sons should follow the paternal business, and which carve out a new profession for himself. Josse the son elected to succeed his father, and Quintin then gave himself to the study of painting. We are not told expressly by whom Quintin was taught, but his style seems necessarily derived from the lessons of Dierick Bouts, who took to Louvain the mixed art of Memling and Van der Weyden. When he settled at Antwerp, at the age of twenty-five, he probably had a style with an impress of its own, which certainly contributed most importantly to the revival of Flemish art on the lines of Van Eyck and Van der Weyden. What particularly characterizes Quintin Matsys is the strong religious feeling which he inherited from his earlier school. But, at about the same period, his gild was perpetually degenerated into the grotesque. Nor would it be too much to say that the facial peculiarities of the boors of Van Steen or Ostade have their counterparts in the pictures of Matsys, who was not, however, trained to use them in the same homely way. From Van der Weyden's example we may trace the dryness of outline and shadeless modelling and the pitiless finish even of trivial detail, from the Van Eycks and Memling through Dierick Bouts the superior glow and richness of transparent pigments, which mark the pictures of Matsys.

The date of his retirement from Louvain is 1491, when he became a master in the gild of painters at Antwerp. His most celebrated picture is that which he executed in 1508 for the joiners' company in the cathedral of his adopted city. Next in importance to that is the Marys of Scripture round the Virgin and Child, which was ordered for a chapel in the cathedral of Louvain. Both altar-pieces are now in public museums, one at Antwerp, the other at Brussels. They display great earnestness in expression, great minuteness of finish, and a great ablation of effect of light or shade. As in early Flemish pictures so in those of Matsys, supererogatory care is lavished on jewelry, edgings and ornament. To the great defect of want of atmosphere such faults may be added as affection, the result of excessive straining after tenderness in women, or common gesture and grimace suggested by a wish to render pictorially the brutality of gaolers and executioners. Yet in every instance an effort is manifest to develop and express individual character. This tendency in Matsys is chiefly illustrated in his pictures of male and female market bankers.
MATTER

(Louvre and Windsor), in which an attempt is made to display concentrated cupidity and avarity. The other tendency to excessive emphasis of tenderness may be seen in two replicas of the "Virgin and Child" at Berlin and Amsterdam, where the ecstatic kiss of the mother is quite unreal. But in these examples there is a remarkable glow of colour which makes up for many defects. Expression of despair is strongly exaggerated in a Loretta at the museum of Vienna. On the whole the best pictures of Matsys are the quietest; his "Virgin and Christ" or "Ecce Homo" and "Mater Dolorosa" (London and Antwerp) display as much serenity and dignity as seems consistent with the master's art. He had considerable skill as a portrait painter. Egidius at Longford, which drew from Sir Thomas More a eulogy in Latin verse, is but one of a numerous class, to which we may add the portrait of Maximilian of Austria in the gallery of Amsterdam. Matsys in this branch of practice was much under the influence of his contemporaries Lucas of Leiden and Mabuse. His tendency to polish and smoothness (see Conduction, Electric) and the subtility of modulation remarkable in Holbein and Dürer. There is reason to think that he was well acquainted with both these German masters. He probably met Holbein more than once on his way to England. He saw Dürer at Antwerp in 1520. Quintin died at Antwerp in 1530. The puritan feeling which slumbered in him was fatal to some of his relatives. His sister Catherine and her husband suffered at Louvain in 1543 for the then capital offence of reading the Bible, he being decapitated, she buried alive in the square fronting the cathedral.

Quintin's son, Jan Matsys, inherited the art but not the skill of his parent. The earliest of his works, a "St Jerome," dated 1537, in the gallery of Vienna, the latest, a "Healing of Tobit," of 1564, in the Louvre, are sufficient evidence of his tendency to substitute imitation for original thought.

MATTEAWAN, a village of Fishkill township, Dutchess county, New York, U.S.A., on the eastern bank of the Hudson river, a little Newburgh and 15 m. S. of Poughkeepsie. Pop. (1890), 4278; (1900), 5803 (1901, foreign-born); (1905, state census), 5584; (1910), 6777. The village is served by the Central New England railway, and is the seat of the Matteawan state hospital for the criminal insane, the Highland hospital, and the Sargent industrial school. The Teller House dates back to the beginning of the 18th century. Near Matteawan is Beacon Hill, the highest of the highlands, which has an electric railway to its summit. There are manufactures of hats, rubber goods, machinery (notably "fuel-economizers"), &c., water-power being furnished by Fishkill Creek. The village owns its water-works, the supply for which is derived from Beacon Hill. Matteawan was incorporated as a village in 1886.

MATTER. Our conceptions of the nature and structure of matter have been profoundly influenced in recent years by investigations on the Conduction of Electricity through Gases and Gases of moderate density. The methods of measurement are sufficiently detailed to enable the reader to judge for himself of the conclusions arrived at. These researches and the ideas which they have suggested have already thrown much light on some of the most fundamental questions connected with matter; they have, too, furnished us with far more powerful methods for investigating many problems connected with the structure of matter than those hitherto available. There is thus every reason to believe that our knowledge of the structure of matter will soon become far more precise and complete than it is at present, for now we have the means of settling by testing directly many points which are still doubtful, but which formerly seemed far beyond the reach of experiment.

The Molecular Theory of Matter—the only theory ever seriously advocated—supposes that all visible forms of matter are collocations of simpler and smaller portions. There has been a continuous tendency as science has advanced to reduce further and further the number of the different kinds of things in which all matter is supposed to be built up. First came the molecular theory teaching us to regard matter as made up of an enormous number of small particles, each kind of matter having its characteristic particle, thus the particles of water were supposed to be different from those of air and indeed from those of any other substance. Then came Dalton's Atomic Theory which taught that these molecules, in spite of their almost infinite variety, were all built up of still smaller bodies, the atoms of the chemical elements, and that the number of different types of these smaller bodies was limited to the sixty or seventy types which represent the atoms of the substance regarded by chemists as elements.

In 1813 Prout suggested that the atoms of the heavier chemical elements were themselves composite and that they were all built up of atoms of the lightest element, hydrogen, so that all the different forms of matter are edifices built of the same material—the atom of hydrogen. If the atoms of hydrogen do not alter in weight when they combine to form atoms of other elements the atomic weights of all elements would be multiples of that of hydrogen; though the number of elements whose atomic weights are multiples or very nearly so of hydrogen is very striking, there are several which are universally admitted to have atomic weights differing largely from whole numbers. We do not know enough about gravity to say whether this is due to the change of weight of the hydrogen atoms when they combine to form other atoms, or whether the primordial form from which all matter is built up is something other than the hydrogen atom. Whatever may be the nature of this primordial form, the tendency of all recent discoveries has been to emphasize the truth of the conception of a common basis of matter of all kinds. That the atoms of the different elements have a common basis, that they behave as if they consisted of different numbers of small particles of the same kind, is proved to most minds by the Periodic Law of Mendeleef and Newlands (see Element). This law shows that the physical and chemical properties of the different elements are determined by their atomic weights, or to use the language of mathematics, the properties of an element are functions of its atomic weight. If we subtract the weight of the atomic nucleus from that of all of the different materials, the atomic weight would be but one factor out of many which would influence the physical and chemical properties of the model, we should require to know more than the atomic weight to fix its behaviour. If we were to plot a curve representing the variation of some property of the substance with the atomic weight we should not expect the curve to be a smooth one, for instance two atoms might have the same atomic weight and yet if they were made of different materials have no other property in common. The influence of the atomic weight on the properties of the elements is nowhere more strikingly shown than in the recent developments of physics connected with the discharge of electricity through gases and with radio-activity. The transparency of bodies to Roentgen rays, to cathode rays, to the rays emitted by radioactive substances, the quality of the secondary radiation emitted by the different elements are all determined by the atomic weight of the element. So much is this the case that the behaviour of the element with respect to these rays has been used to determine its atomic weight, when in the case of Indium, uncertainty as to the valency of the element makes the result of ordinary chemical methods ambiguous.

The radioactive elements indeed furnish us with direct evidence of this unity of composition of matter, for not only does one element uranium, produce another, radium, but all the radioactive substances give rise to helium, so that the substance of the atoms of this gas must be contained in the atoms of the radioactive elements.

It is not radioactive atoms alone that contain a common constituent, for it has been found that all bodies can by suitable treatment, such as raising them to incandescence or exposing them to ultra-violet light, be made to emit negatively electrified particles, and that these particles are the same from whatever source they may be derived. These particles all carry the same charge of negative electricity and all have the same mass; this mass is exceedingly small even when compared with the mass of an atom of hydrogen, which until the discovery of these particles was the smallest mass known to science. These
particles are called corpuscles or electrons; their mass according to the most recent determinations is only about \(1.75 \times 10^{-24}\) that of an ordinary hydrogen, and their radius is only about one hundred-thousandth part of the radius of the hydrogen atom. As corpuscles of this kind can be obtained from all substances, we infer that they form a constituent of the atoms of all bodies. The atoms of the different elements do not all contain the same number of corpuscles—there are more corpuscles in the atoms of the heavier elements than in the atoms of the lighter ones; in fact, many different considerations point to the conclusion that the number of corpuscles in the atom of any element is proportional to the atomic weight of the element. Different methods of estimating the exact number of corpuscles in the atom have all led to the conclusion that this number is of the same order as the atomic weight; that, for instance, the number of corpuscles in the atom of oxygen is not a large multiple of 16. Some methods indicate that the number of corpuscles in the atom is equal to the atomic weight, while the maximum value obtained by any method is only about four times the atomic weight. This is one of the points on which further experiments will have to be carried out to resolve the matter. Thus one of the constituents of all atoms is the negatively charged corpuscle; since the atoms are electrically neutral, this negative charge must be accompanied by an equal positive one, so that on this view the atoms must contain a charge of positive electricity proportional to the atomic weight; the way in which this positive electricity is arranged is a matter of great importance in the consideration of the constitution of matter. The question naturally arises, is the positive electricity done up into definite units like the negative, or does it merely indicate a property acquired by an atom when one or more corpuscles leave it? It is very remarkable that we have up to the present (1910), in spite of many investigations on this point, no direct evidence of the existence of positively charged particles with a mass comparable with that of a corpuscle; the smallest positive particle of which we have any direct indication has a mass equal to the mass of an atom of hydrogen, and it is a most remarkable fact that we get positively charged particles having this mass when we send the electric discharge through gases at low pressures, whatever be the kind of gas. It is no doubt exceedingly difficult to get rid of traces of hydrogen in vessels containing gases at low pressures through which an electric discharge is passing, but the circumstances under which the positively electrified particles just alluded to appear, and the way in which they remain unaltered in spite of all efforts to clear out any traces of hydrogen, all seem to indicate that these positively electrified particles, whose mass is equal to that of an atom of hydrogen, do not come from minute traces of hydrogen present as an impurity but from the oxygen, nitrogen, or helium, or whatever may be the gas through which the discharge passes. If this is so, then the most natural conclusion we can come to is that these positively electrified particles with the mass of the atom of hydrogen are the natural units of positive electricity, just as the corpuscles are those of negative, and that these positive particles form a part of all atoms.

Thus in this way we are led to an electrical view of the constitution of the atom. We regard the atom as built up of units of negative electricity and of an equal number of units of positive electricity; these two units are of very different mass, the mass of the negative unit being only \(1.75 \times 10^{-24}\) of that of the positive. The number of units of either kind is proportional to the atomic weight of the element and of the same order as this quantity. Whether this is anything besides the positive and negative electricity in the atom we do not know. In the present state of our knowledge of the properties of matter it is unnecessary to postulate the existence of anything besides these positive and negative units.

The atom of a chemical element on this view of the constitution of matter is a system formed by \(n\) corpuscles and \(n\) units of positive electricity which is in equilibrium or in a state of steady motion under the electrical forces which the charged \(n\) constituents exert upon each other. Sir J. J. Thomson (Phil. Mag., March 1904, "Corpuscular Theory of Matter") has investigated the systems in steady motion which can be formed by various numbers of negatively electrified particles immersed in a sphere of uniform positive electrification, a case, which in consequence of the enormous volume of the units of positive electricity in comparison with that of the negative has much in common with the problem under consideration, and has shown that some of the properties of \(n\) systems of corpuscles vary in a periodic way suggestive of the Periodic Law in Chemistry as \(n\) is continually increased.

**Mass on the Electrical Theory of Matter.**—One of the most characteristic things about matter is the possession of mass. When we take the electrical theory of matter the idea of mass takes new and interesting forms. This point may be illustrated by the case of a single electrified particle; when this moves it produces in the region around it a magnetic field, the magnetic force being proportional to the velocity of the electrified particle. In a magnetic field, however, there is energy, and the amount of energy per unit volume at any place is proportional to the square of the magnetic force at that place. Thus there will be energy distributed through the space around the moving particle, and when the velocity of the particle is small compared with that of light we can easily show that the energy in the region around the charged particle is \(\frac{\mu e^2}{3a}\), where \(v\) is the velocity of the particle, \(e\) its charge, \(a\) its radius, and \(\mu\) the magnetic permeability of the region round the particle. If \(m\) is the ordinary mass of the particle, the part of the kinetic energy due to the motion of this mass is \(\frac{1}{2} m v^2\), thus the total kinetic energy is \(\frac{1}{2} m (\frac{3}{a} + \mu e^2)\). Thus the electric charge on the particle makes it behave as if its mass were increased by \(\frac{3}{a} \mu e^2\). Since this increase in mass is due to the energy in the region outside the charged particle, it is natural to look to that region for this additional mass. This region is traversed by the tubes of force which start from the electrified body and move with it, and a very simple calculation shows that we should get the increase in the mass which is due to the electrification if we suppose that these tubes of force as they move carry with them a certain amount of the ether, and that this ether had mass. The mass of ether thus carried along must be such that the amount of it in unit volume at any part of the field is such that if this were to move with the velocity of light its kinetic energy would be equal to the potential energy of the electric field in the unit volume under consideration. When a tube moves this mass of ether only participates in the motion at right angles to the tube, it is not set in motion by a movement of the tube along its length. We may compare the mass which a charged body acquires in virtue of its charge with the additional mass which a ball apparently acquires when it is placed in water; a ball placed in water behaves as if its mass were greater than its mass when moving in vacuo; we can easily understand why this should be the case, because when the ball in the water moves the water around it must move as well; so that when a force acting on the ball sets it in motion it has to move some of the water as well as the ball, and thus the ball behaves as if its mass were increased. Similarly in the case of the electrified particle, when it moves it carries with it its lines of force, which grip the ether and carry some of it along with them. When the electrified particle is moved a mass of ether has to be moved too, and thus the apparent mass of the particle is increased. The mass of the electrified particle is thus resident in every part of space reached by its lines of force; in this sense an electrified body may be said to extend to an infinite distance; the amount of the mass of the ether attached to the particle diminishes so rapidly as we recede from it that the contributions of regions remote from the particle die away.

1 We may measure this velocity with reference to any axes, provided we refer the motion of all the bodies which come into consideration to the same axes.
are quite insignificant, and in the case of a particle as small as a corpuscle not one millionth of its mass will be farther away from it than the radius of an atom.

The increase in the mass of a particle due to given charges varies as we have seen inversely as the radius of the particle; thus the smaller the particle the greater the increase in the mass. For bodies of appreciable size or even for those as small as ordinary atoms the effect of any realizable electric charge is quite insignificant, on the other hand for the smallest bodies known, the corpuscle, there is evidence that the whole of the mass is due to the electric charge. This result has been deduced by the help of an extremely interesting property of the mass due to a charge of electricity, which is that this mass is not constant but varies with the velocity. This comes about in the following way. When the charged particle, which for simplicity we shall suppose to be spherical, is at rest or moving very slowly the lines of electric force are distributed uniformly around it in all directions; when the sphere moves, however, magnetic forces are produced in the region around it, while these, in consequence of electro-magnetic induction in a moving magnetic field, give rise to electric forces which displace the tubes of electric force in such a way as to make them set themselves so as to be more at right angles to the direction in which they are moving than they were before. Thus if the charged sphere were moving along the line AB, the tubes of force would, when the sphere was in motion, tend to leave the region near AB and crowd towards a plane through the centre of the sphere and at right angles to AB, where they would be moving more nearly at right angles to themselves. This crowding of the lines of force increases, however, the potential energy of the electric field, and since the mass of the ether carried along by the lines of force is proportional to the potential energy, the mass of the charged particle will also be increased. The amount of variation of the mass with the velocity depends to some extent on the assumptions we make as to the shape of the corpuscle and the way in which it is electrified. The simplest expression connecting the mass with the velocity is that when the velocity is \( v \) the mass is equal to

\[
\frac{m_0 c^2}{\sqrt{1 - \frac{v^2}{c^2}}} - \frac{1}{2} \frac{\mu}{a}
\]

where \( c \) is the velocity of light. We see from this that the variation of mass with velocity is very small unless the velocity of the body approaches that of light, but when, as in the case of the \( \beta \) particles emitted by radium, the velocity is only a few per cent. less than that of light, the effect of velocity on the mass becomes very considerable; the formula indicates that if the particles were moving with a velocity equal to that of light they would behave as if their mass were infinite. By observing the variation in the mass of a corpuscle as its velocity changes we can determine how much of the mass depends upon the electric charge and how much is independent of it. For since the latter part of the mass is independent of the velocity, if it predominates in the variation with velocity of the mass of a corpuscle will be small; if on the other hand it is negligible the variation in mass with velocity will be that indicated by theory given above. The experiment of Kaufmann (Göttingen Nach., Nov. 8, 1901), Bucherer (Ann. der Physik., xxviii. 513, 1900) on the masses of the \( \beta \) particles shot out by radium, as well as those by Hupka (Berichte der deutsch. physik. Gesell., 1900, p. 249) on the masses of the corpuscles in cathode rays are in agreement with the view that the whole of the mass of these particles is due to their electric charge.

The alteration in the mass of a moving charge with its velocity is primarily due to the increase in the potential energy which accompanies the increase in velocity. The connexion between potential energy and mass is general and holds for any arrangement of electrified particles; thus if we assume the electrical constitution of matter, there will be a part of the mass of any system dependent upon the potential energy and in fact proportional to it. Thus every change in potential energy, such for example as occurs when two elements combine with evolution or absorption of heat, must be attended by a change in mass. The amount of this change can be calculated by the rule that if a mass equal to the change in mass were to move with the velocity of light its kinetic energy would equal the change in the potential energy. If we apply this to the case of the combination of hydrogen and oxygen, where the evolution of heat, about \( 1.6 \times 10^{-14} \) ergs per gramme of water, is greater than in any other known case of chemical combination, we see that the change in mass would only amount to one part in \( 10^{30} \) million, which is far beyond the reach of experiment. The evolution of energy by radio-active substances is enormously larger than in ordinary chemical transformations; thus one gramme of radium emits per day about as much energy as is evolved in the formation of one gramme of water, and goes on doing this for thousands of years. We see, however, that even in this case it would require hundreds of years before the changes in mass became appreciable.

The evolution of energy from the gaseous emanation given off by radium is more rapid than that from radium itself, since according to the experiments of Rutherford (Rutherford, Radioactivity, p. 432) a gramme of the emanation would evolve about \( 2 \times 10^{-16} \) ergs in four days; thus by the rule given above would diminish the mass by about one part in 20,000; but since only very small quantities of the emanation could be used the detection of the change of mass does not seem feasible even in this case.

On the view we have been discussing the existence of potential energy due to an electric field is always associated with mass; wherever there is potential energy there is mass. On the electro-magnetic theory of light, however, a wave of light is accompanied by electric forces, and therefore by potential energy; thus waves of light must behave as if they possessed mass. It may be shown that it follows from the same principles that they must also possess momentum, the direction of the momentum being the direction along which the light is travelling; when the light is absorbed by an opaque substance the momentum in the light is communicated to the substance, which therefore behaves as if the light pressed upon it. The pressure exerted by light was shown by Maxwell (Electricity and Magnetism, 3rd ed., p. 440) to be a consequence of his electro-magnetic theory, its existence has been established by the experiment of Lebedew, of Nichols and Hull, and of Poynting.

We have hitherto been considering mass from the point of view that the constitution of matter is electrical; we shall proceed to consider the question of weight from the same point of view. The relation between mass and weight is, while the simplest in expression, perhaps the most fundamental and mysterious property possessed by matter. The weight of a body is proportional to its mass, that is if the weights of a number of substances are equal the masses will be equal, whatever the substances may be. This result was verified to a considerable degree of approximation by Newton by means of experiments with pendulums; later, in 1830 Bessel by a very extensive and accurate series of experiments, also made on pendulums, showed that the ratio of mass to weight was certainly one part in 60,000 the same for all the substances examined by him, these included brass, silver, iron, lead, copper, ivory, water.

The constancy of this ratio acquires new interest when looked at from the point of view of the electrical constitution of matter. We have seen that the atoms of all bodies contain corpuscles, that the mass of a corpuscle is only \( \gamma \gamma_0 \) of the mass of an atom of hydrogen, that it carries a constant charge of negative electricity, and that its mass is entirely due to this charge, and can be regarded as arising from ether gripped by the lines of force starting from the electrical charge. The question at once suggests itself, Is this kind of mass ponderable? does it add to the weight of the body? and, if so, is the proportion between mass and weight the same as for ordinary bodies? Let us suppose for a moment that this mass is not ponderable, so that the corpuscles increase the mass but not the weight of an atom. Then, since the mass of a corpuscle is \( \gamma \gamma_0 \) of that of an atom of hydrogen, the addition or removal of one corpuscle would in the case of an atom of atomic weight \( x \) alter the mass by one part in \( 17 \gamma \gamma_0 x \), without altering the weight, this would produce an effect of the
same magnitude on the ratio of mass to weight and would in the case of the atoms of the lighter elements be easily measurable in experiments of the same order of accuracy as those made by Bessel. If the number of corpuscles in the atom were proportional to the atomic weight, then the ratio of mass to weight would be constant whether the corpuscles were ponderable or not. If the number were not proportional there would be greater discrepancies in the ratio of mass to weight than is consistent with Bessel’s experiments if the corpuscles had no weight. We have seen there are other grounds for concluding that the number of corpuscles in an atom is proportional to the atom weight, so that the constancy of the ratio of mass to weight for a large number of substances does not enable us to determine whether or not mass due to charges of electricity is ponderable or not.

There seems some hope that the determination of this ratio for radio-active substances may throw some light on this point. The enormous amount of heat evolved by these bodies may indicate that they possess much greater stores of potential energy than other substances. If we suppose that the heat developed by one gramme of a radio-active substance in the transformations which it undergoes before it reaches the non-radio-active stage is a measure of the excess of the potential energy in a gramme of this substance above that in a gramme of non-radio-active substance, it would follow that a larger part of the mass was due to electric charges in radio-active than in non-radio-active substances; in the case of uranium this difference would amount to at least one part in 20,000 of the total mass. If this extra mass had no weight the ratio of mass to weight for uranium would differ from the normal amount by more than one part in 20,000, a quantity quite within the range of pendulum experiments. It thus appears very desirable to make experiments on the ratio of mass to weight for radio-active substances. Sir J. J. Thomson, by swinging a small pendulum whose bob was made of radium bromide, has shown that this ratio for radium does not differ from the normal by one part in 2000. The small quantity of radium available prevented the attainment of greater accuracy. Experiments just completed (1910) by Southern at the Cavendish Laboratory on this ratio for uranium show that it is normal to an accuracy of one part in 200,000; indicating that in non-radio-active, as in radio-active, substances the electrical mass is proportional to the atomic weight.

Though but few experiments have been made in recent years on the value of the ratio of mass to weight, many important investigations have been made on the effect of alterations in the chemical and physical conditions on the weight of bodies. These have all led to the conclusion that no change which can be detected by our present means of investigation occurs in the weight of a body in consequence of any physical or chemical changes yet investigated. Thus Landolt, who devoted a great number of years to the question whether any change in weight occurs during chemical combination, came finally to the conclusion that in no case out of the many he investigated did any measurable change of weight occur during chemical combination. Poynting and Phillips (Proc. Roy. Soc., 76, p. 443), as well as Southern (78, p. 393), have shown that change in temperature produces no change in the weight of a body; and Poynting has also shown that neither the weight of a crystal nor the attraction between two crystals depends at all upon the direction in which the axis of the crystal points. The result of these laborious and very carefully made experiments has been to strengthen the conviction that the weight of a given portion of matter is absolutely independent of its physical condition or of its kind of chemical combinations. It should, however, be noticed that our experiments were made as yet upon very small crystals and it is possible that in some cases the weight, whether or not any changes of weight occur during radio-active transformations, such as for example the emanation from radium undergone when the atoms themselves of the substance are disrupted.

It is a matter of some interest in connexion with a discussion of any views of the constitution of matter to consider the theories of gravitation which have been put forward to explain that apparently invariable property of matter—its weight. It would be impossible to consider in detail the numerous theories which have been put forward to account for gravitation; a concise summary of many of these has been given by Drude (Wied. Ann. 62, p. 1): there is no dearth of theories as to the cause of gravitation, what is lacking is the means of putting any of them to a decisive test.

There are, however, two theories of gravitation, both old, which seem to be especially closely connected with the idea of the electrical constitution of matter. The first of these is the theory, associated with the two fluid theory of electricity, that gravity is a kind of residual electrical effect, due to the attraction between the units of positive and negative electricity being a little greater than the repulsion between the units of electricity of the same kind. Thus on this view two charges of equal magnitude, but of opposite sign, would exert an attraction varying inversely as the square of the distance on a charge of electricity of either sign, and therefore an attraction on a system consisting of two charges equal in magnitude but opposite in sign forming an electrically neutral system. Thus if we had two neutral systems, A and B, A consisting of m positive units of electricity and an equal number of negative, while B has n units of each kind, then the gravitational attraction between A and B would be inversely proportional to the square of the distance and proportional to mn. The connexion between this view of gravity and that of the electrical constitution of matter is evidently very close, for if gravity arose in this way the weight of a body would only depend upon the number of units of electricity in the body. On the view that the constitution of matter is electrical, the fundamental units which build up matter are the units of electric charge, and as the magnitude of these charges does not change, whatever chemical or physical vicissitudes matter, the weight of matter ought not to be affected by such changes. There is one result of this theory which might possibly afford a means of testing it: since the charge on a corpuscle is equal to that on a positive unit, the weights of the two are equal; but the mass of the corpuscle is only 1.732 of that of the positive unit, so that the acceleration of the corpuscle under gravity will be 1700 times that of the positive unit, which we should expect to be the same as that for ponderable matter or 981.

The acceleration of the corpuscle under gravity on this view would be $1.6 \times 10^5$. It does not seem altogether impossible that with methods slightly more powerful than those we now possess we might measure the effect of gravity on a corpuscle if the acceleration were as large as this.

The other theory of gravitation to which we call attention is that due to Le Sage of Geneva and published in 1758. Le Sage supposed that the universe was thronged with exceedingly small particles moving with very great velocities. These particles he called ultra-mundane corpuscles, because they came to us from regions far beyond the solar system. He assumed that these were so penetrating that they could pass through masses as large as the sun or the earth without being absorbed to more than a very small extent. There is, however, some absorption, and if bodies are made up of the same kind of atoms, whose dimensions are small compared with the distances between them, the absorption will be proportional to the mass of the body. So that as the ultra-mundane corpuscles stream through the body a small fraction, proportional to the mass of the body, of their momentum is communicated to it. If the direction of the ultra-mundane corpuscles passing through the body were uniformly distributed, the momentum communicated by them to the body would not tend to move it in one direction rather than in another, so that a body, A, alone in the universe, would be at rest. But the bombardment by the ultra-mundane corpuscles would remain at rest. If, however, there were a second body, B, in the neighbourhood of A, B will shield A from some of the corpuscles moving in the direction BA; thus A will not receive as much momentum in this direction as when it was alone; but in this case it only received just enough to...
keep it in equilibrium, so that when B is present the momentum in the opposite direction will get the upper hand and A will move in the direction AB, and will thus be attracted by B. Similarly, we see that B will be attracted by A. Le Sage proved that the rate at which momentum was being communicated to A or B by the passage through them of his corpuscles was proportional to the product of the masses of A and B, and if the distance between A and B was large compared with their dimensions, inversely proportional to the square of the distance between them; in fact, that the forces acting on them would obey the same laws as the gravitational attraction between them.

Similarly, move Clerk Maxwell (article “ATOM,” Ency. Brit., 9th ed.) pointed out that this transference of momentum from the ultra-mundane corpuscles to the body through which they passed involved the loss of kinetic energy by the corpuscles, and if the loss of momentum were large enough to account for the gravitational attraction, the loss of kinetic energy would be so large that if converted into heat it would be sufficient to keep the body white hot. We need not, however, suppose that this energy is converted into heat; it might, as in the case where Röntgen rays are produced by the passage of electrified corpuscles through matter, be transformed into the energy of a still more penetrating form of radiation, which might escape from the gravitating body without heating it. It is a very interesting result of recent discoveries that the machinery which Le Sage introduced for the purpose of his theory has a very close analogy with things for which we have now direct experimental evidence. We know that small particles moving with very high speeds do exist, that they possess considerable powers of penetrating solids, though not, as far as we know at present, to an extent comparable with that postulated by Le Sage; and we know that the energy lost by them as they pass through a solid is to a large extent converted into a still more penetrating form of radiation, Röntgen rays. In Le Sage’s theory the only function of the corpuscles is to act as carriers of momentum, any systems which possessed momentum, moved with a high velocity and had the power of penetrating solids, might be substituted for them; now waves of electric and magnetic force, such as light waves or Röntgen rays, possess momentum, move with a high velocity, and the latter at any rate possess considerable powers of penetration; so that we might formulate a theory in which penetrating Röntgen rays replace Le Sage’s corpuscles. Röntgen rays, however, when absorbed do not, as far as we know, give rise to more penetrating Röntgen rays or to rays of the same kind.

We have confined our attention in this article to the view that the constitution of matter is electrical; we have done so because this view is more closely in touch with experiment than any other yet advanced. The units of which matter is built up on this theory have been isolated and detected in the laboratory, and we may hope to discover more and more of their properties. By seeing whether the properties of matter are or are not such as would arise from a collection of units having these properties, we can apply to this theory tests of a more definite and rigorous character than we can apply to any other theory of matter.

(M. J. T.)

MATTERHORN, one of the best known mountains (14,282 ft.) in the Alps. It rises S.W. of the village of Zermott, and on the frontier between Switzerland (canton of the Valais) and Italy. Though on the Swiss side it appears to be an isolated obelisk, it is really but the butt end of a ridge, while the Swiss slope is not nearly as steep or difficult as the grand terraced walls of the Italian slope. It was first conquered, after a number of attempts chiefly on the Italian side, on the 14th of July 1865, by Mr E. Whymper’s party, three members of which (Lord Francis Douglas, the Rev. C. Hudson and Mr Hadow) with the guide, Michel Croix, perished by a slip on the descent. Three days later it was scaled from the Italian side by a party of men from Val Tournanche. Nowadays it is frequently ascended in summer, especially from Zermatt.

MATTEUCCI, CARLO (1811–1868), Italian physicist, was born at Forli on the 20th of June 1811. After attending the École Polytechnique at Paris, he became professor of physics successively at Bologna (1832), Ravenna (1837) and Pisa (1840). From 1847 he took an active part in politics, and in 1850 was chosen an Italian senator, at the same time becoming inspector-general of the Italian telegraph lines. Two years later he was minister of education. He died near Leghorn on the 25th of June 1868.

He was the author of four scientific treatises: Lezioni di fisica (2 vols., Pisa, 1841), Lezioni sui fenomeni fisicochimici dei corpi viventi (Pisa, 1844), Manuale di telegrafia elettrica (Pisa, 1850), and Cours spécial sur l’induction, le magnetisme de rotation, &c. (Paris, 1856). He has also contributed numerous papers to the most important scientific journals. Among the most important of these are: "Lezioni di fisica," "Lezioni sui fenomeni fisicochimici dei corpi viventi," "Manuale di telegrafia elettrica," "Cours spécial sur l’induction, le magnetisme de rotation, &c." The work of the first two named is especially valuable, as it contains a series of lectures delivered by him at the University of Pisa, on several subjects of great importance. His "Cours spécial" is also valuable, as it contains a series of lectures delivered by him at the University of Paris, on several subjects of great importance. His "Lezioni di fisica" is a valuable contribution to the study of physics, and his "Lezioni sui fenomeni fisicochimici dei corpi viventi" is a valuable contribution to the study of physiology.

MATTHEW, ST (Măthw’os or Matth’nos, probably a shortened form of the Hebrew equivalent to Theodorus), one of the twelve apostles, and the traditional author of the First Gospel, where he is described as having been a tax-gatherer or customs-officer (τέλωνας, x. 3), in the service of the tetrarch Herod. The circumstances of his call to become a follower of Jesus, received as he sat in the "customs house" in one of the towns by the Sea of Galilee—apparently Capernaum (Mark i. 1, 13), are briefly related in ix. 9. We should gather from the parallel narrative in Mark ii. 14, Luke v. 27, that he was at the time known as "Levi the son of Alpheus" (see Simon Cephas, Joseph Barnabas): if so, "James the son of Alpheus" may have been his brother. Possibly "Matthew" (Yahweh's gift) was his Christian surname, since two native names, neither being a patronymic, is contrary to Jewish usage. It must be noted, however, that Matthew and Levi were sometimes distinguished in early times, as by Heracleon (c. 170 A.D.), and more dubiously by Origen (c. 240). Matthew references the word "Matthew" in the Syriac Didascalia (sec. iii.), X. xiv. It has generally been supposed, on the strength of Luke's account (v. 29), that Matthew gave a feast in Jesus' honour (like Zacchaeus, Luke xix. 6 seq.). But Mark (ii. 15), followed by Matthew (ix. 10), may mean that the meal in question was one in Jesus' own home at Capernaum (cf. v. 1). In the lists of the Apostles given in the Synoptic Gospels and in Acts, Matthew ranks third or fourth in the second group of four—a fair index of his relative importance in the apostolic age. The only other facts related of Matthew on good authority concern him as Evangelist. Eusebius (H.E. iii. 24) says that he, like John, wrote only at the spur of necessity. "For Matthew, after preaching to the Hebrews, when about to go also to others, committed to writing in his native tongue the Gospel that bears his name; and so by his writing supplied, for those whom he was leaving, the loss of his presence." The value of this tradition, which may be based on Papias, who certainly reported that "Matthew compiled the Oracles (of the Lord) in Hebrew," can be estimated only in connexion with the study of the Gospel itself (see below). No historical use can be made of the artificial story, in Sanculins 43a, that Matthew was condemned to death by a Jewish court (see Lâle, Christ in the Talmud, 71 seq.). According to the Gnostic Heracleon, quoted by Clement of Alexandria (Strom. iv. 9), Matthew died a natural death. The tradition as to his ascetic diet (in Clem. Alex. Paedag. ii. 16) may be due to confusion with Matthias (cf. Mart. Matthiae, i.). The earliest legend as to his later labours, one of Syrian origin, places them in the Parthian kingdom, where it represents him as dying a natural death at Hierapolis (= Maob on the Euphrates). This agrees with his legend as known to Ambose and Paulinus of Nola, and is the most probable in itself. The legends which make him work with Andrew among the anthropophagi near the Black Sea, or again in Ethiopia (Rufinus, and Socrates, H.E. i. 19), are due to confusion with Matthias, who from the first was associated with Acts with Andrew (see B. Bonet, Acta Apost. apost., 1898, ii. 62). Another
MATTHEW, T.—MATTHEW, GOSPEL OF ST

For the father, see John Le Neve’s Fasti ecclesiae Anglicanæ (London, 1716), and Anthony Wood’s Athenæ Oxonienses. For the son, the notice in Athenæ Oxonienses, an abridgment of his autobiographical Historical Relation of his own life, published by Athelstan Frazer in 1755, was written by Matthew and A. Calhoun, Life of Sir Tobie Matthew (London, 1907).

MATTHEW, GOSPEL OF ST, the first of the four canonical Gospels of the Christian Church. The indications of the use of this Gospel in the two or three generations following the Apostolic Age (see Gospel) are more plentiful than of any of the others. Throughout the history of the Church, also, it has held a place second to none of the Gospels alike in public instruction and in the private reading of Christians. The reasons for its having impressed itself in this way and become thus familiar are in large part to be found in the characteristics noticed below. But in addition there has been from an early time the belief that it was the work of one of those publicans whose heart Jesus touched and of whose call to follow Him the three Synoptics contain an interesting account, but which is best illustrated as Matthew (q.v.) only in this one (Matt. ix. 9-13 = Mark ii. 13-17 = Luke v. 27-32).

1. The Connexion of our Greek Gospel of Matthew with the Apostle whose name it bears.—The earliest reference to a writing by Matthew occurs in a fragment taken by Eusebius from the same work of Papias from which he has given an account of the composition of a record by Mark (Euseb. Hist. Eccl. iii. 39; see Mark, Gospel of ST). The statement about Matthew is much briefer and is harder to interpret. In spite of much controversy, the same measure of agreement as to its meaning cannot be said to have been attained. This is the fragment: “Matthew, however, put together and wrote down the Oracles (ἐν ὁμίλῳ αὐτοῦ ὁμολογημένοι) in the Hebrew language, and each man interpreted them as he was able.” Whether “the elder” referred to in the passage on Mark, or some other like authority, was the source of this statement also does not appear; but it is probable that this was the case from the context in which Eusebius gives it.

EUSEBIUS and other writers on the Gospels have frequently maintained that the writing here referred to was virtually the Hebrew original of our Greek Gospel which bears his name. And it is indeed likely that Papias himself closely associated the latter with the Hebrew (or Aramaic) work by Matthew, of which he had been told, since the traditional connexion of this Greek Gospel with Matthew can hardly have begun later than this time. It is reasonable also to suppose that there was some ground for it. The description, however, of what Matthew did suits better the making of a collection of Christ’s discourses and sayings than the composition of a work corresponding in form and character to our Gospel of Matthew.

The next reference in Christian literature to a Gospel-record by Matthew is that of Irenæus in his famous passage on the four Gospels (Adv. haer. iii. 1). He says that it was written in Hebrew; but in all probability he regarded the Greek Gospel, which stood first in his, as it does in our, enumeration, as in the strict sense a translation of the Apostle’s work; and this was the view of it universally taken till the 16th century, when some of the scholars of the Reformation maintained that the Greek Gospel itself was by Matthew.

The actual phenomena, however, of this Gospel, and of its relation to sources that have been used in it, cannot be explained consistently with either of the two views just mentioned. It is a composite work in which two chief sources, known in Greek to the author of our present Gospel, have, together with some other matter, been combined. It is inconceivable that one of the Twelve should have proceeded in this way in giving an account of Christ’s ministry. One of the chief documents, however, here referred to seems to correspond in character with the description given in Papias’ fragment of a record of the compilation “the gospels themselves” made by Matthew; and the use made of it in our first Gospel may explain the connexion of this Apostle’s name with it. In the Gospel of Luke also, it is true, this same source has been used for the teaching of Jesus. But the original Aramaic Logian document may have been more largely reproduced in our Greek Matthew. Indeed, in the case of one important passage (v. 17-48) this is suggested by a comparison with

For the historical Matthew, see Encyc. Bibl. and Zahn, Introd., to New Test., ii. 506 seq., 522 seq. For his legends, as under Mark. (J. V. B.)

MATTHEW, TOBIAS, or TOBIE (1546-1628), archbishop of York, was the son of Sir John Matthew of Ross in Herefordshire, and of his wife Eleanor Crofton of Ludlow. He was born at Bristol in 1546. He was educated at Wells, and then in succession at University College and Christ Church, Oxford. He proceeded B.A. in 1564, and M.A. in 1566. He attracted the favourable notice of Queen Elizabeth, and his rise was steady though not very rapid. He was public orator in 1560, president of St John’s College, Oxford, in 1572, dean of Christ Church in 1576, vice-chancellor of the university in 1579, dean of Durham in 1583, bishop of Durham in 1595, and archbishop of York in 1606. In 1581 he had a controversy with the Jesuit Edmund Campion, and published at Oxford his arguments in 1638 under the title, Pissimi et eminencissimi viri Tobiae Matthew archiepiscopi olim Eboraecensis concios apologetica advers Campianum. While in the north he was active in forcing the recusants to conform to the Church of England, preaching hundreds of sermons and carrying out thorough visitations. During his later years he was to some extent in opposition to the administration of James I. He was exempted from attendance in the parliament of 1625 on the ground of age and infirmities, and died on the 20th of March 1638. His wife, Frances, was the daughter of William Barlow, bishop of Chester.

He, or Tobie, Matthew (1577-1655), is remembered as the correspondent and friend of Francis Bacon. He was educated at Christ Church, and was early attached to the court, serving in the embassy at Paris. His debts and dissipations were a great source of sorrow to his father, from whom he is known to have received at different times £14,000, the modern equivalent of which is much larger. He was chosen member for Newport in Cornwall in the parliament of 1601, and member for St Albans in 1604. Before this time he had become the intimate friend of Bacon, whom he replaced as member for St Albans. When peace was made with Spain, on the accession of James I., he wished to travel abroad. His family, who feared his conversion to Roman Catholicism, opposed his wish, but he promised not to go beyond France. When once safe out of England he broke his word and went to Italy. The persuasion of some of his countrymen in Florence, one of whom is said to have been the Jesuit Robert Parsons, and a story he heard of the miraculous liquefaction of the blood of San Januario at Naples, led to his conversion in 1666. When he returned to England he was imprisoned, and many efforts were made to obtain his reconversion without success. He would not take the oath of allegiance to the King. In 1688 he was exiled, and remained out of England for ten years, mostly in Flanders and Spain. He returned in 1617, but went abroad again in 1619. His friends obtained his leave to return in 1621. At home he was known as the intimate friend of Gondomar, the Spanish ambassador. In 1623 he was sent to join Prince Charles, afterwards Charles I., at Madrid, and was knighted on the 23rd of October of that year. He remained in England till 1640, when he was finally driven abroad by the parliament, which looked upon him as an agent of the pope. He died in the English college in Ghent on the 13th of October 1655. In 1659 he published an Italian translation of Bacon’s essays. The Essay of Friendship was written for him. He was also the author of a translation of The Confessions of the Incomparable Doctor St Augustine, which led him into controversy. His correspondence was published in London in 1660.
Luke itself, and there are one or two others where from the character of the matter it seems not improbable, especially vi. 1-18 and xxiii. 15-22. On the whole, as will be seen below, what appears to be a Palestinian form of the Gospel-tradition is most fully represented in this Gospel; but in many instances at least this may well be due to some other cause than the use of the original Logian document.

2. The Plan on which the Contents are arranged.—In two respects the arrangement of the book itself is significant. (a) As to the general outline in the first half of the account of the Galilean ministry (Matt. xiii. 1-23), as also in the matter of the call of the first four disciples (iv. 18-22) the evangelist gives not so much an exhaustive summary of the events as an introductory sketch of the whole period, and hence the six discourses between the twelfth and the thirty-fifth chapters (Mark iv. 27-xxvii. 50) are grouped in what may fairly be called an epitome of the teaching of Jesus, and comprises about half the book. The exhortation to the elders of the twelve (xxvii. 1-5) is an instance of the kind required by the disciple of Jesus generally, and a large portion of which probably also stood not far from the beginning of the Logian document. After this he turns to the more immediate history of the Passion, and the events which finally bring him to the cross, and here he seems to have added a considerable number of events which were not in the Logian document, and the result is, after the narrative of the Passion, he gives us the getracht of the kingdom, which shows the deeper interest of the writer, and the last chapter (xviii. 37-xxix. 19) is probably an addition of this kind. (b) In the last chapter (xviii. 37-xxix. 19) the narrative of the Passion, which in the Logian document is somewhat developed, gives place to an account of the history of the Gospels, as the Logian document ends with the words of Jesus at the end of the account of the Passion. The account of the Disciples’ journey to the East is probably not characteristic of the Logian document, but the narrative of the Resurrection and the appearances is such a thing as might be expected to occur in an apocalyptic document after the end of the Passion, and hence the same may be said to be true of the account of the Gospels. The writer himself seems to have added nothing to the Logian document, and the result is that the last chapter contains a considerable number of events which were not in the Logian document, and the result is, after the narrative of the Passion, he gives us the getracht of the kingdom, which shows the deeper interest of the writer, and the last chapter (xviii. 37-xxix. 19) is probably an addition of this kind.

3. The Palestinian Element.—Teaching is preserved in this Gospel which would have peculiar interest and be specially required in the home of Judaism. The best examples of this are the passages already referred to near end of §, as probably derived from the Logian document. There are, besides, a good many versions of expression and sayings peculiar to this Gospel which have a Semitic cast, or which suggest a point of view that would be natural to Palestinian Christians. E.g., "behold of heaven," frequently for "kingdom of God"; xiii. 52 ("every scribe"); xxiv. 20 ("neither on a Sabbath"). See also v. 35 and xix. 9; x. 23. Again, several of the quotations which are peculiar to this Gospel are not taken from the LXX., as those in the other Gospels and in the corresponding contexts in this Gospel commonly are, but are wholly or partly independent renderings from the Hebrew (ii. 6, 15, 18; viii. 17. xii. 21, &c.). Once more, there is somewhat more parallelism between the fragments of the Gospel according to the Hebrews and this Gospel than is the case with Luke, not to say Mark.

4. Doctrinal Character.—In this Gospel, more decided than in either of the other two Synoptics, there is a doctrinal point of view from which the whole history is regarded. Certain aspects which are rare in the Logian Gospel are dwelt upon, and this without there being any great difference between this Gospel and the other two Synoptics in respect to the facts recorded or the beliefs implied. The effect is produced partly by the comments of the evangelist, which especially take the form of citations from the Old Testament; partly by the frequency with which certain expressions are used, and the prominence that is given in this and other ways to particular traits and topics.

He sets forth the restriction of the mission of Jesus during His life on earth to the people of Israel in a way which suggests at first sight a spirit of Jewish exclusiveness. But there are various indications that this is not the true explanation. In particular the evangelist brings out more strongly than either Mark or Luke the national rejection of Jesus, while the Gospel ends with the commission of Jesus to His disciples after His resurrection to "make disciples of all the peoples." One may divine in all this an intention to "justify the ways of God" to the Jew, by proving that God in His faithfulness to His ancient people had given them the first opportunity of salvation through Christ, but that now their national privilege had been rightly forfeited. He was also specially concerned to show that prophecy is fulfilled in the life and work of Jesus, but the conception of this fulfilment which is presented to us is a large one; it is to be seen not merely in particular events or features of Christ’s ministry, but in the whole new dispensation, new relations between God and men, and new rules of conduct which Christ has introduced. The divine meaning of the work of Jesus is thus made apparent, while of the majesty and glory of His person a peculiarly strong impression is conveyed.

Illustrations: detail of these points are subjoined. Where there are parallels in the other Gospels they should be compared and the words in Matthew noted which in many instances serve to emphasize the points in question.

(a) The Ministry of Jesus among the Jewish People as their promised Messiah, their rejection of Him, and the extension of the Gospel to the Gentiles. The mission to Israel: Matt. i. 21; iv. 23 (note in these passages the use of ἀναστήσας, which, here, as generally in Matthew, denotes the chosen nation), i. 33. xi. 35. For the rule limiting...
898 MATTHEW CANTACUZENUS—MATTHEW OF PARIS

the work of Jesus while on earth see xx. 24 (and note ἐξελέων in verse 22, which implies that Jesus had not himself entered the heathen borders), and for a similar rule prescribed to the disciples, x. 5, 6 and 23.

The elevation of Jesus by the people in Galilee, xi. 21; xiii. 13-15, and by the heads of “the nation,” xxvi. 3, 47 and by “the whole nation,” xxvi. 25; their condemnation xxvi. 38.

Mercy to the Gentiles and the punishment of “the sons of the kingdom” is foretold viii. 11, 12. The commission to go among the Gentiles was not given (Matthew xxviii. 19).

(b) The Fulfilment of Prophecy.—In the birth and childhood of Jesus, i. 23; ii. 6, 15, 18, 23. By these citations attention is drawn to the lowliness of the beginnings of the Saviour’s life, the unexpected and remarkable character appearing, to claspers to which from the first He was exposed and from which He escaped.

The ministry of Christ’s forerunner, iii. 3. (The same prophecy, Isa. xi. 3, is also quoted in the other Gospels.)

The quibblers of Jesus. The quibblers have sought to bring out the significance of important events, especially such as were turning-points, and also to mark the broad features of Christ’s life and work, iv. 15, 16; vii. 17; xii. 18 seq.; xii. 35; xii. 5; xvii. 9.

(c) The Teaching on the Kingdom of God.—Note the collection of parables “of the kingdom” in xiii.; also the use of ἡ βασίλεια (the “kingdom”) without further definition as a term the reference of which could not be misunderstood, especially in the following phrases peculiar to Matthew: τοῦ κράτος τῆς βασιλείας (the Gospel of the kingdom) iv. 23, ix. 35, xxiv. 14; and ὁ λόγος τῆς βασιλείας (the “word of the kingdom”) xiii. 19. The following descriptions of the kingdom, peculiar to this Gospel, are also interesting ἡ βασίλεια τοῦ Κυρίου (the king’s kingdom or father kingdom) xiii. 43 and τοῦ κατάρος μου (of my father) xxvi. 29.

(d) The Relation of the New Law to the Old.—Verses 17-48, cf. also, addition at xxii. 40 and xix. 19b. Further, his use of διεσκέισθαι (to divide) xix. 28b (as a term) in this Gospel is such as to connect the New with the Old; the standard in mind is the law which “fulfilled” that previously given.

(e) The Christian Ecclesia.—Chap. xvi. 18, xvi. 17.

(f) The Messianic Dignity and Glory of Jesus.—The narrative in i. and ii. show the royalty of the new-born child. The title “Son of David” occurs with special frequency in this Gospel. The following instances are without parallels in the other Gospels: xxvii. 24; xlviii. 35; xlix. 24. The title “Son of God” is used with somewhat greater frequency than in Mark and Luke: ii. 15; xiv. 33; xvii. 16; xxii. 2 seq. (where it is implied); xxvii. 49, 50, 54, 55, 56. The thought of the future coming of Christ, and in particular of the judgment to be executed by Him then, is much more prominent in this Gospel than in the others. Some of the following predictions are peculiar to it, while in several others there are additional points to the Gospels. xxvii. 21, 22; xxxvi. 20; ili. 2; xxv. 27, 38, 39; xxiv. 31, 35; xxvi. 57; xxvi. 64.

The majesty of Christ is also impressed upon us by the signs at His crucifixion, some of which are related only in this Gospel, xxvii. 51-54; and by the sublime vision of the Risen Christ at the close, xviii. 16-20.

(g) Time of Composition and Readers addressed.—The signs of dogmatic reflection in this Gospel point to its having been composed somewhat late in the 1st century, probably after Luke’s Gospel, and this is in accord with the conclusion that some insertions had been made in the Marcian document used by this evangelist which were not in that used by Luke (see Luke, GOSPEL OF ST.). We may assign A.D. 80-100 as a probable time for the composition.

The author was in all probability a Jew by race, and he would seem to have addressed himself especially to Jewish readers; but they were Jews of the Dispersion. For although he was in specially close touch with Palestine, either personally or through the sources at his command, or both, his book was composed in Greek by the aid of Greek documents.

See commentary by Th. Zahn (1903) and W. C. Allen (in the series of English and American Critical Commentaries, ix. 375); also books on the Four Gospels or the Synoptic Gospels cited at the end of GOSPEL.

MATTHEW CANTACUZENUS, Byzantine emperor, was the son of John VI. Cantacuzenus (q.v.). In return for the support he gave to his father during his struggle with John V. he was allowed to annex part of Thrace under his own dominion and in 1353 was proclaimed joint emperor. From his Thracian principality he levied several wars against the Servians. An attack which he prepared in 1350 was frustrated by the defection of his Turkish auxiliaries. In 1357 he was captured by his enemies, who delivered him to the rival emperor, John V. Compelled to abdicate, he withdrew to a monastery, where he busied himself with writing commentaries on the Scriptures.

MATTHEW OF PARIS (d. 1259), English monk and chronicler known to us only through his voluminous writings. In spite of his surname, and of his knowledge of the French language, his attitude towards foreigners attests that he was of English birth. He may have studied at Paris in his youth, but the earliest fact which he records of himself is his admission as a monk at St Albans in the year 1217. His life was mainly spent in this religious house. In 1248, however, he was sent to Norway as the bearer of a message from Louis IX. of France to Haakon VI.; he made himself so agreeable to the Norwegian sovereign that he was invited, a little later, to superintend the reformation of the Benedictine monastery of St Benet Holme at Trondhjem. Apart from these missions, his activities were devoted to the composition of history, a pursuit for which the monks of St Albans had long been famous. Matthew edited anew the works of Abbot John de Cella and Roger of Wendover, which in their altered form constitute the first part of his most important work, the Chronica majora. From 1235, the point at which Wendover abandoned his pen, Matthew continued the history on the plan which his predecessors had followed. He derived much of his information from the letters of important personages, which he sometimes inserts, but much more from conversation with the eye-witnesses of events. Among his informants were Earl Richard of Cornwall and Henry III. With the latter he appears to have been on terms of intimacy. The king knew that Matthew was writing a history, and showed some anxiety that it should be as exact as possible. In 1257, in the course of a week’s visit to St Albans, Henry kept the chronicler beside him night and day, “and guided my pen,” says Paris, “with much good will and diligence.” It is therefore curious that the Chronica majora should give so unfavourable an account of the king’s policy. Luard supposes that Matthew never intended his work to see the light in its present form, and many passages of the autograph have against them the note offendiculum, which shows that the text was not considered final. On the other hand, unexpurgated copies were made in Matthew’s lifetime; though the offending passages are duly omitted or softened in his abridgment of his longer work, the Historia Anglorum (written about 1253), the real sentiments of the author must have been an open secret. In any case there is no ground for the old theory that he was an official historiographer.

Matthew Paris was unfortunate in living at a time when English politics were peculiarly involved and tedious. His talent is for narrative and description. Though he took a keen interest in the personal details of the palace life and the religious life, he was a judge of character. His appreciations of his contemporaries throw more light on his own prejudices than on their aims and ideas. His work is always vigorous, but he imputes motives in the spirit of a partisan who wishes to connect the court with Rome. The frankness with which he attacks the court of Rome for its exactions is remarkable; so, too, is the intense nationalistic which he displays in dealing with this topic. His faults of presentation are often due to his vehemence in expression, which has a special purpose. But he is sometimes guilty of inserting rhetorical speeches which are not only fictitious, but also misleading as an account of the speaker’s sentiments. In other cases he tampers with the documents (which he inserts) to suit the text of Magna Carta). His chronology is, for a contemporary, inexact; and he occasionally inserts duplicate versions of the same incident in different places. Hence he must always be rigorously checked where other authors are used and used with caution where he is our sole authority. None the less, he gives a more vivid impression of his age than any other English chronicler; and it is a matter for regret that his great history breaks off in 1259, on the eve of the crowning struggle between Henry III and the barons.
Matthew of Westminster—Matthias

Matthew of Westminster, the name of an imaginary person who was long regarded as the author of the Flores Historiarum. The error was first discovered in 1826 by Sir F. Palgrave, who said that Matthew was "a phantom who never existed; and after the truth of this statement was completely proved by H. R. Luard. The name appears to have been taken from that of Matthew of Paris, from whose Chronica majora the earlier part of the work was mainly copied, and from Westminster, the abbey in which the work was partially written. The Flores historiarum is a Latin chronicle dealing with English history from the creation to 1326, although some of the earlier manuscripts end at 1306; it was compiled by various persons, and was partly at St Albans and partly at Westminster. The part from 1000 to 1170 was written by Robert of Reading (d. 1235) and another Westminster monk. Except for parts dealing with the reign of Edward I. its value is not great. It was first printed by Matthew Parker, archbishop of Canterbury, in 1557, and the best edition is the one edited with improvements by H. R. Luard (3rd ed., London, 1890). It has been translated into English by C. D. Yonge (London, 1853). See Luard's introduction, and C. Bémont in the Revue critique d'histoire (Paris, 1891).

Matthews, Stanley (1824–1886), American jurist, was born in Cincinnati, Ohio, on the 21st of July 1824. He graduated from Kenyon College in 1840, studied law, and in 1842 was admitted to the bar of Maury county, Tennessee. In 1844 he became assistant prosecuting attorney of Hamilton county, Ohio; and in 1846–47 edited and published the newspaper, the Cincinnati Herald. He was clerk of the Ohio House of Representatives in 1848–49, a judge of common pleas of Hamilton county in 1850–53, state senator in 1856–58, and U.S. district-attorney for the southern district of Ohio in 1858–61. First a Whig and then a Free-Soiler, he joined the Republican party in 1861. After the outbreak of the Civil War he was commissioned a lieutenant of the 23rd Ohio, of which Rutherford B. Hayes was major; but saw service only with the 57th Ohio, of which he was colonel, and with a brigade which he commanded in the Army of the Cumberland. He resigned from the army in 1863, and was judge of the Cincinnati superior court in 1863–64. He was a Republican presidential elector in 1864 and 1868. In 1872 he joined the Liberal Republican movement, and was temporary chairman of the Cincinnati convention which nominated Horace Greeley for the presidency, but in the campaign he supported Grant. In 1877, as counsel before the Eleventh Judicial Circuit, he opened the argument for the Republican electors of Florida and made the principal argument for the Republican electors of Oregon. In March of the same year he succeeded John Sherman as senator from Ohio, and served until March 1876. In 1881 President Hayes nominated him as associate justice of the Supreme Court, to succeed Noah H. Swayne; there was much opposition, especially in the press, to this appointment, because Matthews had been a prominent railway and corporation lawyer and had been one of the Republican "visiting statesmen" who witnessed the canvass of the vote of Louisiana in 1876; and the nomination had not been approved when the session of Congress expired. Matthews was renominated by President Garfield on the 15th of March, and the nomination was confirmed by the Senate (22 for, 21 against) on the 12th of May. He was an honest, impartial and conscientious judge. He died in Washington on the 2nd of March 1889.

Matthiae, August Heinrich (1769–1853), German classical scholar, was born at Göttingen, on the 9th of December 1769, and educated at the university. He then spent some years as a tutor in Amsterdam. In 1798 he returned to Germany, and in 1802 was appointed director of the Friedrichsgymnasium at Altenburg, which post he held till his death, on the 6th of January 1853. Of his numerous important works the best-known are his Greek Grammar (3rd ed., 1835), translated into English by E. V. Blomfeld (5th ed., by J. Kenrick, 1832), his edition of Euripides (9 vols., 1813–1830), Grundriss der Geschichte der griechischen und römischen Litteratur (3rd ed., 1834, Eng. trans., Oxford, 1841) Lehrbuch für den ersten Unterricht in der Philosophie (3rd ed., 1833), Encyclopädie und Methodologie der Philosophie (1835). His Life was written by his son Constantin (1845). His brother, Friedrich Christian Matthiae (1763–1822), rector of the Frankfort gymnasium, published valuable editions of Seneca's Letters, Aratus, and Dionysius Periegetes.

Matthiæ, the disciple elected by the primitive Christian church, to fill the place in it vacated by Judas Iscariot (Acts i. 21–26). Nothing further is recorded of him in the New Testament. Eusebius (Hist. Eccl., I. xii) says he was, like his competitor, Barsabas Justus, one of the seventy, and the Syriac version of Eusebius calls him throughout Matthiæ but Tolmai, i.e. Bartholomew, without confining him with the Bartholomew who was originally one of the Twelve, and is often identified with the Nathanael mentioned in the Fourth Gospel (Expositio Temporum, ix. 966). Clement of Alexandria says some identified him with Zacchaeus, the Clementine Recognitions identify him with Barnabas, Hilgenfeld thinks he is the same as Nathanael.

Various works—a Gospel, Traditions and Apocryphal Words—were ascribed to him; and there is also extant The Acts of Andrew and Matthias, which places his activity in the "city of the cannibals" in Ethiopia. Clement of Alexandria quotes two sayings from the Traditions: (1) Wonder at the things before you (suggesting, like Plato, that wonder is the first step to new knowledge); (2) If an elect man's neighbour sin, the elect man has sinned.

Matthias (1557–1629), Roman emperor, son of the emperor Maximilian II. and Maria, daughter of the emperor Charles V., was born in Vienna, on the 24th of February 1557. Educated by the diplomat O. G. de Busbecq, he began his public life in 1577, soon after his father's death, when he was invited to assume the government of the Netherlands, then in the midst of the long struggle with Spain. He eagerly accepted this invitation, although it involved a definite breach with his Spanish kinsman, Philip II., and entering Brussels in January 1578 was named governor-general; but he was merely a cipher, and only held the position for about three years, returning to Germany in October 1581. Matthias was appointed governor of Austria in 1593 by his brother, the emperor Rudolph II.; and two years later, when another brother, the archduke Ernst, died, he became a person of more importance as the eldest surviving brother of the unmarried emperor. As governor of Austria Matthias continued the policy of crushing the Protestants, although personally he appears to have been inclined to religious tolerance; and he himself was the instrument of the rising of the peasants in 1555, in addition to representing Rudolph at the Diet of Worms, gaining some fame as a soldier during the Turkish War. A few years later the discontent felt by the members of the Habsburg family at the incompetence of the emperor became very acute, and the lead was taken by Matthias. Obtaining in May 1605 a reluctant consent from his brother, he took over the conduct of affairs in Hungary, where a revolt had broken out, and was formally recognized by the Habsburgs as their head in April 1606, and was promised the succession to the Empire. In June 1606 he concluded the peace of Viena with the rebellious Hungarians, and was thus in a better position to treat with the sultan, with whom peace was made in November. This pacific policy was displeasing to Rudolph, who prepared to renew the Turkish War; but having secured the support of the national party in Hungary and gathered an army, Matthias forced his brother to cede to him this
kingdom, together with Austria and Moravia, both of which had thrown in their lot with Hungary (1608). The king of Hungary, as Matthias now became, was reluctantly compelled to grant religious liberty to the inhabitants of Austria. The strained relations which had arisen between Rudolph and Matthias as a result of these proceedings were temporarily improved, and a formal reconciliation took place in 1610; but affairs in Bohemia soon destroyed this fraternal peace. In spite of the letter of majesty (Majestätbrief) which the Bohemians had extorted from Rudolph, they were very dissatisfied with their ruler, whose troops were ravaging their land; and in 1611 they invited Matthias to come to their aid. Accepting this invitation, he inflicted another humiliation upon his brother, and was crowned king of Bohemia in May 1611. Rudolph, however, was successful in preventing the election of Matthias as German king, or king of the Romans, and when he died, in January 1612, no provision had been made for a successor. Already king of Hungary and Bohemia, however, Matthias obtained the remaining hereditary dominions of the Habsburgs, and in June 1612 was crowned emperor, although the ecclesiastical electors favoured his younger brother, the archduke Albert (1559-1621).

The short reign of the new emperor was troubled by the religious dissensions of Germany. His health became impaired and his indolence increased, and he fell completely under the influence of Melchior Klesl (q.e.), who practically conducted the imperial business. By Klesl's advice he took up an attitude of moderation and sought to reconcile the contending religious parties; but the proceedings at the diet of Regensburg in 1613 proved the hopelessness of these attempts, while their author was regarded with general distrust. Meanwhile the younger Habsburgs, led by the emperor's brother, the archduke Maximilian, and his cousin, Ferdinand, archduke of Styria, afterwards the emperor Ferdinand II, disliked the peaceful policy of Klesl, had allied themselves with the unyielding Roman Catholics, while the question of the imperial succession was forcing its way to the front. In 1611 Matthias had married his cousin Anna (d. 1618), daughter of the archduke Ferdinand (d. 1555), but he was old and childless and the Habsburgs were anxious to retain his extensive possessions in the family. Klesl, on the one hand, wished the settlement of the religious difficulties to precede any arrangement about the imperial succession; the Habsburgs, on the other, regarded the question of the succession as urgent and vital. Meanwhile the disputed succession to the duchies of Cleves and Jülich again threatened a European war; the imperial commands were flouted in Cologne and Aix-la-Chapelle, and the Bohemians were again becoming troublesome. Having decided that Ferdinand should succeed Matthias as emperor, the Habsburgs had secured his election as king of Bohemia in June 1617, but were unable to stem the rising tide of disorder in that country. Matthias and Klesl were in favour of concessions, but Ferdinand and Maximilian met this move by seizing and imprisoning Klesl. Ferdinand had just secured his coronation as king of Hungary where there broke out in Bohemia those struggles which heralded the Thirty Years' War, and on the 20th of March 1619 the emperor died at Vienna.

For the life and reign of Matthias the following works may be consulted: J. Heling, Die Wahl des römischen Königs Matthias (Belgrade, 1892); A. Gindely, Rudolf II. und seine Zeit (Prague, 1862-1868); F. Steebe, Die Verhandlungen über die Nachfolge Kaiser Rudolf II. (Munich, 1868); P. von Capizzi, König Matthias in Westliche und seine Zeit (Brünn, 1862-1879); A. Kerschbaumer, Kardinal Klesl (Vienna, 1865); M. Ritter, Quellenbeiträge zur Geschichte des Kasslers Rudolf II. (Munich, 1872); Deutsche Geschichte im Zeitalter der Renaissance (Wien, 1887, seq.); and the article on Matthias in the Allgemeine deutshe Biographie, Bd. XX. (Leipzig, 1884); L. von Ranke, Zur deutschen Geschichte vom Religionskriege bis zum 30-jährigen Kriege (Leipzig, 1885); Runge, Geschichte der deutschen Völker seit dem Ausgang des Mittelalters (Freiburg, 1878, seq.); Eng. trans, by M. A. MacClure and A. M. Christie (London, 1896, seq.).

MATTHIAS I., HUNYADI (1440-1490), king of Hungary, also known as Matthias Corvinus, a surname which he received from the raven (corvus) on his escutcheon, second son of János Hunyadi and Elizabeth Seillägy, was born at Kolozsvár, probably on the 23rd of February 1440. His tutors were the learned János Vitéz, bishop of Nagyvár, whom he subsequently raised to the primacy, and the Polish humanist Gregory Sanocki. The precocious lad quickly mastered the German, Latin and principal Slavonic languages, frequently acting as his father's interpreter at the reception of ambassadors. His military training proceeded under the eye of his father, whom he began to follow on his campaigns when only twelve years of age. In 1453 he was created count of Bísterecz, and was knighted at the siege of Belgrade in 1454. The same care for his welfare led his father to choose him a bride in the powerful Cilli family, but the young Elizabeth died before the marriage was consummated, leaving Matthias a widower at the age of fifteen. On the death of his father he was inveigled to Buda by the enemies of his house, and, on the pretext of being concerned in a purely imaginary conspiracy against Ladislaus V., was condemned to decapitation, but was spared on account of his youth, and on the king's death fell into the hands of George Podébrad, governor of Bohemia, the friend of the Hunyadis, in whose interests it was that a national king should sit on the Magyar throne. Podébrad treated Matthias hospitably and affianced him with his daughter Catherine, but still detained him, for safety's sake, in Prague, even after a Magyar deputation had hastened thither to offer the youth the crown. Matthias was the elect of the Hungarian people, gratefully mindful of his father's services to the state and inimical to all foreign candidates; and though an influential section of the magnates, headed by the palatine László Garai and the voivode of Transylvania, Miklós Ujlaki, who had been concerned in the judicial murder of Matthias's brother László, and hated the Hunyadis as semi-foreign upstarts, were fiercely opposed to Matthias's election, they were not strong enough to resist the manifest wish of the nation, supported as it was by Matthias's uncle Mihály Szilágyi at the head of 15,000 veterans. On the 24th of January 1458, 40,000 Hungarian noblemen, assembled on the ice of the frozen Danube, unanimously elected Matthias Hunyadi king of Hungary, and on the 14th of February the new king made his state entry into Budapest.

The realm at this time was environed by perils. The Turks and the Venetians threatened it from the south, the emperor Frederick III. from the west, and Casimir IV. of Poland from the north, both Frederick and Casimir claiming the throne. The Czech mercenaries under Giszkra held the northern counties and from thence plundered those in the centre. Meanwhile Matthias's friends had only pacified the hostile dignitaries by engaging to marry the daughter of the palatine Garai to their nominee, whereas Matthias not unnaturally refused to marry into the family of one of his brother's murderers, and on the 9th of February confirmed his previous nuptial contract with the daughter of George Podébrad, who shortly afterwards was elected king of Bohemia (March 2, 1458). Throughout 1458 the struggle between the young king and the magnates, reinforced by Matthias's own uncle and guardian Szilágyi, was acute. But Matthias, who began by suppressing Garai and dismissing Szilágyi, and then proceeded to levy a tax, without the consent of the Diet, in order to hire mercenaries, easily prevailed. Nor did these complications prevent him from recovering the fortress of Galamboc from the Turks, successfully invading Servia, and reasserting the suzerainty of the Hungarian crown over Bosnia. In the following year there was a fresh rebellion, when the emperor Frederick was actually crowned king by the malcontents at Vienna-Neustadt (March 4, 1459); but Matthias drove him out, and Pope Pius II. intervened so as to leave Matthias free to engage in a projected crusade against the Turks, which subsequent political complications, however, rendered impossible. From 1461 to 1465 the career of Matthias was a perpetual struggle punctuated by truces. Having come to an understanding with his father-in-law Podébrad, he was able to turn his arms against the emperor Frederick, and in April 1462 Frederick restored the holy crown for 60,000 ducats and was allowed to retain certain Hungarian counties with the title of king; in return for which concessions, extracted from Matthias by the necessity of coping with a simultaneous rebellion of the Magyar noble
in league with Podébrad’s son Victorinus, the emperor recognized Matthias as the actual sovereign of Hungary. Only now was Matthias able to turn against the Turks, who were again threatening the southern provinces. He began by defeating Ali Pasha, and then penetrated into Bosnia, and captured the newly built fortress of Jajce after a long and obstinate defence (Dec. 1463). On returning home he was crowned with the holy crown on the 29th of March 1464, and, after driving the Czechs out of his northern counties, turned southwards again, this time recovering all the parts of Bosnia which still remained in Turkish hands.

A political event of the first importance now riveted his attention upon the north. Podébrad, who had gained the throne of Bohemia with the aid of the Hussites and Utraquists, had long been in ill odour at Rome, and in 1465 Pope Paul II. determined to depose the semi-Catholic monarch. All the neighbouring princes, the emperor, Casimir IV. of Poland and Matthias, were commanded in turn to execute the papal decree of deposition, and Matthias gladly placed his army at the disposal of the Holy See. The war began on the 31st of May 1468, but, as early as the 27th of February 1469, Matthias anticipated an alliance between George and Frederick by himself concluding an armistice with the former. On the 3rd of May the Czech Catholics elected Matthias king of Bohemia, but this was contrary to the wishes of both Pope and Emperor, who preferred that the partition of Bohemia. But now George discomfited all his enemies by suddenly excluding his own son from the throne in favour of Ladislaus, the eldest son of Casimir IV., thus skillfully enlisting Poland on his side. The sudden death of Podébrad on the 22nd of March 1471 led to fresh complications. At the very moment when Matthias was about to profit by the disappearance of his most capable rival, another dangerous rebellion, headed by the prince and the chief dignitaries of the state, with the object of placing Casimir, son of Casimir IV., on the throne, paralysed Matthias’s foreign policy during the critical years 1470–1471. He suppressed this domestic rebellion indeed, but in the meantime the Poles had invaded the Bohemian domains with 60,000 men, and when in 1474 Matthias was at last able to take the field against them in order to raise the siege of Breslau, he was obliged to fortify himself in an entrenched camp, whence he so skilfully harried the enemy that the Poles, impatient to return to their own country, made peace at Breslau (Feb. 1475) on an uti possidetis basis, a peace subsequently confirmed by the congress of Olmutz (July 1479). During the interval between these peace, Matthias, in self-defence, again made war on the emperor, for Frederick, without a war, which he wisely extended until the end of the year 1474. The war was ended by a large treaty, in which the emperor ceded to Matthias the entire possession of the Saxony and the duchy of Upper Lusatia, and the payment of the annuity of 60,000 florins to Matthias. By the final arrangement made between the contending princes, Matthias recognized Ladislaus as king of Bohemia proper in return for the surrender of Moravia, Silésia and Upper and Lower Lusatia, hitherto component parts of the Czech monarchy, till he should have redeemed them for 400,000 florins. The emperor promised to pay Matthias 100,000 florins as a war indemnity, and recognized him as the legitimate king of Hungary on the understanding that he should succeed him if he died without male issue, a contingency at this time somewhat improbable, as Matthias, only three years previously (Dec. 15, 1476), had married his third wife, Beatrice of Naples, daughter of Ferdinand of Aragon.

The endless turgidations and depredations of the emperor speedily induced Matthias to declare war against him for the third time (1481), the Magyar king conquering all the fortresses in Frederick’s hereditary domains. Finally, on the 1st of June 1485, at the head of 9,000 veterans, he made his triumphal entry into Vienna, which he henceforth made his capital. Styrca, Carinthia and Carniola were next subdued, and Trieste was only saved by the intervention of the Venetians. Matthias consolidated his possession by alliances with the dukes of Saxony and Bavaria, with the Swiss Confederation, and the archbishop of Salzburg, and was henceforth the greatest potentate in central Europe. His far-reaching hand even extended to Italy. Thus, in 1480, when a Turkish fleet seized Otranto, Matthias, at the earnest solicitation of the pope, sent Balazs Magyar to recover the fortress, which surrendered to him on the 10th of May 1481. Again in 1488, Matthias took Ancona under his protection for a treacherous treaty, and did it with a hair of Turkish blood.

Though Matthias’s policy was so predominantly occult that he soon abandoned his youthful idea of driving the Turks out of Europe, he at least succeeded in making them respect Hungarian territory. Thus in 1479 a huge Turkish army, on its return home from ravaging Transylvania, was annihilated at Szászváros (Oct. 13), and in 1480 Matthias recaptured Jajce, drove the Turks from Servia and erected two new military banates, Jajce and Srebrenik, out of reconquered Bosnian territory. On the death of Mahmomed II. in 1481, a unique opportunity for the intervention of Europe in Turkish affairs presented itself. A civil war ensued in Turkey between his sons Bayezid and Jem, and the latter, being worsted, fled to the knights of Rhodes, by whom he was kept in custody in France (see BAYEZID II.). Matthias, as the next-door neighbour of the Turks, claimed the custody of so valuable a hostage, and would have used him as a means of extorting concessions from Bayezid.

But neither the pope nor the Venetians would hear of such a transfer, and the negotiations on this subject greatly embittered Matthias against the Curia. The last days of Matthias were occupied in endeavouring to secure the succession to the throne of his illegitimate son János (see CORVINUS, JÁNOS); but Queen Barbataria, the daughter of John Hunyadi, and the matter was still pending when Matthias, who had long been crippled by gout, expired very suddenly on Palm Sunday, the 4th of April 1490.

Matthias Hunyadi was indisputably the greatest man of his day, and one of the greatest monarchs who ever reigned. The preciosity and universality of his genius impress one the most. Like Napoleon, with whom he has often been compared, he was equally illustrious as a soldier, a statesman, an orator, a legislator and an administrator. But in all moral qualities the brilliant adventurer of the 15th was infinitely superior to the brilliant adventurer of the 19th century. Though naturally passionate, Matthias’s self-control was almost superhuman, and throughout his stormy life, with his innumerable experiences of ingratitude and treachery, he never was guilty of a single cruel or vindictive action. His capacity for work was inexhaustible. Frequently half his nights were spent in reading, after the labour of his most strenuous days. There was no branch of knowledge in which he did not take an absorbing interest, no polite art which he did not cultivate and encourage. His camp was a school of chivalry, his court a nursery of poets and artists. Matthias was a middle-class aristocrat, the son of a landowner, with a large fleshy nose, hair reaching to his heels, and the clean-shaven, heavy chinned face of an early Roman emperor.

See Vilmos Frákó, King Matthias Hunyadi (Hung., Budapest, 1890, German ed., Freiburg, 1891); Ignácacs Académy History of the Hungarian Realm (Hung., vol. i., Budapest, 1904); József Teleki, The Age of the Hunyadis in Hungary (Hung., vols. 3–5, Budapest, 1879–1880). V. Frankh, Life of János Vitéz (Hung., Budapest 1879); Karl Schöber, Die Eroberung Niederösterreichs durch Matthias Corvinus (Vienna, 1879); János Huszár, Matthias’s Black Army (Hung. Budapest, 1890); Antonio Bonomi, Rerum hungaricarum decades (7th ed., Leipzig, 1771); Aeneas Sylvius, Opera (Frankfort, 1481, The Correspondence of King Matthias (Hung. and Lat.), 1893); V. Frankó, The Embassies of Cardinal Carvajal to Hungary (Hung., Budapest, 1889); Marzio Galeotti, De reggiu sapienti et jocius dicte ac factis Mattheis regis (Scripti, reg. hung. 1.)

The above is the best general sketch and is rich in notes; the second somewhat chauvinistic but excellently written; the third the best work for scholars; the seventh, eighth and eleventh are valuable as being contemporaries.

Matthisson, Friedrich von (1761–1831), German poet, was born at Hohendoldeleben near Magdeburg, the son of the village pastor, on the 23rd of July 1761. After studying at the University of Halle, he was appointed in 1781 master at the classical school Philanthropinum in Dessau. This once famous seminary was, however, then rapidly decaying in public favour, and in 1784 Matthisson was glad to accept a travelling tutorship. He lived for two years with the Swiss author Bonstetten at Nyon on the lake of Geneva.
In 1794 he was appointed reader and travelling companion to the princess Louisa of Anhalt-Dessau. In 1812 he entered the service of the king of Württemberg, was ennobled, created counsellor of legation, appointed intendant of the court theatre and chief librarian of the royal library at Stuttgart. In 1828 he retired and settled at Wörlitz near Dessau, where he died on the 12th of March 1831. Matthisson enjoyed for a time a great popularity on account of his poems, Gedichte (1787; 15th ed., 1851; new ed., 1876), which Schiller extravagantly praised for their melancholy sweetness and their fine descriptions of scenery. The verse is melodious and the language musical, but the thought and sentiments they express are too often artificial and insincere. His Adelaide has been rendered famous owing to Beethoven's setting of the song. Of his elegies, Die Elegie in den Ruinen eines alten Bergschlosses is still a favourite. His reminiscences, Erinnerungen (5 vols., 1810–1816), contain interesting accounts of his travels.

Matthisson's Schriften appeared in eight volumes (1822–1839), of which the first contains his poems, the remainder his Erinnerungen; a ninth volume was added in 1853 containing his biography by H. Döring. His Literarischer Nachlass, with a selection from his correspondence, was published in four volumes by F. R. Schoch in 1852.

**MATTING**

**MATTOON**

MATTING,—MATTOON

MATTOON, a city of Coles county, Illinois, U.S.A., in the east central part of the state, about 12 m. south-east of Peoria. Pop. (1890), 6833; (1900), 6622, of whom 430 were foreign-born; (1910 census) 11,456. It is served by the Illinois Central and Cleveland, Cincinnati, Chicago & St Louis railways, which have repair shops here, and by inter-urban electric lines. The
city has a public library, a Methodist Episcopal Hospital, and an Old Folks' Home, the last supported by the Independent Order of Odd Fellows. Mattone is an important shipping point for Indian corn and broom corn, extensively grown in the vicinity, and for fruit and livestock. Among its manufactures are foundry and machine shop products, stoves and bricks; in 1905 the factory product was valued at $1,308,781, an increase of 71.2% over that in 1900. The municipality owns the water-works and an electric lighting plant. Mattone was first settled about 1855, was named in honour of William Mattone, an early landowner, was first chartered as a city in 1857, and was reorganized under a general state law in 1879.

MATTRESS (O.Fr. matelas, mod. matelas; the origin is the Arab. al-materah, cushion, whence Span. and Port. almadrabao, Ital. materasso), the padded foundation of a bed, formed of canvas or other stout material stuffed with wool, hair, flock or straw; in the last case it is properly known as a "palliasse" (Fr. paille, straw; Lat. polae); but this term is often applied to an under-mattress stuffed with substances other than straw. The padded mattress on which lay the feather-bed has been replaced by the "wire-mattress," a network of wire stretched on a wooden or iron frame, which is either a separate structure or a component part of the bedstead itself. The "wire-mattress" has taken the place of the "spring mattress," in which spiral springs support the stuffing. The term "mattress" is used in engineering for a mat of brushwood, faggots, &c., corded together as a foundation or as surface in the construction of dams, jetties, dikes, &c.

Maturin, Charles Robert (1782-1834), Irish novelist and dramatist, was born in Dublin in 1782. His grandfather, Gabriel Jasper Maturin, had been Swift's successor in the deanery of St Patrick. Charles Maturin was educated at Trinity College, Dublin, and became curate of Loughrea and then of St Peter's, Dublin. His first novels, The Fatal Revenge; or, the Family of Montorio (1807), The Wild Irish Boy (1808), The Milestone Chief (1812), were issued under the pseudonym of "Dennis Jasper Murphy." All these were mercilessly ridiculed, but the irregular power displayed in them attracted the notice of Sir Walter Scott, who recommended the author to Byron. Through their influence Maturin's tragedy of Bertram was produced at Drury Lane in 1816, with Kean and Miss Kelly in the leading parts. A French version by Charles Nodier and Baron Taylor was produced in Paris at the Théâtre Favart. Two more tragedies, Manuel (1817) and Fredolfo (1819), were failures, and his poem The Universe (1821) fell flat. He wrote three more novels, Women (1818), Melmoth, the Wanderer (1820), and The Albigenses (1824), Melmoth, which forms its author's title to remembrance, is of the best of them, and has for her a hero of "wandering Jew." Honoré de Balzac wrote a sequel to it under the title of Melmoth réconcilié à l'église (1835). Maturin died in Dublin on the 30th of October 1824.

Matvyeev, Artamon Sergeyevich (1662-1719), Russian statesman and reformer, was one of the greatest of the precursors of Peter the Great. His parentage and the date of his birth are uncertain. Apparently his birth was humble, but, when the obscure figure of the young Artamon emerges into the light of history we find him equipped at all points with the newest ideas, absolutely free from the worst prejudices of his age, a ripe scholar, and even an author of some distinction. In 1671 the tsar Alexius and Artamon were already on intimate terms, and on the retirement of Oroduin-Nashchokin Matvyeev became the tsar's chief counsellor. It was at his house, full of all the women of Moscow and many of the nobles of the court, that Alexius, after the death of his first consort, Martha, met Matvyevev's favourite pupil, the beautiful Natalia Naurushchina, whom he married on the 21st of January 1672. At the end of the year Matvyeev was raised to the rank of obolomichny, and on the 1st of September 1674 attained the still higher dignity of boyar. Matvyevev remained paramount to the end of the reign and introduced play-acting and all sorts of refining western novelties into Muscovy. The deplorable physical condition of Alexius's immediate successor, Theodore III, suggested to Matvyevev the desirability of elevating to the throne the sturdy little tsarевич Peter, then in his fourth year. He purchased the allegiance of the stroyeltsi, or musketeers, and then, summoning the boyars of the council, earnestly represented to them that Theodore, scarce able to live, was surely unable to reign, and urged the substitution of little Peter. But the reactionary boyars, among whom were the near kinsmen of Theodore, proclaimed him tsar and Matvyevev was banished to Pustozersk, in northern Russia, where he remained till Theodore's death (April 27, 1682). Immediately afterwards Peter was proclaimed tsar by the patriarch, and the first ukas issued in Peter's name summoned Matvyevev to return to the capital and act as chief adviser to the tsaritsa Natalia. He reached Moscow on the 15th of May, prepared "to lay down his life for the tsar," and at once proceeded to the head of the Red Staircase to meet and argue with the assembled stroyeltsi, who had been instigated to rebel by the anti-Petrine faction. He had already succeeded in partially pacifying them, when one of their colonels began to abuse the still hesitating and suspicious musketeers. Infuriated, they seized and flung Matvyevev into the square below, where he was hacked to pieces by their comrades.

See R. Nisbet Bain, The First Romanovs (London, 1905); M. P. Bogodin, The First Seventeen Years of the Life of Peter the Great (Russ.), St Petersburg, 1885; S. M. Fokh, The First Tsars (Russ.), St Petersbrg, 1895; L. Shepepovtsev, A. S. Matvyevev as an Educational and Political Reformer (Russ.), St Petersbrg, 1906. (R. N. B.)

Maubeuge, a town of northern France, in the department of Nord, situated on both banks of the Sambre, here canalized, 23½ m. by rail E. by S. of Valenciennes, and about 2 m. from the Belgian frontier. Pop. (1906), town 13,550, commune 21,520. As a fortress Maubeuge has an old enciente of bastion trace which serves as the centre of an important entrenched camp of 18 m. perimeter, constructed for the most part after the war of 1870, but since modernized and augmented. The town has a board of trade arbitration, a communal college, a commercial and industrial school; and there are important foundries, forges and blast-furnaces, together with manufacturers of machine-tools, porcelain, &c. It is united by electric tramway with Hautmont (pop. 12,473), also an important metallurgical centre.

Maubeuge (Malbolitum) owes its origin to a double monastery, for men and women, founded in the 7th century by St Aldegonde relics of whom are preserved in the church. It subsequently belonged to the territory of Hainault. It was burnt by Louis XI, by Francis I, and by Henry II, and was finally assigned to France by the Treaty of Nijmegen. It was fortified at Vauban by the command of Louis XIV., who under Turenne first saw military service there. Besieged in 1703 by Prince Josias of Coburg, it was relieved by the victory of Wattignies, which is commemorated by a monument in the town. It was unsuccessfully besieged in 1814, but was compelled to capitulate, after a vigorous resistance, in the Hundred Days.

Mauch Chunk, a borough and the county-seat of Carbon county, Pennsylvania, U.S.A., on the W. bank of the Lehigh river and on the Lehigh Coal and Navigation Company's Canal, 46 m. by rail W.N.W. of Easton. Pop. (1890), 4101; (1900), 4020 (571 foreign-born); (1910), 3952. Mauch Chunk is served by the Central of New Jersey railway and, at East Mauch Chunk, across the river, connected by electric railway, by the Lehigh Valley railway. The borough lies in the valley of the Lehigh river, along which runs one of its few streets and in another deeply cut valley at right angles to the river; through this second valley east and west runs the main street, on which is an electric railway; parallel to it on the south is High Hill and on the north the top of the opposite hill is the wold of Upper Mauch Chunk, reached by the electric railway. An incline railway, originally used to transport coal from the mines to the river and named the "Switch-Back," now carries tourists up the steep slopes of Mount Pisgah and Mount Jefferson, to Summit Hill, a rich anthracite coal region, with a famous "burning mine," which has been on fire since 1832, and then back. An electric railway to the top of Flagstaff Mountain, built in 1900, was completed in 1901 to Leighton, 4 m. south-
MAUCHLINE—MAUNDY THURSDAY

east of Mauch Chunk, where coal is mined and silk and stones are manufactured, and which had a population in 1900 of 4629, and in 1910 of 5216. Immediately above Mauch Chunk the river forms a horseshoe; on the opposite side, connected by a bridge, is the borough of East Mauch Chunk (pop. 1000, 3458; 1010, 3548); and 2 m. up the river is Glen Onoko, with fine falls and cascades. The principal buildings in Mauch Chunk are the county court house, a county gaol, a Young Men's Christian Association building, and the Dimmick Memorial Library (1890). The borough was long a famous shipping point for coal. It now has ironworks and foundries, and in East Mauch Chunk there are silk mills. The name is Indian and means “Bear Mountain,” this English name being used for a mountain on the east side of the river. The borough was founded by the Lehigh Coal and Navigation Company in 1818. This company began in 1827 the operation of the “Switch-Back,” probably the first railway in the country to be used for transporting coal. In 1831 the town was opened to individual enterprise, and in 1850 it was incorporated as a borough. Mauch Chunk was for many years the home of Asa Packer, the projector and builder of the Lehigh Valley railroad from Mauch Chunk to Easton.

MAULSTICK, a hamlet in the parish of Kirkintilloch, county of Argyll, Scotland. Pop. (1801), 1767. It lies 8 m. E.S.E. of Kilmarnock and 11 m. E. of Ayr by the Glasgow and South-Western railway. It is situated on a gentle slope about 1 m. from the river Ayr, which flows through the south of the parish of Mauchline. It is noted for its manufacture of snuff-boxes and knick-knacks in wood, and of curling-stones. There is also some cabinet-making, besides spinning and weaving, and its horse fairs and cattle markets have more than local celebrity. The parish church, dating from 1829, stands in the middle of the village, and on the green a monument, erected in 1830, marks the spot where five Covenanters were killed in 1685. Robert Burns lived with his brother Gilbert on the farm of Mossgiel, about a mile to the north, from 1784 to 1788. Mauchline kirkyard was the scene of the “Holy Fair”; at “Poosie Nancie’s” (Ages Gibson’s)—still, though much altered, a popular inn—the “Jolly Beggars” held their high jinks; near the church (in the poet’s day an old, barn-like structure) was the Whiteford Arms inn, where on a pane of glass Burns wrote the epitaph on John Dove, the landlord, “Auld Nane Thome” (Old Thomas Dove) to the date of 1744 above the door, nearly faces the entrance to the churchyard; the Rev. William Auld was minister of Mauchline, and “Holy Willie,” whom the poet scoured in the celebrated “Prayer,” was one of “Daddy Auld’s” elders; behind the kirkyard stands the house of Gavin Hamilton, the lawyer and firm friend of Burns, in which the poet was married. The bracel of Balchochmyle, where he met the heroine of his song, “The Lass o’ Balchochmyle,” lie about a mile to the south-east. Adjoining them is the considerable manufacturing town of Catrine (pop. 2340), with cotton factories, bleach fields and brewery, where Dr Matthew Stewart (1717-1785), the father of Dugald Stewart—had a mansion, and where there is a big water-wheel said to be inferior in size only to that of Laxey in the Isle of Man. BarSKimming House, 2 m. south by west of Mauchline, the seat of Lord-President Miller (1771-1789), was burned down in 1882. Near the confluence of the Fal and the Ayr was the scene of Burns’s parting with Highland Mary.

MAUDE, (1862-1882), was born in London and educated at Charterhouse. He began his career as an actor in 1883 in America, and from 1886 to 1905 was co-manager with F. Harrison of the Haymarket Theatre, London. There he became distinguished for his quiet humorous acting in many parts. In 1906 he went into management on his own account, and in 1907 opened his new theatre The Playhouse. In 1888 he married the actress Winifred Emery (b. 1862), who had made her London début as a child in 1875, and acted with Irving at the Lyceum between 1881 and 1887. She was a daughter of Samuel Anderson Emery (1817-1881) and granddaughter of John Emery (1777-1822), both well-known actors in their day.

MAULSTICK, or MAULSTICK, a stick with a soft leather or padded head, used by painters to support the hand that holds the brush. The word is an adaptation of the Dutch maulstok, i.e. the painter’s stick, from maul, a maul.
as being marked by a solemn celebration of the sacrament, the
former does not mention the foot-washing, and the latter merely
alludes to it. Perhaps an indication of it may be discerned as
early as the 4th century in a custom, current in Spain, northern
Italy and elsewhere, of washing the feet of the catechumens
before the end of Lent before their baptism. It was not,
however, universal, and in the 48th canon of the synod of Elvira
(A.D. 306) it is expressly prohibited (cf. Corp. Jur. Can., c. 104,
cons. i. qn. 1). From the 4th century ceremonial foot-washing
became yearly more common, till it was regarded as a necessary
rite, to be performed by the pope, all Catholic sovereigns,
princes and prelates, priests and nobles. In England the king washed
the feet of as many poor men as he was years old, and then distributed
to them meat, money and clothes. At Durham Cathedral, until
the 16th century, every charity-boy had a monk to wash his feet.
At Peterborough Abbey, in 1530, Wolsey made "his maund in
Our Lady's Chapel, having fifty-nine poor men whose feet he
washed and kissed; and after he had wiped them he washed
of the said poor men twelve pence in money, three eels of good
canvas to make them shirts, a pair of new shoes, a cast of red
herrings and three white herrings." Queen Elizabeth performed
the ceremony, the paupers' feet, however, being first washed by
the yeomen of the laundry with warm water and sweet herbs.
James II. was the last English monarch to perform the rite.
William III. delegated the washing to his almoner, and this
was usual until the middle of the 18th century. Since 1754 the foot-
washing has been abandoned, and the ceremony now consists
of the presentation of Maundy money, officially called Maundy
Pennies. These were first coined in the reign of Charles II.
They come straight from the Mint, and have their edges unmilled.
The service which formerly took place in the Chapel Royal,
Whitchall, is now held in Westminster Abbey. A procession
is formed in the nave, consisting of the lord high almoner repres-
enting the sovereign, the clergy and the yeomen of the guard,
the latter carrying white and red purses in baskets. The
clerical clothes formerly given are now commemorated in cash.
The full ritual is gone through by the Roman Catholic archbishop
of Westminster, and abroad it survives in all Catholic countries, a
notable example being that of the Austrian emperor. In the
Greek Church the rite survives notably at Moscow, St Petersburg
and Constantinople. It is on Maundy Thursday that in the
Church of Rome the sacred oil is blessed, and the chrism prepared
according to an elaborate rite which is given in the Pontificale.

MAUPASSANT, HENRI RENÉ ALBERT GUY DE (1850-1893).
French novelist and poet, was born at the Château of Miromesnil
in the department of Seine-Inférieure on the 5th August 1850.
His grandfather, a landed proprietor of a good Loiret family,
owned an estate at Neuville-Champ-d'Oisel near Rouen, and
bequeathed it to his son, a Paris stockbroker, who married Mademoiselle Laume Lepoiéevin. Maupassant was
educated at Yvetot and at the Rouen lycée. A copy of verses
entitled Le Dieu créateur, written during his year of philosophy,
has been preserved and printed. He entered the ministry of
maritime, and was promoted by M. Bardoux to the Cabinet de
l'Instruction publique. A pleasant legend says that, in a report
by his official chief, Maupassant is mentioned as not reaching the
standard of the department in the matter of style. He may very
well have been an unsatisfactory clerk, as he divided his time
between rowing expeditions and attending the literary gatherings
at the house of Gustave Flaubert, who was not, as he is often
alleged to be, connected with Maupassant by any blood tie.
Flaubert was not his uncle, nor his cousin, nor even his godfather,
but merely an old friend of Madame de Maupassant, whom he
had known from childhood. At the literary meetings Maupas-
sant seldom shared in the conversation. Upon those who made
him—Tourgenieff, Alphonse Daudet, Catulle Mendès, José-
María de Heredia and Émile Zola—he left the impression of a
simple young athlete. Even Flaubert, to whom Maupassant
submitted some sketches, was not greatly struck by their talent,
though he encouraged the youth to persevere. Maupassant's
first essay was a dramatic piece twice given at Étretat in 1873
before an audience which included Tourgenieff, Flaubert and
Meilhac. In this indecorous performance, of which nothing
more is heard, Maupassant played the part of a woman. During
the next seven years he served a severe apprenticeship to Flau-
bert, who by this time realized his pupil's exceptional gifts. In
1880 Maupassant published a volume of poems, Des Vers, against
which the public prosecutor of Etampes took proceedings that
were finally withdrawn through the influence of the senator
Corzond. From Flaubert, who had himself been prosecuted
for his first book, Madame Bovary, there came a letter congratulating
the poet on the similarity between their first literary experiences.
Des Vers is an extremely interesting experiment, which shows
Maupassant to us still hesitating in his choice of a medium;
but he recognized that it was not wholly satisfactory, and that its
chief deficiency—the absence of verbal melody—was fatal.
Later in the same year he contributed to the Soirées de Médon,
a collection of short stories by MM. Zola, J.-K. Huysmans, Henry
Céard, Léon Hennique and Paul Alexis; and in Boule de suif
the young unknown author revealed himself to his amazed collab-
orators and to the public as an admirable writer of prose and
a consummate master of the conte. There is perhaps no other
instance in modern literary history of a writer beginning, as a
fully equipped artist, with a genuine masterpiece. This early
success was quickly followed by another. The volume entitled
La Maison Tellier (1881) confirmed the first impression, and
vanquished even those who were repelled by the author's choice of
subjects. In Mademoiselle Figi (1883) he repeated his
previous triumphs as a conteur, and in this same year he, for the
first time, attempted to write on a larger scale. Choosing to
portray the life of a blameless girl, unfortunate in her marriage,
unfortunate in her son, consistently unfortunate in every
circumstance of existence, he leaves her, ruined and prematurely
old, clinging to the tragic hope, which time, as one feels, will bele,
that she may find happiness in her grandson. This picture of an
average woman undergoing the constant agony of disillusion
Maupassant calls Une Vie (1883), and as in modern literature
there is no finer example of cruel observation, so there is no
sadder book than this, while the effect of extreme truthfulness
which it conveys justifies its sub-title—L'Humble vérité.
Certain passages of Une Vie are of such a character that the sale of
the volume at railway bookstalls was forbidden throughout France.
The volume was brought before the chamber of deputies, with
the result of drawing still more attention to the book, and of
advertising the Contes de la bécasse (1883), a collection of stories
as improper as they are clever. Au soleil (1884), a book of
travels which has the eminent qualities of lucid observation and
exact description, was less read than Clair de lune, Miss Harriet,
Les Sauvages Rondoli and Yeule, all published in 1883-1884 when
Maupassant's powers were at their highest level. Three further
collections of short tales, entitled Contes et nouvelles, Monseigneur,
Parent, and Contes du jour et de la nuit, issued in 1885, proved
that while the author's vision was as incomparable as ever, his
felicity had not improved his impeccable form. To 1885 also
belongs an elaborate novel, Bel-ami, the cynical history of a
particularly detestable, brutal scoundrel who makes his way in
the world by means of his handsome face. Maupassant is here
no less vivid in realizing his literary men, financiers and frivolous
women than in dealing with his favourite peasants, boors and
servants, to whom he returned in Toine (1886) and in La Petite
régate (1886). About this time appeared the first symptoms of
the malady which destroyed him; he wrote less, and though the
novel Mont-Oriol (1887) shows him apparently in undiminished
possession of his faculty, L'Horla (1887) suggests that he was
already subject to alarming hallucinations. Restored to some
extent by a sea-voyage, recorded in Sur l'eau (1888), he went
with M. de Flers to the hermitage of La Harpe (1888), a burst of
Rabelaisian humour equal to anything he had ever written.
His novels Pierre et Jean (1888), Fort comme la mort
(1889), and Noire cœur (1890) are penetrating studies touched
with a profounder sympathy than that hitherto distinguished
him; and this softening into pity for the tragedy of life is deepened
in some of the tales included in Inutile beauté (1890). One
of these, Le Champ d'Oliviers, is an unsurpassable example of
MAUPEOU

poignant, emotional narrative. With *La Vie errante* (1890), a volume of travels, Maupassant's career practically closed. *Musette*, a theatrical piece written in collaboration with M. Jacques Normand, was published in 1891. By this time inherited nervous maladies, aggravated by excessive physical exercises and by the imprudent use of drugs, had undermined his constitution. He began to take an interest in religious problems, and for a while made the *Imitation* his handbook; but his misanthropy deepened, and he suffered from curious delusions as to his wealth and rank. A victim of general paralysis, of which *La Folie des grandeurs* was one of the symptoms, he drank the waters at Aix-les-Bains during the summer of 1891, and retired to Cannes, where he purposed passing the winter. The singularities of conduct which had been observed at Aix-les-Bains grew more and more marked. Maupassant's reason slowly gave way. On the 6th of January 1892 he attempted suicide, and was removed to Paris, where he died in the most painful circumstances on the 6th of July 1893. He is buried in the cemetery of Montparnasse. The opening chapters of two projected novels, *L'Angélus* and *L'Amie étrangère*, were found among his papers; these, with *La Paix du ménage*, a comedy in two acts, *Le Père de la maréchaussée*, and *La colporteur* (1890), and *Le couplet* (1890), have been published posthumously. A correspondence, called *Amitié amoureuse* (1897), and dedicated to his mother, is probably unauthentic. Among the prefaces which he wrote for the works of others, only one—an introduction to a French prose version of Mr Swinburne's *Poems and Ballads*—is likely to interest English readers.

Maupassant began as a follower of Flaubert and of M. Zola, but, whatever the masters may have called themselves, they both remained essentially *romantiques*. The pupil is the last of the "naturalists": he even destroyed naturalism, since he did all that can be done in that direction. He had no psychology, no theories of art, no moral or strong social prejudices, no disturbing imagination, no wealth of perplexing ideas. It is no paradox to say that his marked limitations made him the incomparable artist that he was. Undisturbed by any external influence, his marvellous vision enabled him to become a supreme observer, and, given his literary sense, the rest was simple. He prided himself in having no invention; he described nothing that he had not lived. To peasants whom he had known as a boy figure in a score of tales; what he saw in Government offices is set down in *L'Héritage*; from Algiers he gathers the material for *Marcoa*; he drinks the waters and builds up *Mont-Oriol*; he enters journalism, constructs *Bel ami*, and, for the sake of precision, makes his brother, Hervé de Maupassant, sit for the infamous hero's portrait; he sees fashionable society, and, though it wearied him intensely, he transcribes its life in *Fort comme la mort* and *Noire cœur*. Fundamentally he finds all men alike. In every grade he finds the same ferocious, cunning, animal instincts at work: it is not a gay world, but he knows no other; he is possessed by the dread of growing old, of ceasing to enjoy; the horror of death haunts him like a spectre. It is an extremely simple outlook. Maupassant does not prefer good to bad, one man to another; he never pauses to argue about the meaning of life, a senseless thing which has the one advantage of yielding materials for art; his one aim is to discover the hidden aspect of visible things, to relate what he has observed, to give an objective rendering of it, and he has seen so intensively and so serenely that he is the most exact transcriber in literature. And the substance of it is, so the form: his style is exceedingly simple and exceedingly strong; he uses no rare or superfluous word, and is content to use the humblest word if only it conveys the exact picture of the thing seen. In ten years he produced some thirty volumes. With the exception of *Pierre et Jean*, his novels, excellent as they are, scarcely represent him at his best, and of over two hundred *contes* a proportion must be rejected. But enough will remain to vindicate his claim to a permanent place in literature as an unmatched observer and the most perfect master of the short story.

See also F. Brunetière, *Le Roman naturaliste* (1883); J. Lemaitre, *Les Contemporains* (vols. i. v. vi.); R. Doumecq, *Ecritures d'aujourd'hui* (1894); an introduction by Henry James to *The Odd Number ...* (1891); a critical preface by the earl of Crewe to *Pierre et Jean* (1902); A. Symons, *Studies in Prose and Verse* (1904). There are many references to Maupassant in the *Journal des Concourts*, and some correspondence with Marie Bashkirtseff but by print was offered with *Further Memoirs* of that lady in 1901.

MAUPEOU, RENÉ NICOLAS CHARLES AUGUSTIN (1714–1792), chancellor of France, was born on the 25th of February 1714, being the eldest son of René Charles de Maupassant (1688–1775), who was president of the parlement of Paris from 1743 to 1757. He married in 1744 a rich heiress, Anne de Roncherolles, a cousin of Madame d'Epinay. Entering public life, he was his father's right hand in the conflicts between the parlement and Christophe de Beaumont, archbishop of Paris, who was supported by the court. Between 1763 and 1768, dates which cover the revision of the case of Jean Calas and the trial of the comte de Lally, Maupassant was himself president of the parlement. In 1768, through the protection of Choiseul, whose fall two years later was in large measure his work, he became chancellor in succession to his father, who had held the office for a few days only. He determined to support the royal authority against the parlement, which in league with the provincial magistrates was seeking to arrogate to itself the functions of the states-general. He allied himself with the duc d'Aiguillon and Madame du Barry, and secured for a creature of his own, the Abbé Terrail, the office of comptroller-general. The struggle came over the trial of the case of the duc d'Aiguillon, ex-governor of Brittany, and of La Chalotais, procureur général of the province, who had been imprisoned by the governor for accusations against his administration. When the parlement showed signs of hostility against Aiguillon, Maupasson read letters patent from Louis XV. annulling the proceedings. Louis replied to remonstrances from the parlement by a *lit de justice*, in which he demanded the surrender of the minutes of procedure. On the 27th of November 1770 appeared the *Édit de réglement et de discipline*, which was promulgated by the chancellor, forbidding the union of the various branches of the parlement and correspondence with the provincial magistrates. It also made a strike on the part of the parlement punishable by confiscation of goods, and forbade further obstruction to the registration of royal decrees after the royal reply had been given to a first remonstrance. This edict the magistrates refused to register, and it was registered in a *lit de justice* held at Versailles on the 7th of December, whereupon the parlement suspended its functions. After five summonses to return to their duties, the magistrates were surprised individually on the night of the 19th of January 1771 by musketeers, who required them to sign yes or no to a further request to return. Thirty-eight magistrates gave an affirmative answer, but on the exile of their former colleagues by *lettres de cachet* they retracted, and were also exiled. Maupassant installed the council of state to administer justice pending the establishment of six superior courts in the provinces, and of a new parlement in Paris. The *cour des aides* was next suppressed.

Voltaire praised this revolution, applauding the suppression of the old hereditary magistrature, but in general Maupassant's policy was regarded as the triumph of tyranny. The remonstrances of the princes, of the nobles, and of the minor courts, who had been exiled by the new system, were not at the end of 1771 the new system was established, and the Bar, which was its passive resistance, recommenced to plead. But the death of Louis XV. in May 1774 ruined the chancellor. The restoration of the parlements was followed by a renewal of the quarrels between the new king and the magistrature. Maupassant and Terrail were replaced by Malesherbes and Turgoit. Maupassant lived in retreat until his death at Thuon on the 29th of July 1792, having lived to see the overthrow of the *ancien régime*. His work, in so far as it was directed towards the separation of the judicial and political functions and to the reform of the abuses attaching to a hereditary magistrature, was subsequently endorsed by the Revolution; but no justification of his violent methods or defence of his intriguing and avaricious character is possible. He aimed at securing absolute power for Louis XV., but his action was in reality a serious blow to the monarchy.
The chief authority for the administration of Maupertuis is the compte rendu in his own justification presented by him to Louis XVI, in 1789, which included a dossier of his speeches and edicts, and is preserved in the Bibliothèque nationale. These documents, in the possession of his former secretary, C. F. Lebrun, de Plaisance, formed the basis of the judicial system of France as established under the consulate (cf. C. F. Lebrun, Opinions, rapports et choix d'écrits politiques, published posthumously in 1829). See further MAUPERTUIS, Pierre Louis Moreau de (1698-1759), which contains the letters directed against him; Journal hist. de la révolution opérée ... par M. de Maupertuis (7 vols., 1775); the official correspondence of Mercy-Argenteau, the letters of Mme d'Epinay; and Jules Flammarion, Le Chancelier Maupertuis et les parlements (1883).

MAUPERTUIS, Pierre Louis Moreau de (1698-1759), French mathematician and astronomer, was born at Mulo, in the town of Berne, 17th January 1698. When he was seven years of age he had left the army, becoming lieutenant in a regiment of cavalry, and employing his leisure on mathematical studies. After five years he quitted the army and was admitted in 1723 a member of the Academy of Sciences. In 1728 he visited London, and was elected a fellow of the Royal Society. In 1736 he acted as chief of the expedition sent by Louis XV. into Lapland to measure the length of a degree of the meridian (see Earth, Figure 09), and on his return home he became a member of almost all the scientific societies of Europe. In 1740 Maupertuis went to Berlin on the invitation of the king of Prussia, and took part in the battle of Mollwitz, where he was taken prisoner by the Austrians. On his release he returned to Berlin, and thence to Paris, where he was elected director of the Academy of Sciences in 1742, and in the following year was admitted into the Academy. Returning to Berlin in 1744, at the desire of Frederick II., he was chosen president of the Royal Academy of Sciences in 1746. Finding his health declining, he repaired in 1751 to the south of France, but went in 1758 to Basel, where he died on the 27th of July 1759. Maupertuis was unquestionably a man of considerable ability as a mathematician, but his restless, gloomy disposition involved him in constant quarrels, of which his controversies with König and Voltaire during the latter part of his life furnish examples.

The following are his most important works: Sur la figure de la terre (Paris, 1738); Discours sur la paralaxe de la lune (Paris, 1741); Discours sur la figure des astres (Paris, 1742); Éléments de la géographie (Paris, 1742); Lettres sur la comète de 1742 (Paris, 1743); Astronomie nautique (Paris, 1745 and 1746); Vénus physique (Paris, 1745); Essai de cosmologie (Amsterdam, 1750). His Œuvres were published in 1752 at Dresden and in 1756 at Lyons.

MAURANIPUR, a town of British India in Jahnari district, in the United Provinces. Pop. (1901), 17,231. It contains a large community of wealthy merchants and bankers. A special variety of red goat cloth, known as kharma, is manufactured and sold all parts of India.

MAUREL, Abdias (d. 1705), Camisard leader, became a cavalry officer in the French army and gained distinction in Italy; here he served under Marshal Catatin, and on this account he himself is sometimes known as Catinat. In 1702, when the revolt in the Cévennes broke out, he became one of the Camisard leaders, and in this capacity his name was soon known and feared. He refused to accept the peace made by Jean Cavalier in 1704, and after passing a few weeks in Switzerland he returned to France and became one of the chiefs of those Camisards who were still in arms. He was deeply concerned in a plot to capture some French towns, a scheme which, if it was hoped, would be helped by England and Holland. But it failed; Maurel was betrayed, and with three other leaders of the movement was burned to death at Nimes on the 22nd of April 1705. He was a man of both brains and heart, and he was very tall, and boasted he had killed 200 Roman Catholics with his own hand.

MAUREL, Victor (1808- ), French singer, was born at Marseilles, and educated in music at the Paris Conservatoire. He made his début in opera at Paris in 1856, and in London in 1873, and from that time onwards his admirable acting and vocal method established his reputation as one of the finest of operatic baritones. He created the leading part in Verdi's Otello, and was equally fine in Wagnerian and Italian opera.

MAURENBRECHER, Karl Peter Wilhelm (1828-1892), German historian, was born at Bonn on the 21st of December, 1838, and studied in Berlin and Munich under Ranke and Von Sybel, being especially influenced by the latter historian. After doing some research work at Simancas in Spain, he became professor of history at the university of Dorpat in 1857; and was then in turn professor at Königsberg, Bonn and Leipzig. He died at Leipzig on the 6th of November, 1892.

Many of Maurenbrecher's works are concerned with the Reformations, among them being England im Reformationszeitalter (Düsseldorf, 1866); Karl V. und die deutschen Protestanten (Düsseldorf, 1865); Studien über die Geschichte der Reformation in England (Bonn, 1874); and the incomplete Geschichte der Katholischen Reformation (Nordlingen, 1880). He also wrote Den Karles (Berlin, 1876); Grundung des deutschen Reiches 1859-1871 (Leipzig, 1892, and again 1902) and Geschichte der deutschen Königsmäler (Leipzig, 1898). See G. Wolf, Wilhelm Maurenbrecher (Berlin, 1893).

MAURER, Jean Frédéric Phélypeaux, Comte de (1701-1781), French statesman, was born on the 9th of July 1701 at Versailles, being the son of Jérôme de Pontchartrain, secretary of state for the marine and the royal household. Maurepas succeeded to his father's charge at fourteen, and began his functions in the royal household at seventeen, while in 1725 he undertook the actual administration of the navy. Although essentially light and frivolous in character, Maurepas was seriously interested in scientific matters, and he used the best brains of France to apply science to questions of navigation and of naval construction. He was disgraced in 1749, and exiled from Paris for an epigram against Madame de Pompadour. On the accession of Louis XVI., twenty-five years later, he became a minister of state and Louis XVI.'s chief adviser. He gave to Turgot the direction of finance, placed Lamoignon-Malesherbes over the royal household and made Vergennes minister for foreign affairs. At the outset of his new career he showed his weakness by recalling to their functions, in deference to popular clamour, the members of the old parlement ousted by Maupertou, thus reconstituting the most dangerous enemy of the royal power. This step, and his intervention on behalf of the American states, helped to pave the way for the French revolution. Jealous of his personal ascendancy over Louis XVI., he intrigued against Turgot, whose disgrace in 1776 was followed after six months of disorder by the appointment of Necker. In 1781 Maurepas deserted Necker as he had done Turgot, and he died at Versailles on the 21st of November 1781.

Maurepas is credited with contributions to the collection of fables by La Fontaine, as that of the story of the horse and the ass (1742). Four volumes of Mémoires de Maurepas, purporting to be collected by his secretary and edited by J. L. G. Soulavie in 1792, must be regarded as apocryphal. Some of his letters were published in 1902 and some of his fables in the tighe in the Academy of Sciences was pronounced by Condorcet.

MAURER, Georg Ludwig von (1700-1782), German statesman and historian, son of a Protestant pastor, was born at Erpoldzheim, near Dörckheim, in the Rhenish Palatinate, on the 2nd of November 1790. Educated at Heidelberg, he went in 1812 to reside in Paris, where he entered upon a systematic study of the ancient legal institutions of the Germans. Returning to Germany in 1814, he received an appointment under the Bavarian government, and afterwards filled several important official positions. In 1824 he published at Heidelberg his Geschichte des altgermanischen und namentlich allbayrischen öffentlichmännlichen Gerichtsverfahrens, which obtained the first prize of the academy of Munich, and in 1830 he became professor in the university of Munich. In 1829 he returned to official life, and was soon offered an important post. In 1832, when Otto (1783-1858), Duke of I., king of Bavaria, was chosen to fill the throne of Greece, a council of regency was nominated during his minority, and Maurer was appointed a member. He applied himself energetically to the task of creating institutions adapted to the requirements of a modern civilized community; but grave difficulties soon arose and Maurer was recalled in 1834, when he returned to Munich. This loss was a serious one for Greece. Maurer was the ablest, most energetic and most liberal-minded member of the council, and it was through his enlightened
efforts that Greece obtained a revised penal code, regular tribunals and an improved system of civil procedure. Soon after his recall he published Das griechische Volk in öffentlicher, kirchlicher, and privatrechtlicher Beziehung vor und nach dem Freiheitskampf bis zum 31 Juli 1834 (Heidelberg, 1835-1836), a useful source of information for the history of Greece before Otto ascended the throne, and also for the labours of the council of regency to the time of the author’s recall. After the fall of the ministry of Karl von Abel (1788-1839) in 1847, he became chief Bavarian minister and head of the departments of foreign affairs and of justice, but was overthrown in the same year. He died at Munich on the 5th of May 1872. His only son, Conrad von Maurer (1833–1902), was a Scandinavian scholar of some repute, and like his father was a professor at the university of Munich.

Maurer’s most important contribution to history is a series of books on the early institutions of the Germans. These are: Einleitung in die Gesetzgebung, Einzelheiten und Geschichten der öffentlichen Gewalt (Munich, 1854); Geschichte der Markenverfassung in Deutschland (Erlangen, 1856); Geschichte der Freihöfe, der Bauernhöfe, und der Hofverfassung in Deutschland (Erlangen, 1856-1861); Geschichte der Stadterverfassung in Deutschland (Erlangen, 1865-1866); and Geschichte der Städterverfassung in Deutschland (Erlangen, 1869–1871). These works are still important authorities for the early history of the Germans. Among other works on ancient Germany, which have been repeatedly and frequently referred to by Maurer, is his Beitrag zur Geschichte des Schwabenspitzes (Stuttgart, 1839), and Über die Freistätte (plegium liberalis), and die Entstehung der grossen und kleinen Juris in England (Munich, 1848); and Über die deutsche Reichsform und Reichsgeschichte (Munich, 1851).

See K. T. von Heigel, Denkwürdigkeiten des bayrischen Staatsrats G. L. von Maurer (Munich, 1903).

MAURETANIA, the ancient name of the north-western angle of the African continent, and under the Roman Empire also of a large territory eastward of that angle. The name had different significations at different times, but before the Roman occupation, Mauretania comprised a considerable part of the modern Morocco i.e. the northern portion bounded on the east by Algyers. Towards the south we may suppose it bounded by the Atlas range, and it seems to have been regarded by geographers as extending along the coast to the Atlantic as far as the point where that chain descends to the sea, in about 30° N. lat. (Strabo, p. 852).

The magnificent plateau in which the city of Morocco is situated seems to have been unknown to ancient geographers, and there was certainly some cause in this. In the north, on the other hand, the Gaetulians to the south of the Atlas range, on the date-producing slopes towards the Sahara, seem to have owned a precocious subjection to the kings of Mauretania, afterwards to the Roman government. A large part of the country is of great natural fertility, and in ancient times produced large quantities of corn, while the slopes of Atlas were clothed with forests, which, besides other kinds of timber, produced the celebrated ornamental wood called cedrus (Pln. Hist. Nat. 13–96), for tables of which the Romans gave fabulous prices. (For physical geography, see Morocco.)

Mauretania, or Maurasia as it was called by Greek writers, signified the land of the Mauri, a term still retained in the modern name of Morocco. The ancient Mauretania was a distinct and extensive country; but it is probable that all the inhabitants of this northern tract of Africa were kindred races belonging to the great Berber family, possibly with an intermingled fair-skinned race from Europe (see Berbers). This fact is more closely shewn in the coins of the local portion of the remains, and in the Ampsasga, the eastern frontier (Plin. 5. 22; Ptol. 4. 3. 1). Juba and his son Poenuleaus after him reigned till A.D. 40, when the latter was put to death by Caligua, and shortly afterwards Claudius incorporated the kingdom into the Roman state as two provinces, viz. Mauretania Tingitana to the west of the Mulucha and M. Caesariensis to the east of that river, the latter taking its name from the city Caesarea (formerly Iol), which Juba had thus named and adopted as his capital. Thus the dividing line between the two provinces was the same as that which separated Mauretania from Numidia (q.v.). These provinces were governed until the time of Diocletian by imperial procurators, and were occasionally united for military purposes. Under and after Diocletian Mauretania, as the administration was still connected with the provinces of Spain, with which it was in all respects closely connected; while M. Caesariensis was divided by making its eastern part into a separate government, which was called M. Sitifensis from the Roman colony Sitifis.

In the two provinces of Mauretania there were at the time of Pline a number of towns, including seven (possibly eight) Roman colonies in M. Tingitana and eleven in M. Caesariensis; others were added later. These colonies were founded for the purpose of securing civilization against the inroads of the natives, who were not in a condition to be used as material for town-life as in Gaul and Spain, but were under the immediate government of the procurators, retaining their own clan organization. Of these colonies the most important, beginning from the west, were Lixus on the Atlantic, Tingis (Tangier), Rusadir (Mellila, Mellila), Cartenna (Tenes), Iol or Caesarea (Cherchel), Issoum (Algeris), first instance and a communal college. These last, and the one on the coast but the last, which was some distance inland. Besides these there were many municipia or oppida civium romanorum (Plin. 5. 19 seq.), but, as has been made clear by French archaeologists, none of them in the same region. Roman settlement was not so frequent the farther we go west, and M. Tingitana has as yet yielded but scanty evidence of Roman civilization. On the whole Mauretania was in a flourishing condition down to the eruption of the Vindobonensis (Dio, 67. 31) of the Neronian age. The historical remains beyond the Maghreb are not so numerous, but we must remember that number of these were mere villages.

In 1904 the term Mauretania was revived as an official designation by the French government, and applied to the territory north of the lower Senegal under French protection (see Senegal).

To the authorities quoted under Africa, Roman, may be added here Göbel, Die West-kuste Afrikas im Alterthum. (W. W. F.)

MAURIC, a town of central France, capital of an arrondissement in the department of Cantal, 30 m. N.W. of Aurillac by rail. Pop. (1906), 2558. Mauric, built on the slope of a volcanic hill, has a church of the 12th century, and the buildings of an old abbey now used as public offices and dwellings; the town owes its origin to the abbey, founded during the 6th century. It is the seat of a sub-prefect and has a tribunal of first instance and a communal college. There are marble quarries in the vicinity.

MAURICE [or MAURITIUS], ST. (d. c. 286), an early Christian martyr, who, with his companions, is commemorated by the Roman Catholic Church on the 22nd of September. The oldest form of his story is found in the Passio ascribed to Eucherius, bishop of Lyons, c. 450, who relates how the “Thæban” legion commanded by Mauritius was sent to north Italy to reinforce the army of Maximinian. Maximinian wished to use them in persecuting the Christians, but as they themselves were of this faith, they refused, and for this, after having been twice declared as having refused, the legion was exterminated at Octodurum (Martigny) near Geneva. In late versions this legend was expanded and varied, the martyrdom was connected with a refusal to take part in a great sacrifice there. At Octodurum and the name of the town is perhaps derived to the gods Mauto by Gregory of Tours (c. 530–593) speaks of a company of the same legions which suffered at Cologne.

The Magdeburg Centuries, in spite of Mauritius being the patron saint of Magdeburg, declared the whole legend fictitious; J. A. du Bovdri La Légion thébaine (Amsterdam, 1705); J. J. Hottinger in Thebatische Kirchengeschichte (Zürich, 1708); and F. W. Rettberg, Die Thebäer oder Thébains, Jena, 1797, both denied the authenticity of the account. It has been demonstrated its untrustworthiness, while the Bollandists, De Rievo and Joh. Friedrich uphold it. Apart from it the prior improbability of a whole legion being martyred, the difficulties are insuperable. The Thébains throughout the course of their career were not molested, that at no later date have we evidence of the presence of Maximian in the Valais, and that none of the writers nearest to the event (Eusebius, Lactantius, Orosius, Sulpicius Severus) know anything of it. It is of course quite possible that isolated cases of officers being put to death for their faith occurred during Maximian’s reign, and on some such cases the legend may have grown up during the century and a half between Maximian and Eucherius. The cult of St Maurice and the Théban legion is found in Switzerland (where two places bear the name in Valais,
MAURICE—MAURICE OF SAXONY

besides St. Moritz in Grisons), along the Rhine, and in north Italy. The foundation of the abbey of St. Maurice (Aggtenum) in the Valais is usually ascribed to Sisigmund of Burgundy (515). Relics of the saint are preserved here and at Brieg and Turin.

MAURICE (MAURICUS FLAVIUS TIBERIUS) (c. 539–602), East Roman emperor from 582 to 602, was of Roman descent, but a native of Arabissus in Cappadocia. He spent his youth at the court of Justin II, and, having joined the army, fought with distinction in the Persian War (578–581). At the age of forty-three he was declared Caesar by the dying emperor Tiberius II, who bestowed upon him the hand of his daughter Constantina. Maurice brought the Persian War to a successful close by the restoration of Chosroes II to the throne (591). On the northern frontier he at first bought off the Avars by payments which compelled him to exercise strict economy in his general administration, but after 595 inflicted several defeats upon them through his general Crispus. By his strict discipline and his refusal to ransom a captive corps he provoked to mutiny the army on the Danube. The revolt spread to the popular factions in Constantinople, and Maurice consented to abdicate. He withdrew to Chalcedon, but was hunted down and put to death after witnessing the slaughter of his five sons.

The work on military art (στρατηγική) ascribed to him is a contemporary work of unknown authorship (ed. Schefler, Arrianotechnik Maiuri, Wiesbaden, 1964; see Max Jahn, Gesch. d. Kriegswissensch., i. 152–156).

MAURICE (1521–1553), elector of Saxony, elder son of Henry, duke of Saxony, belonging to the Albertine branch of the Wettin family, was born at Freiberg on the 21st of March 1521. In January 1541 he married Agnes, daughter of Philip, landgrave of Hesse. In that year he became duke of Saxony by his father's death, and he continued Henry's work in forwarding the progress of the Reformation. Duke Henry had decreed that his lands should be divided between his two sons, but as a partition was regarded as undesirable the whole of the duchy came to his elder son Maurice; however, made generous provision for his brother Augustus, and the desire to compensate him still further was one of the minor threads of his subsequent policy. In 1542 he assisted the emperor Charles V against the Turks, in 1543 against William, duke of Cleves, and in 1544 against the French; but his ambition soon took a wider range. The harmonious relations which subsisted between the two branches of the Wettins were disturbed by the interference of Maurice in Cleves, a proceeding distasteful to the Saxon elector, John Frederick; and a dispute over the bishopric of Meissen having widened the breach, war was only averted by the mediation of Philip of Hesse and Luther. About this time Maurice seized the idea of securing for himself the electoral dignity held by John Frederick, and his opportunity came when Charles was preparing to attack the league of Schmalkalden. Although educated as a Lutheran, religious questions had never seriously appealed to Maurice. As a youth he had joined the league of Schmalkalden, but this adhesion, as well as his subsequent declaration to stand by the confession of Augustus, cannot be considered as the decision of his mature years. In June 1546 he took a decided step by making a secret agreement with Charles at Regensburg. Maurice promised some rights over the archbishopric of Magdeburg and the bishopric of Halberstadt; immunity, in part at least, for his subjects from the Tridentine decrees; and the question of transferring the electoral dignity was discussed. In return the duke probably agreed to aid Charles in his proposed attack on the league as soon as he could gain the consent of the Saxon estates, or at all events to remain neutral during the impending war. The struggle began in July 1546, and in October Maurice declared war against John Frederick. He secured the formal consent of Charles to the transfer of the electoral dignity and took the field in November. He had gained a few successes when John Frederick hastened from south Germany to defend his dominions. Maurice's ally, Albert Alcibiades, prince of Bayreuth, was taken prisoner at Rochlitz; and the duke, driven from electoral Saxony, was unable to prevent his own lands from being overrun. Salvation, however, was at hand. Marching against John Frederick, Charles V., aided by Maurice, gained a decisive victory at Mühlberg in April 1547, after which the capitulation of Wittenberg John Frederick renounced the electoral dignity in favour of Maurice, who also obtained a large part of his kinsman's lands. The formal investiture of the new elector took place at Augsburg in February 1548.

The plans of Maurice soon took a form less agreeable to the emperor. The continued imprisonment of his father-in-law, Philip of Hesse, whom he had induced to surrender to Charles and whose freedom he had guaranteed, was neither his greatest nor his only cause of complaint. The emperor had refused to complete the humiliation of the family of John Frederick; he had embarked upon a course of action which bored danger to the elector's Lutheran subjects, and his increased power was a menace to the position of Maurice. Assuring Charles of his continued loyalty, the elector entered into negotiations with the emperor, and the Peace of Passau, which Charles gave him a base of operations and enabled him to mask his schemes against the emperor. In 1550 he had been entrusted with the execution of the imperial ban against the city of Magdeburg, and under cover of these operations he was able to collect troops and to concert measures with his allies. Favourable terms were granted to Magdeburg, which surrendered and remained in the power of Maurice, and in January 1552 a treaty was concluded with Henry II. of France at Chambord. Meanwhile Maurice had refused to recognize the Interim issued from Augsburg in May 1548 as binding on Saxony; but a compromise was arranged on the basis of which the Leipzig Interim was drawn up for his lands. It is uncertain how far Charles was ignorant of the elector's preparations, but certainly he was unprepared for the attack made by Maurice and his allies in March 1552. Augsburg was taken, the pass of Ehrenberg was forced, and in a few days the emperor left Innsbruck as a fugitive. Ferdinand undertook to make peace, and the Treaty of Passau, signed in August 1552, was drawn up. Meanwhile Maurice obtained a general amnesty and freedom for Philip of Hesse, but was unable to obtain a perpetual religious peace for the Lutherans. Charles stubbornly insisted that this question must be referred to the Diet, and Maurice was obliged to give way. He then fought against the Turks, and renewed his communications with Henry of France. Returning from Hungary the elector placed himself at the head of the princes who were seeking to check the career of his former ally, Albert Alcibiades, whose depredations were making him a curse to Germany. The rival armies met at Sievershausen on the 6th of July 1553, where after a fierce encounter Albert was defeated. The victor, however, was wounded during the fight and died two days later.

Maurice was a friend to learning, and devoted some of the secularized church property to the advancement of education. Very different estimates have been formed of his character. He has been represented as the saviour of German Protestantism on the one hand, and on the other as a traitor to his faith and country. In all probability he was neither the friend nor the other, but a man of great intelligence and of religious convictions, made good use of the exigences of the time. He was generous and enlightened, a good soldier and a clever diplomatist. He left an only daughter Anna (d. 1577), who became the second wife of William the Silent, prince of Orange.

The elector's Politische Korrespondenz has been edited by E. Brandenburg (Leipzig, 1900–1904); and a sketch of him is given by Roger Ascham in A Report and Discourse of the Affairs and State of Germany (London, 1864–1865). See also F. A. von Langenn, Maurice (Leipzig, 1886); and H. Voigt, Moritz von Sachsen (Leipzig, 1876); E. Brandenburg, Moritz von Sachsen (Leipzig, 1898); S. MAURICE, J. F. D.—MAURICE OF NASSAU

bibliography see Maurenbrecher; and The Cambridge Modern History, vol. ii. (Cambridge, 1903).

MAURICE, JOHN FREDERICK DENISON (1805-1872), English theologian, was born at Nor manton, Suffolk, on the 29th of August, 1805. He was the son of a Unitarian minister, and entered Trinity College, Cambridge, in 1823, though it was then impossible for any but members of the Established Church to obtain a degree. Together with John Sterling (with whom he founded the Apostles' Club) he migrated to Trinity Hall, whence he obtained a first class in civil law in 1827; he then came to London, and gave himself to literary work, writing a novel, Eustace Conyers, and editing the London Literary Chronicle until 1830, and also for a short time the Athenaeum. At this time he was much perplexed as to his religious opinions, and he ultimately found relief in a decision to take a further university course and to seek Anglican orders. Entering Exeter College, Oxford, he took a second class in classics in 1831. He was ordained in 1834, and after a short curacy at Bubbenhall in Warwickshire was appointed chaplain of Guy's Hospital, and became thenceforward a sensible factor in the intellectual and social life of London. From 1839 to 1841 Maurice was editor of the Educational Magazine. In 1841 he took charge of English history and literature in King's College, and to this post he was appointed 1846 was added the chair of divinity. In 1845 he was Boyle lecturer and Warburton lecturer. These chairs he held till 1853. In that year he published Theological Essays, wherein were stated opinions which savoured to the principal, Dr R. W. Jelf, and to the council, of unsound theology in regard to eternal punishment. He had previously been called on to clear himself from charges of heterodoxy brought against him in the Quarterly Review (1851), and had been acquitted by a committee of inquiry. Now again he maintained with great warmth of conviction that his views were in close accordance with Scripture and the Anglican standards, but the council, without specifying any distinct "heresy" and declining to submit the case to the judgment of competent theologians, ruled otherwise, and he was deprived of his professorships. He held at the same time the chaplaincy of Lincoln's Inn, for which he had resigned Guy's (1846-1866), but when he offered to resign this the benchers refused. Nor was he assailed in the incumbency of St. Peter's, Vere Street, which he held for nine years (1856-1865) and wherein he rounded him a circle of thoughtful people. During the early years of this period he was engaged in a hot and bitter controversy with H. L. Mansel (afterwards dean of St Paul's), arising out of the latter's Hampton lecture upon reason and revelation.

During his residence in London Maurice was specially identified with two important movements for education. He helped to found Queen's College for the education of women (1848), and the Working Men's College (1854), of which he was the first principal. He strongly advocated the abolition of university tests (1853), and threw himself with great energy into all that affected the social life of the people. Certain abortive attempts at cooperation among working men, and the movement known as Christian Socialism, were the immediate outcome of his teaching. In 1866 Maurice was appointed professor of moral philosophy at Cambridge, and from 1870 to 1872 was incumbent of St Edmond's in that city. He died on the 1st of April 1872.

He was twice married. His first marriage, in 1837, to the daughter of Dr Warburton, was dissolved in 1840, and he then married the sister of his friend Archdeacon Hare. His son Major-General Sir J. Frederick Maurice (b. 1841), became a distinguished soldier and one of the most prominent military writers of his time.

Those who knew Maurice best were deeply impressed with the spirituality of his character. "Whenever he woke in the night," says his wife, "he was always praying." Charles Kingsley called him "the most beautiful human soul whom God has ever allowed me to meet with." As regards his intellectual attainments we may set Julius Hare's verdict "the greatest mind since Plato" over against Ruskin's "by nature puzzle-headed and indeed wrong-headed." Such contradictory impressions bespeak a life made up of contradictory elements. Maurice was a man of peace, yet his life was spent in a series of conflicts; of deep humility, yet so polemical that he often seemed biased; of large charity, yet bit his attack upon the religious press of his time; a loyal churchman who detested the label "Broad," yet poured out criticism upon the leaders of the Church. With an intense capacity for visualizing the unseen, and a kindly dignity, he combined a large sense of humour. While most of the "Broad Churchmen" were influenced by ethical and emotional considerations in their repudiation of the dogma of everlasting torment, he was swayed by purely intellectual and theological arguments, and in questions of a more general liberty he often opposed the proposed Liberal theologians, though he as often took their side if he saw them hard pressed. He had a wide metaphysical and philosophical knowledge which he applied to the history of theology. He was a strenuous advocate of ecclesiastical control in elementary education, and an opponent of the new school of higher biblical criticism, though so far an evolutionist as to believe in growth and development as applied to the history of nations.

As a preacher, his message was apparently simple; his two great convictions were the fatherhood of God, and that all religious systems which did not accord with it, contradicted it. His Sermons on the New Testament (1848) were written first as a result of a course of lectures which had to be disentangled from the error differentiating them from the doctrines of the Church of England as understood by himself. His love to God as his Father was a passionate adoration which filled his doctrine. His methods of preaching were correspondingly simple. There was no effort to draw out and entertain his hearers, as was customary with other preachers. His object was to make them think. His language was particularly impressive. He propounded in London as Isaiah prophesied to the little towns of Palestine and Syria, "often with dark foreboding, but seeing through all unrest and confusion, with a far sight and a wide heart." At Cambridge Maurice gathered round him a band of earnest students, to whom he directly taught much that was valuable drawn from wide stores of his own reading, wide rather than deep, for he was a much greater critic than learned man. Still more did he encourage the habit of inquiry and research, more valuable than his direct teaching. In his Socratic power of convincing his pupils of their ignorance he did more than perhaps any other man of his time to awaken in those who came under his sway the desire for knowledge and the spirit of independent thought.

As a social reformer, Maurice was before his time, and gave his eager support to schemes for which the world was not ready. From an early period of his life in London the condition of the poor was of absorbing interest to him, and upon him the consuming force; the enormous magnitude of the social questions involved was a burden which he could hardly bear. For many years he was the clergyman whom working men of all opinions seemed to trust even if their faith in other religious movements was a little less than solid. He thought he had a marvellous power of attracting the zealous and the outcasts. His works cover nearly 40 volumes, often obscure, often tautological, and with no great distinction of style. But their high purpose, their broad and philosophical outlook give his writings a place in the history of the thought of his time. The following are the more important works—some of them were rewritten and in a measure recast, and the date given is not necessarily that of the first appearance of the book, but of its more complete and abridging form: Eustace Conyers, or the Brother and Sister, a novel (1834); The Kingdom of Christ (1842); Christmas Day and Other Sermons (1843); The Unity of the New Testament (1844); The Epistle to the Hebrews (1846); The Religion of the World (1849); and Metaphysical Philosophy (1851, 1852) in an article in the Encyclopædia Metropolitana, 1848; The History of the Church from the Day of St Paul's (1850); The Old Testament (1851); Theological Essays (1853); The Prophets and Kings of the Old Testament (1853); Lectures on Ecclesiastical History (1854); TheREENE, Savages and Sacrificers (1855); The Prophecies of Isaiah (1856); The Prophets and Kings of the Old Testament (1857); The Epistles of St Paul (1857); The Commandments as Instruments of National Reformation (1860); On the Gospel of St Luke (1862); The Consciences: Lectures on Cassiopie (1866); The Lord's Prayer, with an essay upon the threefold use of prayer (1868); The Epistle to the Romans (1871); Works, in 12 vols.; The Church of England and the Church of Rome (2 vols., 1874); The Church of England and the Church of Rome (2 vols., 1874); The Church of England and the Church of Rome (2 vols., 1874); The Church of England and the Church of Rome (2 vols., 1874); The Church of England and the Church of Rome (2 vols., 1874); The Church of England and the Church of Rome (2 vols., 1874).

MAURICE OF NASSAU, prince of Orange (1567-1625), the second son of William the Silent, by Anna, only daughter of the famous Maurice, elector of Saxony, was born at Dillenburg. At the time of his father's assassination in 1584 he was being educated at the university of Leiden, at the expense of the states of Holland and Zeeland. Despite his youth he was made stadtholder of those two provinces and president of the council of
state. During the period of Leicester's governorship he remained in the background, engaged in acquiring a thorough knowledge of the military art. In 1586 the States of Holland conferred upon him the title of prince. On the withdrawal of Leicester from the Netherlands in August 1587, Johan van Oldenbarneveldt, the advocate of Holland, became the leading statesman of the country, a position which he retained for upwards of thirty years. He had been a devoted adherent of William the Silent and he now used his influence to forward the interests of Maurice. In 1588 he was appointed by the States-General captain and admiral-general of the Union, in 1590 he was elected stadtholder of Utrecht and Oversyel, and in 1591 of Gelderland. From this time forward, Oldenbarneveldt at the head of the civil government and Maurice in command of the armed forces of the republic worked together in the task of rescuing the United Netherlands from Spanish domination (for details see HOLLAND). Maurice soon showed himself to be a general second in skill to none of his contemporaries. He was especially famed for his consummate knowledge of the science of sieges. The twelve years' truce on the 9th of April 1609 brought to an end the cordial relations between Maurice and Oldenbarneveldt. Maurice was opposed to the truce, but the advocate's policy triumphed and henceforward there was enmity between them. The theological disputes between the Remonstrants and contra-Remonstrants found them on different sides; and the theological quarrel soon became a political one. Oldenbarneveldt, supported by the states of Holland, came forward as the champion of provincial sovereignty against that of the states-general; Maurice threw the weight of his sword on the side of the union. The struggle was a short one, for the army obeyed the general who had so often led them to victory. Oldenbarneveldt perished on the scaffold, and the share which Maurice had in securing the illegal condemnation by a packed court of judges of the aged patriot must ever remain a stain upon his memory.

Maurice, who had on the death of his elder brother Philip William, in February 1618, become prince of Orange, was now supreme in the state, but during the remainder of his life he sorely missed the wise counsels of the experienced Oldenbarneveldt. War broke out again in 1621, but success had ceased to accompany him on his campaigns. His health gave way, and he died, a prematurely aged man, at the Hague on the 4th of April 1625. He was buried by his father's side at Delft.

MAURISTS, a congregation of French Benedictines called after St Maurice (d. 365), a disciple of St Benedict and the legendary introducer of the Benedictine rule and life into Gaul. At the end of the 16th century the Benedictine monasteries of France had fallen into a state of disorganization and relaxation. In the abbey of St Vaune near Verdun a reform was initiated by Dom Didier de la Cour, which spread to other houses in Lorraine, and in 1604 the reformed congregation of St Vaune was established, the most distinguished members of which were Ceillier and Calmet. A number of French houses joined the new congregation; but as Lorraine was still independent of the French crown, it was considered desirable to form on the same lines a separate congregation for France. Thus in 1621 was established the famous French congregation of St Maurice. Most of the Benedictine houses of France, except those belonging to Cluny, gradually joined the new congregation, which eventually embraced nearly two hundred houses. The chief house was Saint-Germain-des-Prés, Paris, the residence of the superintendant of the monastery and general centre of the literary activity of the congregation.

1 His festival is kept on the 15th of January. He founded the monastery of Glaneufl or St Maur-sur-Loire.

The primary idea of the movement was not the undertaking of literary and historical work, but the return to a strict monastic regime and the faithful carrying out of Benedictine life; and throughout the most glorious period of Maurist history the literary work was not allowed to interfere with the due performance of the choral office and the other duties of the monastic life. Towards the end of the 18th century a tendency crept in, in some quarters, to relax the monastic observances in favour of study; but the constitutions of 1770 show that a strict monastic regime was maintained until the end. The course of Maurist history and work was checked by the ecclesiastical controversies that distracted the French Church during the 17th and 18th centuries. Some of the members identified themselves with the Jansenist cause; but the bulk, including nearly all the greatest names, pursued a middle path, opposing the lax moral theology condemned in 1679 by Pope Innocent XI., and adhering to those strong views on grace and predestination associated with the Augustinian and Thomist schools of Catholic theology; and like all the theological faculties and schools on French soil, they were bound to teach the four Gallican articles. It is seems that towards the end of the 18th century a rationalistic and free-thinking spirit invaded some of the houses. The congregation was suppressed and the monks scattered at the revolution, the last superior-general with forty of his monks dying on the scaffold in Paris. The present French congregation of Benedictines initiated by Dom Guéranger in 1833 is a new creation and has no continuity with the congregation of St Maur.

The great claim of the Maurists to the gratitude and admiration of posterity is their historical and critical school, which stands quite alone in history, and produced an extraordinary number of colossal works of erudition which still are of permanent value. The foundations of this school were laid by Dom Tarisse, the first superior-general, who in 1652 issued instructions to the superiors of the monasteries to train the young monks in the habits of research and of organized work. The pioneers in production were Ménard and d'Acchery.

The following tables give, divided into groups, the most important Maurist works, along with such information as may be useful to students. All works are folio when not otherwise noted:

The 58 works in the above list comprise 140 great folio volumes and
39 in 4° or 8°. The full Maurist bibliography contains the names of
some 220 writers and more than 700 works. The lesser works in
large measure cover the same fields as those in the list, but the
number of works purely religious character, of piety, devotion
and divination, is very striking. Perhaps the most wonderful
phenomenon of Maurist work is that what was produced was only a portion
of what was contemplated and prepared for. The French Revolution cut short
many gigantic undertakings, the collected materials for which
filled hundreds of manuscript volumes in the Bibliothèque nationale
of Paris and other libraries of France. There are at Paris 31 volumes
of Bertherat’s materials for the Historians of the Crusades, not only
in Latin and Greek, but in the oriental tongues; from them have been
taken in great measure the Recueil des historiens des croissants.

whereof 15 folio volumes have been published by the Académie
des Inscriptions. There exist also the preparations for an edition
of Rufinus and one of Eusebius, and for the continuation of the
Papal Letters and of the Concilia Galliae. Dom Caffiaux and Dom Ville-
vieille left 236 volumes of materials for a Trésor de l’histoire des
There are Benedictine Antiquités (37 vols.), a Monasticon Gallicanum
and a Monasticon Benedictinum (54 vols.). Of the Histories of the
Provinces of France barely half a dozen were printed, but all were
in the Broadman collection, MSS. Of the 800 volumes of MSS,
The materials for a geography of Gaul and France in 50 volumes
perished in a fire during the Revolution.

When these figures were considered, and when one contemplates
the vastness of the works in progress during any decade of the
century 1680-1780; and still more, when not only the quantity but the
quality of the work, and the abiding value of most of it is realized,
will be recognized that the output was prodigious and unique in
the annals of lettered industry coming from a single society. The qualities
that have made Maurist work proverbial for sound learning are
its fine critical tact and its thoroughness.

The chief source of information on the Maurists and their work
is Dom Tassin’s Histoire littérale de la congrégation de Saint-Maur
(1720): it has been reduced to a bare bibliography and completed by
de Lama, Bibliothèque des écrivains de la congr., de S.-M. (1882).
The two works of de Broglie, Mabillon (2 vols., 1888) and Montefaucon
(2 vols., 1891), give a charming picture of the inner life of the great
Maurists, and the earlier ten in the midst of their work and their
friends. Sketches of the lives of a few of the chief Maurists will be
found in McCarthy’s Principal Writers of the Cong. of S. M. (1868).
Useful information about their literary undertakings will be found in
Latomus, Bibl. des Chartes, le Nourry’s, and Zockler’s, and
of the latter an interesting appreciation by the Protestant historian Otto
Zöckler of the spirit and the merits of the work of the Maurists.

(E. C. B.)

MAURITIUS, an island and British colony in the Indian Ocean
(known whilst a French possession as the Ile de France). It
lies between 25° 18’ and 57° 49’ E., and 10° 58’ and 26° 32’ S.,
530 m. E. of Madagascar, 2300 m. from the Cape of Good Hope,
and 9300 m. from England via Suez. The island is irregularly
elliptical—somewhat triangular—in shape, and is 36 m. long
from N.N.E. to S.S.W., and about 25 m. broad. It is 130 m. in
circumference, and its total area is about 110 sq. m. (For
map see MADAGASCAR.) The island is surrounded by coral
reefs, so that the ports are difficult of access.

From its mountainous character Mauritius is a most pic-
turesque island, and its scenery is very varied and beautiful.
It has been admirably described by Bernardin de St Pierre, who
lived in the island towards the close of the 18th century, in
Paul et Virginie. The most level portions of the coast districts
are the north and north-east, all the rest being broken by hills,
which vary from 500 to 2700 ft. in height. The principal
mountain masses are the north-western or Pouce range, in the
district of Port Louis; the south-western, in the districts of
Rivière Noire and Savanne; and the south-eastern range, in the
Grand Port district. In the first of these, which consists of one
principal ridge with several lateral spurs, overlooking Port
Louis, are the singular peak of the Pouce (2650 ft.), so-called
from its supposed resemblance to the human countenance; and the
still loftier, Peter Botte (2685 ft.), a tall obelisk of bare rock,
crowned with a globular mass of stone. The highest summit in
the island is in the south-western mass of hills, the Piton de la
Rivière Noire, which is 2711 ft. above the sea. The south-
eastern group of hills consists of the Montagne du Bambou, with
several spurs running down to the sea. In the interior are
extensive fertile plains, some 1200 ft. in height, forming the
districts of Moka, Vaclins, and Plaines Willums; and from nearly
the centre of the island an abrupt peak, the Piton du Milieu de
l’Ile rises to a height of 1932 ft. Other prominent summits are the
Trois Mamelles, the Montagne du Corps de Garde, the Signal
Mountain, near Port Louis, and the Mornre Brabant, at the south-
west corner of the island.

The rivers are small, and none is navigable beyond a few
hundred yards from the sea. In the dry season little more
than brooks, they become raging torrents in the wet season.
The principal stream is the Grande Rivière, with a course of
about 10 m. There is a remarkable and very deep lake, called
Grand Bassin, in the south of the island, it is probably the extinct crater of an ancient volcanic; similar lakes are the Mare aux Vacois and the Mare aux Joncs, and there are other deep hollows which have a like origin.

Geology.—The island is of volcanic origin, but has ceased to show signs of volcanic activity. All the rocks are of basalt and greyish-tinted lavas, excepting some beds of upraised coral. Columnar basalt is seen in several places. The remains of ancient craters can be distinguished; one of them called the Panoramic Crater is now the Black River Mountains, at a height of about 1200 ft., is a clay-slate; and near Midlands, in the Grand Port group of mountains, a chlortic schist occurs about 1700 ft. above the sea, forming the hill of La Selle. This schist is much contorted, but seems to have a general dip to the south. The interior of the island is formed by ancient coral islands which are now submerged; the land is covered with coral reefs and lagoons.

The climate is pleasant during the cool season of the year, but oppressively hot in summer (December to April), except in the elevated plains of the interior, where the thermometer ranges from 70° to 75°. The mean temperature at Port Louis is 78°. There are two seasons, the cool and comparatively dry season, from April to November, and the hotter season, during which the temperature is now lower. The climate is a healthy one, excepting the years 1810 and 1812, when severe epidemics of malarial fever having frequently occurred, so that malaria now appears to be endemic among the non-European population. The rainfall varies greatly in different parts of the island. The rainfall on Port Louis is the lowest, and is about the same as at Funchal in the Madeira Islands; it ranges from 90° to 96°. The mean temperature for the year at Port Louis is 78°-6°. The rainfall for the whole island varies from 12 in. in March to 2-6 in. in September. The rainfall is generally distributed during the year. The rainfall at Pamplemousses, on the north-west or dry side of the island, from January to May is about 200 inches, and during the same period, 1861, it rose to 117,416 in 1861 to 99,784 in 1871. The figures for the three following census years were:—

1881. 1891. 1901.
Indians 248,993 252,920 259,086
Others 110,881 114,686 111,937
Total 359,874 370,888 371,023

Including the military and crews of ships in harbour, the total population in 1901 was 373,536. This total included 198,958 Europeans, and persons of Indian descent born in Mauritius, and 62,022 other Indians. There were 3,859 Chinese, while the remaining 108,847 included persons of European, African or mixed descent, Malagasy, Malais and Sinhalese. The Indian female population increased from 51,019 in 1861 to 115,986 in 1891. In the same period the European female population was slight, and in 1891, 115,918. The increase was almost entirely due to Indian immigration, the Indian population, 77,996 in 1851, being 192,634 in 1861. From that year the increase in the Indian population has been more gradual but steady, while the non-Indian population has decreased. From 1861 to 1851 it rose to 117,416 in 1861 to 99,784 in 1871. The figures for the three following census years were:—

1 See Geog. Journ. (June 1895), p. 597.
Railways connect all the principal places and sugar estates on the island, that known as the Midland line, 36 miles long, beginning at Port Louis crosses the island to Mahébourg, passing through Curepipe, where it is 182 ft. above the sea. There are in all over 150 miles of railway, all owned and worked by the government.

The first railway was opened in 1864. The roads are well kept and there is an extensive system of tramways for bringing produce from the sugar estates to the railway lines. Traction engines are the only motive power largely used. There is a complete telegraphic and telephonic service.

Government and Revenue.—Mauritius is a crown colony. The governor is assisted by an executive council of five official and two elected members, and a legislative council of 27 members, 8 sitting ex officio, 9 being nominated by the governor and 10 elected on a moderate franchise. Two of the elected members represent St Louis, a 7 rural districts into which the island is divided electing each one member. At least one-third of the nominated members must be persons not holding any public office. The number of registered electors in 1908 was 6156. The legislative session usually lasts from April to December. Members may speak either in French or English. The average annual revenue of the colony for the ten years 1896–1905, was £668,245, the average annual expenditure during the same period £666,606. Up to 1854 there was a surplus in hand, but since that time expenditure has on many occasions exceeded income, and the public debt is £1,305,000, mainly incurred however on reproductive works.

The island has largely retained the old French laws, the codes civil, de procédure, et de fabrication, etc. for use. A system of civil and criminal justice was established in 1831 under a chief judge and three puisne judges.

Religion and Education.—The majority of the European inhabitants belong to the Catholic faith. They numbered at the 1901 census 117,102, and the Protestants 6044. Anglicans, Roman Catholics and the Church of Scotland are assisted by state grants. The Act of 1867 incorporated the Burdett Coutts charitable trust, under the name of Mauritius Mission. The chief Romanist dignitary is styled bishop of Port Louis. The Mahomedans number over 30,000, but the majority of the Indian coolies are Hindus. 

The educational system, as brought into force in 1900, is under a director of public instruction assisted by an advisory committee, and consists of two branches (1) superior or secondary instruction, (2) primary instruction. For primary instruction there are government primary schools and schools maintained by the Roman Catholics, Protestants and other faiths, to which the government gives aid. In 1908 there were 67 government schools with 8400 scholars and 90 grant schools with 10,200 scholars, besides Hindu schools which are nearly 100. The total number of pupils was 18,772. The annual revenue of the Protestant schools was £3,850; the Mahomedan schools £1,271; and the Hindus others £21,114. Secondary and higher education is given in the Royal College and associated schools at Port Louis and Curepipe. The Mauritius government encourages education in the native language on the route between South Africa and India, and in relation to Madagascar and East Africa, while in Port Louis it possesses one of the finest harbours in the Indian Ocean. A permanent garrison of 3000 men is maintained in the island at a cost of about £180,000 per annum. To the cost of the troops Mauritius contributes £51 of its annual revenue—about £600,000.

History.—Mauritius appears to have been unknown to European nations, if not to all other peoples, until the year 1550, when it was discovered by Mascarens, a Portuguese navigator. It had then no inhabitants, and there seem to be no traces of a previous occupation by any people. The island was retained for most of the 16th century by its discoverers, but they made no settlements in it. In 1598 the Dutch took possession, and named the island "Mauritius," in honour of their statholder, Count Maurice of Nassau. It had then been previously called by the Portuguese "Ilha do Cernil," from the belief that it was the island so named by Pliny. Though the Dutch built a fort at Grand Port and introduced a number of slaves and convicts, they made no permanent settlement in Mauritius, finally abandoning the island in 1710. From 1715 to 1770, when the French government took possession, the island was held by agents of the French East India Company, by whom its name was again changed to "Île de France." The Company was fortunate in having several able men as governors of its colony, especially the celebrated Mahé de Labourdonnais (q.v.), who made sugar...
MAURY, J. S.

planting the main industry of the inhabitants.\(^1\) Under his
direction roads were made, forts built, and considerable portions
of the forest were cleared, and the present capital, Port Louis,
was founded. Labourdou
dnais also promoted the planting of
cotton and indigo, and is remembered as the most enlightened
and best of all the French governors. He also put down the
maroons or runaway slaves who had long been the pest of the
island. The colony continued to rise in value during the time
it was held by the French crown, and to one of the intendents,\(^5\)
Pierre Poivre, was due the introduction of the clove, nutmeg and
other spices. Another governor was D’Entrecasteaux, whose
name is kept in remembrance by a group of islands east of New
Guinea.

During the long war between France and England, at
the commencement of the 19th century, Mauritius was a continual
source of much mischief to English Indiamen and other merchant
vessels; and at length the British government determined upon
an expedition for its capture. This was effected in 1810; and
upon the restoration of peace in 1814 the possession of the
island was confirmed to Britain by the Treaty of Paris. By
the eighth article of capitulation it was agreed that the inhabi-
tants should retain their own laws, customs, and religion; and
thus the island is still largely French in language, habits, and
predilections; but its name has again been changed to that given
by the Dutch.

One of the most distinguished of the British
governors was Sir Robert Farquhar (1810–1823), who did much
to abolish the Malagasy slave trade and to establish friendly
relations with the rising power of the Hova sovereign of Madag-
casar. Later governors of note were Sir Henry Barkly (1853–
1871), and Sir J. Pope Hennessy (1883–1886 and 1888).

The history of the colony since its acquisition by Great Britain
has been one of social and political evolution. At first all
power was concentrated in the hands of the governor, but in
1832 a legislative council was constituted on which non-official
members served. In 1884–1885 this council was
transformed into a partly elected body. Of more importance
than the constitutional changes were the economic results which
followed the freeing of the slaves (1834–1839)—for the loss of
whose labour the planters received over £2,000,000 compensa-
tion. Cooles were introduced to supply the place of the
negroes, immigration being definitely sanctioned by the
government of India in 1842. Though under government control the
system of cooie labour led to many abuses. A royal commis-
sion investigated the matter in 1871 and since that time the
evils which were attendant on the system have been gradually
remedied. One result of the introduction of free labour has been
to reduce the descendants of the slave population to
smaller and unimportant class—Mauritians in this respect offering
a striking contrast to the British colonies in the West Indies.
The last half of the 19th century was, however, chiefly notable
in Mauritius for the number of calamities which overtook the
island. In 1854 cholera caused the death of 17,000 persons;
in 1867 over 30,000 people died of malarial fever; in 1892 a
hurricane of terrific violence caused immense destruction of
property and serious loss of life; in 1893 great part of Port Louis
was destroyed by fire. There were in addition several epidemics
of small-pox and plague, and from about 1880 onward the
continual decline in the price of sugar seriously affected the
islanders, especially the Creole population. During 1902–1905
an outbreak of surra, which caused great mortality among
draught animals, further tried the sugar planters and necessi-
tated government action. Notwithstanding all these calamities
the Mauritian indians, especially the Indo-Mauritians, have succeeded in
maintaining the position of the colony as an important sugar-
producing country.

Dependences.—Dependent upon Mauritius and forming part of
the colony are a number of small islands scattered over a large
extent of the Indian Ocean. Of these the chief is Rodrigues (q.v.),
375 m. east of Mauritius. Considerably north-east of Rodrigue
lie the Oil Islands or Chagos archipelago, of which the chief is
Diego Garcia (see CHAGOS). The Cargados-Carajos, a large islay
about 250 m. N.N.E. of Mauritius. Until 1903 the Seychelles,
Amaram, Aldabra and other islands lying north of Madagascar
were also part of the colony and were later on formed into a separate colony (see SEYCHELLES). Two
islands, Farquhar and Coettvy, though geographically within the
Seychelles area, remained dependent on Mauritius, being owned by
residents in that island. In 1906, however, Coettvy was transferred
to the Seychelles administration. The Amsterdam and St Paul, unin-
habited islands in the South Indian Ocean, included in an official
list of the dependencies of Mauritius drawn up in 1880, were in
1893 annexed by France. The total population of the dependencies of
Mauritius was estimated as 1,478.

Mauritius Almanack published yearly at Port Louis. A map of
the island in six sheets on the scale of one inch to a mile was
issued by the War Office in 1905.

MAURY, JEAN SIFFREIN (1746–1817), French cardinal
and archbishop of Paris, the son of a poor cobbler, was born on the
26th of June 1746 at Valrèes in the Comtat-Venaissin, the
district in France which belonged to the pope. His acuteness
was observed by the priests at the seminary of Avignon, where
he was educated and took orders. He tried his fortune by writing
doges of famous persons, then a favourite practice; and in 1771 his
doge on Fénelon was pronounced next best to Laharpe's by the
Academy. The real foundation of his fortunes was the success
of a panegyric on St Louis delivered before the Academy in 1772,
which caused him to be recommended for an abbacy. In 1777
he was made chancellor of the United Provinces on Saint Louis, Saint Augustine and Fénelon, his remarks on
Bosseu and his Essai sur l'éloquence de la chair, a volume which
contains much good criticism, and remains a French classic.
The book was often reprinted as Principes de l'éloquence.\(^1\) He
became a favourite preacher in Paris, and was Lent preacher at
court in 1781, when King Louis XVI. said of his sermon: "If the
abbé had only said a few words on religion he would have
discussed every possible subject." In 1781 he obtained the rich
priory of Lyons, near Pérone, and in 1785 he was elected to
the Academy, as successor of Lefranc de Pompignan. His
morals were as loose as those of his great rival Mirabeau, but
he was famed in Paris for his wit and gaiety. In 1786 he
was elected a member of the states-general by the clergy of the
bailliage of Pérone, and from the first proved to be the most able
of the clergy in opposing the Jacobins. In the three years that
he had drawn up the greater part of the cahier of the clergy of Pérone,
which contained a considerable programme of reform. It is
said that he attempted to emigrate both in July and in October
1789; but after that time he held firmly to his place, when almost
universally deserted by his friends. In the Constituent Assembly
he took an active part in every important debate, combating
with especial vigour the alienation of the property of the clergy.
His life was often in danger, but his ready wit always saved it,
and it was said that one bon mot would preserve him for a month.

---
\(^1\) Labourdournais is credited by several writers with the introduc-
tion of the sugar cane into the island. Leguat, however, mentions
it as being cultivated during the Dutch occupation.

---
\(^5\) The régime introduced in 1767 divided the administration
between governor, primarily charged with military matters, and
an intendant.
MAURY, H. F. A.—MAURY, M. F.

When he did emigrate in 1792 he found himself regarded as a martyr to the church and the king, and was at once named archbishop in partibus, and extra nuncio to the diet at Frankfort, and in 1794 cardinal. He was finally made bishop of Monte-
fiacrone, and settled down in that little Italian town—but not for long, for in 1798 the French drove him from his seat, and he sought refuge in Venice and St. Petersburg. Next year he returned to Rome as ambassador of the exiled Louis XVIII.

In 1804 he began to prepare his return to France by a well-turned letter to Napoleon, congratulating him on restoring religion to France once more. In 1806 he did return; in 1807 he was again received into the Academy; and in 1810, on the refusal of Cardinal Fesch, was made archbishop of Paris. He was presently ordered by the pope to surrender his functions as archbishop of Paris. This he refused to do. On the restora-
tion of his functions by order of the French government, he declined to leave the Academ.y and from the archiepiscopal palace. He retired to Rome, where he was imprisoned in the castle of St. Angelo for six months for his disobedience to the papal orders, and died in 1817, a year or two after his release, of disease contracted in prison and of chagrin. As a critic he was a very able writer, and Sainte-Beuve gives him the credit of discovering Father Jacques Bridyane, and of giving Bossuet his rightful place as a preacher above Massillon; as a politician, his wit and eloquence made him a worthy rival of Mirabeau. He sacrificed too much to personal ambition, yet it would have been a graceful act if Louis XVIII. had remembered the courageous supporter of Louis XVI., and the pope the one intrepid defender of the Church in the states-
general.

The œuvres critiques du Cardinal Maury (5 vols., 1827) contain what is worth preserving. Maury published Maury's Correspondance diplomatique (2 vols., Lille, 18011). For his life and character see Vie du Cardinal Maury, by Louis Siffrein Maury, his nephew (1828); J. J. F. Poujoulat, Cardinal Maury, sa vie et ses œuvres (Geneva, 1846); J. M. de Fontaine, Louis Maury, son siècle (Paris, 1846); Pépin, Le cardinal Maury (Paris, 1881); and Mérigot, L'abbé Maury (1746-1791), L'abbé Maury avant 1790, L'abbé Maury et Mirabeau (1887); G. Bonet-Maury, Le Cardinal Maury d'après ses mémoires et sa correspondance inédits (Paris, 1892); A. Aulard, Les Ouvrages de la constatation (Paris, 1892). Of the many libels written against him during the Revolution the most noteworthy are the Petit carême de l'abbé Maury, with a supplement called the Seconde année (1790), and the Vie privée de l'abbé Maury (1790), claimed by J. Irénée Hébert, but attributed by some writers to Restif de la Bretonne. For further bibliographical details see J. M. Quéfard, La France littéraire, vol. v. (1833).

MAURY, LOUIS FERDINAND ALFRED (1817-1892), French scholar, was born at Meaux on the 23rd of March 1817. In 1836, having completed his education, he entered the Bibliothèque Nationale, and afterwards the Bibliothèque de l'Institut (1834), where he devoted himself to the study of archaeology, ancient and modern languages, medicine and law. Gifted with a great capacity for work, a remarkable memory and an unbiassed and critical mind, he produced without great effort a number of learned pamphlets and books on the most varied subjects. He rendered great service to the Académie des Inscriptions et Belles Lettres, of which he was a member in 1830, Louis Napoleon III. employed him in research work connected with the Histoire de César, and he was rewarded, proportionately to his active, if modest, part in this work, with the positions of librarian of the Tuileries (1866), professor at the College de France (1862) and director-general of the Archives (1868). It was not, however, to the imperial favour that he owed these high positions. He used his influence for the advancement of science and higher education, and with Victor Duruy was one of the founders of the École des Hautes Études. He died at Paris four years after his retirement from the last post, on the 11th of February 1892.

BIBLIOGRAPHY.—His works are numerous: Les Fées au moyen âge and Histoire des légendes pieuses au moyen âge; two books filled with ingenious ideas, which were published in 1834, and reprinted after the death of the author, with numerous additions under the title Croisades et légendes du moyen âge (1896); Histoire des grandes forêts de la Gaule et de l'ancienne France (1835; a 3rd ed. revised and enlarged, 1842); La Terre et l'homme, a general historical sketch of geology, geography and ethnology, being the introduction to the Histoire universelle, by Victor Duruy (1843); Histoire des religions de la Grèce antique (3 vols., 1857-1899); La Magie et l'astrologie dans l'antiquité et au moyen âge (1863); Histoire de l'ancienne académie des sciences (1864); Histoire de l'Académie des Inscriptions et Belles Lettres (1864); a learned paper on the reports of French archaeology, written on the occasion of the universal exhibition (1867); a number of articles in the Encyclopédie moderne (1840-1851), in Michaud's Biographie universelle (1858 and seq.), in the Journal des savants (1873, 1877, 1894, 1895). A detailed bibliography of his work has been placed by Auguste Longnon at the beginning of the volume Les Croisades et légendes du moyen âge.

MAURY, MATTHEW FONTAINE (1806-1873), American naval officer and hydrographer, was born near Fredericksburg in Spottsylvania county, Virginia, on the 24th of January 1806. He was educated at Harpeth academy, and in 1825 entered the navy as midshipman, circumnavigating the globe in the "Vincennes," during a cruise of four years (1826-1830). In 1831 he was appointed master of the ship "Falmouth" on the Pacific station, and subsequently served in other vessels before returning home in 1834, when he married his cousin Ann Herndon. In 1835-1836 he was actively engaged in producing for publication a treatise on navigation, a remarkable achievement at so early a stage in his career; he was at this time made lieutenant, and gazetted astronomer to a South Sea exploring expedition, but resigned this position and was appointed to the survey of southern harbours. In 1839 he met with an accident which resulted in permanent lameness, and unfitted him for active service. In the same year, however, he began to write a series of articles on naval reform and other subjects, under the title of Scraps from the Lucky-Bag, which attracted much attention; and in 1841 he was placed in charge of the Dépôt de Charts and Instruments, out of which grew the United States Naval Observatory and the Hydrographic Office. He laboured assiduously to obtain observations as to the winds and currents by distributing to captains generally prepared books; and in the course of nine years he had collected a sufficient number of logs to make two hundred manuscript volumes, each with about two thousand five hundred days' observations. One result was to show the necessity for combined action on the part of maritime nations in regard to ocean meteorology. This led to an international conference at Brussels in 1853, which produced the greatest benefit to navigation as well as indirectly to meteorology. Maury attempted to organize co-operative meteorological work on land, but the government did not at this time take any steps in this direction. His oceanographical work, however, received recognition in all parts of the civilized world, and in 1855 it was proposed in the senate to remunerate him, but in the same year the retiring board declined in act to promote the efficiency of the navy placed on the marine list. This action aroused wide opposition, and in 1858 he was reinstated with the rank of commander as from 1855. In 1855 Maury had published his Letters on the Amazon and Atlantic Slopes of South America, and the most widely popular of his works, the Physical Geography of the Sea, was published in London in 1855, and in New York in 1856; it was translated into several European languages. On the outbreak of the American Civil War in 1861, Maury threw in his lot with the South, and became head of coast, harbour and river defences. He invented an electric torpedo for harbour defence, and in 1862 was ordered to England to purchase torpedo material, &c. Here he took active part in organizing a petition for peace to the American people, which was unsuccessful. Afterwards he became imperial commissioner of emigrants to the emperor Maximilian of Mexico, and attempted to form a Virginian colony in that country. Incidentally he introduced there the cultivation of cinchona. The scheme of colonization was abandoned by the emperor (1866), and Maury, who had lost nearly all his money during the war, settled for a while in England, where he was presented with a testimonial raised by public subscription, and among other honours received the degree of LL.D. of Cambridge University (1868). In the same year, a general amnesty admitting of his return to America, he accepted the professorship of meteorology in the Virginia Military Institution, and settled at Lexington, Virginia, where he died on the 1st of February 1875.
MAUSOLEUM—MAVROCORDATO 917

Among works published by Maury, in addition to those mentioned, are the papers contributed by him to the Astronomical Observations of the United States Observatory, Letter concerning Lanes for Steamers crossing the Atlantic (1855); Physical Geography (1864) and Manual of Geography (1871). In 1859 he began the publication of a series of Nautical Monographs.

See Diana Fontaine Maury Corbin (his daughter), Life of Matthew Fontaine Maury (London, 1888).

MAUSOLEUM, the term given to a monument erected to receive the remains of a deceased person, which may sometimes take the form of a sepulchral chapel. The term cuneoloph (Gr. κυνος, empty, ραός, tomb) is employed for a similar monument where the body is not buried in the structure. The term "mausoleum" originated with the magnificent monument erected by Queen Zenobia in Cappadocia, and by King Mausolus, of which the remains were brought to England in 1839 by Sir Charles Newton and placed in the British Museum. The tombs of Augustus and of Hadrian in Rome are perhaps the largest monuments of the kind ever erected.

MAUSOLUS (more correctly MAUSSOLUS), satrap and practically ruler of Caria (377-353 B.C.). The part he took in the revolt against Artaxerxes Mmemon, his conquest of a great part of Lycia, Ionia and of several of the Greek islands, his co-operation with the Rhodians and their allies in the war against Athens, and the removal of his capital from Mylasa, the ancient seat of the Carian kings, to Halicarnassus are the leading facts of his history. He is best known from the tomb erected for him by his widow Artemisia. The architects Satyrus and Pythis, and the sculptors Scopas, Leochares, Bryaxis and Timotheus, finished the work after her death. (See HALICARNASSUS.) An inscription discovered at Mylasa (Böckh, Inscr. gr. ii. 2691 c.) details the punishment of certain conspirators who had made an attempt upon his life in a festival in a temple of Artemis in 363 B.C. (See Diod. Sic. xvi. 96, 3, xvii. 7, 3). De Mortibus. De Rhodi-orum libertate. J. B. Bury, Hist. of Greece (1902). i. 271; W. Judeich, Kleinasienstudien (Marburg, 1892), pp. 226-236, and authorities under HALICARNASSUS.

MAUVE, ANTON (1838-1888), Dutch landscape painter, was born at Zaandam, the son of a Baptist minister. Much against the wish of his parents he took up the study of art and entered the studio of Van Os, whose dry academic manner had, however, but little attraction for him. He benefited far more by his intimacy with his friends Jozef Israels and W. Maris. For several years aged 22 he lived in England where he wielded his brush in a light and highly finished manner for a freer, looser method of painting, and the brilliant palette of his youthful work for a tender lyric harmony which is generally restricted to delicate greys, greens, and light blue. He excelled in rendering the soft, hazy atmosphere that lingers over the green meadows of Holland, and devoted himself almost exclusively to depicting the peaceful rural life of the fields and country lanes of Holland—especially of the districts near Oosterbeek and Wolvehezen, the sand dunes of the coast at Scheveningen, and the country near Laren, where he spent the last years of his life. A little sad and melancholy, his pastoral scenes are nevertheless conceived in a peaceful soothing lyrical mood, which is in marked contrast to the epic power and almost tragic intensity of J. F. Millet. There are fourteen of Mauve's pictures at the Mésdag Museum at the Hague, and two ("Walking Time" and "A Fishing Boat putting to Sea") at the Rijks Museum in Amsterdam. The Glasgow Corporation Gallery owns his painting of "A Flock of Sheep." The finest and most representative private collection of pictures by Mauve was made by Mr. J. C. J. Drucker, London.

MAVROCORDATO, MAVROCORDAT or MAVROCORDATE, the name of a family of Phanariot Greeks, distinguished in the history of Turkey, Rumania and modern Greece. The family was founded by a merchant of Chios, whose son Alexander Mavrocordato (c. 1636-1709), a doctor of philosophy and medicine of Bologna, became dragoman to the sultan in 1673, and was much employed in negotiations with Austria. It was he who drew up the treaty of Karlowitz (1699). He became a secretary of state, and was created a count of the Holy Roman Empire. His authority, with that of Hussein Kupruli and Rami Pasha, was supreme at the court of Mustapha II., and he did much to ameliorate the condition of the Christians in Turkey. He was disgraced in 1703, but was recalled to court by Sultan Ahmed III. He left some historical, grammatical, &c. treatises of little value.

His son NICHOLAS MAVROCORDATO (1679-1739) was grand dragoman to the Divan (1697), and in 1708 was appointed hospodar (prince) of Moldavia. Deposed, owing to the sultan's suspicions, in favour of Demetrius Cantacuzene, he was restored in 1711, and soon afterwards became hospodar of Walachia. In 1716 he was deposed by the Austrians, but was restored after the peace of Passarowitz. He was the first Greek set to rule the Danubian principalties, and was responsible for establishing the system which for a hundred years was to make the name of Greek hateful to the Rumanians. He introduced Greek manners, the Greek language and Greek costume, and set up a splendid court on the Byzantine model. For the rest he was a man of enlightenment, founded libraries and was himself the author of a curious work entitled Πατρικιανος (Bucharest, 1719). He was succeeded as grand dragoman (1709) by his son John (Ioannes), who was for a short while hospodar of Moldavia, and died in 1720.

Nicholas Mavrocordato was succeeded as prince of Walachia in 1729 by his son Constantine. He was deprived in the same year, but again ruled the principality from 1732 to 1741 and from 1744 to 1748; he was prince of Moldavia from 1741 to 1744 and from 1748 to 1749. His rule was distinguished by numerous tentative reforms in the fiscal and administrative systems. He was wounded and taken prisoner in the affair of Galati during the Russo-Turkish War, on the 5th of November 1760, and died in captivity.

PRINCE ALEXANDER MAVROCORDATO (1741-1865), Greek statesman, a descendant of the hospodars, was born at Constantinople on the 11th of February 1741. In 1812 he went to the court of his uncle Ioannes Caradja, hospodar of Walachia, with whom he passed into exile in Russia and Italy (1817). He was a member of the Hetairia Philike and was among the Phanariot Greeks who hastened to the Morea on the outbreak of the War of Independence in 1821. He was active in endeavouring to establish a regular government, and in January 1822 presided over the first Greek national assembly at Epidaurus. He commanded the advance of the Greeks into western Hellas the same year, and suffered a defeat at Peta on the 16th of July, but retrieved this disaster somewhat by his successful resistance to the first siege of Missolonghi (Nov. 1822 to Jan. 1823). His English sympathies brought him, in the subsequent strife of factions, into opposition to the "Russian" party headed by Demetrius Ypsilanti and Kolokotrones; and though he held the portfolio of foreign affairs for a short while under the presidency of Petroby (Petros Mavromichales), he was compelled to withdraw from affairs until February 1825, when he again became a secretary of state. The landing of Ibrahim Pasha followed, and Mavrocordato again joined the army, only escaping capture in the disaster at Sphagia (Spakteria), on the 4th of May 1825, by swimming to Navarino. After the fall of Missolonghi (April 22, 1826) he went into retirement, until President Capo d'Istria made him a member of the committee for the administration of war material, a position he resigned in 1828. After Capo d'Istria's murder (Oct. 9, 1831) and the resignation of his brother and successor, Arafino Capo d'Istria (April 13, 1832), Mavrocordato became minister of finance. He was vice-president of the National Assembly at Argos (July, 1832), and was appointed by King Otto minister of finance, and in 1833 premier. From 1834 onwards he was Greek envoy at Munich, Berlin, London and—at a short interlude as premier in Greece in 1841—Constantinople. In 1843, after the revolution of September, he returned to Athens as minister without portfolio in the Metaxas cabinet, and from April to August 1844 was head of the government formed after the fall of the "Russian" party. Going into opposition, he distinguished himself by his violent attacks on the Koletis government. In 1854-1855 he was again head of the government for a few months. He died in Aegina on the 18th of August 1865.

MAWKMAI (Burmese Maukmai), one of the largest states in the eastern division of the southern Shan States of Burma. It lies approximately between 19° 30' and 20° 30' N. and 97° 30' and 98° 15' E., and has an area of 2,787 sq. m. The central portion of the state consists of a wide plain well watered and under rice cultivation. The rest is chiefly hills in ranges running north and south. There is a good deal of teak in the state, but it has been ruinously worked. The sawbwa now works as contractor for government, which takes one-third of the net profits. Rice is the chief crop, but much tobacco of good quality is grown in the Langkô district on the Teng river. There is also a great deal of cattle-breeding. The population in 1901 was 20,454, over two-thirds of whom were Shans and the remainder Taungthu, Burmese, Yangsek and Red Karens. The capital, Mawkmai, stands in a fine rice plain in 20° 06' N. and 97° 25' E. It had about 150 houses when it first submitted in 1887, but was burnt out by the Red Karens in the following year. It has since recovered. There are very fine orange groves a few miles south of the town at Kantu-awn, called Kadugaye by the Burmese.

MAXENTIUS, MARCUS AURELIUS VALERIUS, Roman emperor from A.D. 306 to 312, was the son of Maximianus Herculeus, and the son-in-law of Galerius. Owing to his vices and incapacity he was left out of account in the division of the empire which took place in 305. A variety of causes, however, had produced such dissatisfaction at Rome with many of the arrangements established by Diocletian, and on the 28th of October 306, the public discontent found expression in the massacre of those magistrates who remained loyal to Flavius Valerius Severus and in the election of Maxentius to the imperial dignity. With the help of his father, Maxentius was enabled to put Severus to death and to repel the invasion of Galerius; his next steps were first to banish Maximianus, and then, after achieving a military success in Africa against the rebellious governor, L. Domitius Alexander, he declared war on Constantius, who having brought about the death of his father, Maximianus. His intention of carrying the war into Gaul was anticipated by Constantine, who marched into Italy. Maxentius was defeated at Saxa Rubra near Rome and drowned in the Tiber while attempting to make his way across the Milvan bridge into Rome. He was a man of brutal and worthless character; but although Gibbon’s statement that he was “just, humane and even partial towards the afflicted Christians” may be exaggerated, it is probable that he never exhibited any special hostility towards them.

See De Broglie, L’Église et l’empire Romain au quatrième sicle (1856-1866), and on the attitude of the Romans towards Christianity generally, app. 8 in vol. ii. of J. B. Bury’s edition of Gibbon (Zosimus ii. 9-18; Zonaras xii. 33, xii. 1; Aurelius Victor, Epit. 40; Eutropius, xiii. 13).

MAXIM, SIR HIRAM STEVENS (1840— ), Anglo-American engineer and inventor, was born at Sangerville, Maine, U.S.A., on the 5th of February 1840. After serving an apprenticeship with a machinist, he entered the machine works of his uncle, Levi Stevens, at Fitchburg, Massachusetts, in 1864, and four years later he became a draughtsman in the Novelty Iron Works and Shipbuilding Company in New York City. About this period he produced several inventions connected with illumination by gas; and from 1877 he was one of the numerous inventors who were trying to solve the problem of making an efficient and durable incandescent electric lamp, in this connexion introducing the widely-used process of treating the carbon filaments by heating them in an atmosphere of hydrocarbon vapour. In 1880 he came to Europe, and soon began to devote himself to the construction of a machine-gun which should be automatically loaded and fired by the energy of the recoil (see Machine-Gun). In order to realize the full usefulness of the weapon, which was first exhibited in an underground range at Hatton Garden, London, in 1884, he felt the necessity of employing a smokeless powder, and accordingly he devised maxima, a mixture of trinitrotoluene, nitroglycerine and castor oil, which was patented in 1889. He also undertook to make a flying machine, and after numerous preliminary experiments constructed an apparatus which was tried at Bexley Heath, Kent, in 1894. (See Flight.) Having been naturalized as a British subject, he was knighted in 1901. His younger brother, Hudson Maxim (b. 1853), took out numerous patents in connexion with explosives.

MAXIMA AND MINIMA, in mathematics. By the maximum or minimum value of an expression or quantity is meant primarily the “greatest” or “least” value that it can receive. In general, however, there are points at which its value ceases to increase and begins to decrease; its value at such a point is called a maximum. So there are points at which its value ceases to decrease and begins to increase; such a value is called a minimum. There may be several maxima or minima, and a minimum is not necessarily less than a maximum. For instance, the expression \((x^2 + z^2)/(x - 1)\) can take all values from \(-\infty\) to \(-1\) and from \(+7\) to \(+\infty\), but has, so long as \(x\) is real, no value between \(-1\) and \(+7\). Here \(-1\) is a maximum value, and \(+7\) is a minimum value of the expression, though it can be made greater or less than any assignable quantity.

The first general method of investigating maxima and minima seems to have been published in A.D. 1629 by Pierre Fermat. Particular cases had been discussed. Thus Euclid in book III. of the Elements find the greatest and least straight lines that can be drawn from a point to the circumference of a circle, and in the book VI. (in a proposition generally omitted from editions of his works) finds the parallelogram of greatest area with a given perimeter. Apollonius investigated the greatest and least distances of a point from the perimeter of a conic section, and discovered them to be the normals, and that their feet were the intersections of the conic with a rectangular hyperbola. Some remarkable theorems on maximum areas are attributed to Zenodorus, and preserved by Pappus and Theon of Alexandria. The most noteworthy of them are the following:—

1. Of polygons of \(n\) sides with a given perimeter the regular polygon encloses the greatest area.
2. Of two regular polygons of the same perimeter, that with the greater number of sides encloses the greater area.
3. The circle encloses a greater area than any polygon of the same perimeter.
4. The sum of the areas of two isosceles triangles on given bases, the sum of whose perimeters is given, is greatest when the triangles are similar.
5. Of segments of a circle of given perimeter, the semicircle encloses the greatest area.
6. The sphere is the surface of greatest area which encloses the greatest volume.

Serenus of Antissa investigated the somewhat trifling problem of finding the triangle of greatest area whose sides are formed by the intersections with the base and curved surface of a right circular cone of a plane drawn through its vertex.

The next problem on maxima and minima of which there appears to be any record occurs in a letter from Regiomontanus to Oder (July 4, 1472), and is a particular numerical example of the problem of finding the point on a given straight line at which two given points subtend a maximum angle. N. Tartaglia in his General trattato di numeri et mesuri (c. 1556) gives, without proof, a rule for dividing a number into two parts such that the continued product of the numbers and their difference is a maximum.

Fermat investigated maxima and minima by means of the principle that in the neighbourhood of a maximum or minimum the differences of the values of a function are insensible, a method virtually the same as that of the differential calculus, and of great use in dealing with geometrical maxima and minima. His method was developed by Huygens, Leibnitz, Newton and others, and in particular by John Hudde, who investigated maxima and minima of functions of more than one independent variable, and made some attempt to discriminate between maxima and minima, a question first definitely settled, so far as one variable is concerned, by Colin Maclaurin in his Treatise on Fluxions (1742). The method of the differential calculus was perfected by Euler and Lagrange.

John Bernoulli’s famous problem of the “brachistochrone,” or curve of quickest descent from one point to another under
the action of gravity, proposed in 1696, gave rise to a new kind of maximum and minimum problem in which we have to find a curve and not points on a given curve. From these problems arose "Calculus of Variations." (See Varia-

The only general methods of attacking problems on maxima and minima are those of the differential calculus or, in geometrical problems, what is practically Fermat's method. Some problems may be solved by algebra; thus if \( y = f(x) + \phi(x) \), where \( f(x) \) and \( \phi(x) \) are polynomials in \( x \), the limits to the values of \( y \) may be found from the consideration that the equation \( y \phi(x) - f(x) = 0 \) must have real roots. This is a useful method in the case in which \( \phi(x) \) and \( f(x) \) are quadratics, but scarcely ever in any other case. The problem of finding the maximum product of \( n \) positive quantities whose sum may be found also, algebraically, thus. If \( a \) and \( b \) are any two positive quantities whatever \( \{ (a+b)^2 \geq a b \} \), so that we can increase the product leaving the sum unaltered by replacing any two terms by half their sum, and so long as any two of the quantities are unequal we can increase the product.

Now, the quantities being all positive, the product cannot assume any value above the potential maximum, and no other form of the product than that in which they are all equal can be the maximum, so that the product is a maximum when they are all equal. Its minimum value is obviously zero. If the restriction that all the quantities shall be positive is removed, the product can be made equal to any quantity, positive or negative. So other theorems of algebra, which are stated as theorems on inequalities, may be regarded as algebraic solutions of problems on maxima and minima.

For purely geometrical questions the only general method available is practically that employed by Fermat. If a quantity depends on the position of some point \( P \) on a curve, and if its value is equal at two neighbouring points \( P \) and \( P' \), then at some position between \( P \) and \( P' \) it attains a maximum or minimum, and this position may be found by making \( P \) and \( P' \) approach each other indefinitely. Take for instance the problem of Regio-

The method of the differential calculus is theoretically very simple. Let \( u \) be a function of several variables \( x_1, x_2, x_3, \ldots, x_n \), supposed for the present independent; if \( u \) is a maximum or minimum for the set of values \( x_1, x_2, \ldots, x_n \) and \( u \) becomes \( u + \delta u \), when \( x_1, x_2, \ldots, x_n \) receive small increments \( \delta x_1, \delta x_2, \ldots, \delta x_n \); then \( \delta u \) must have the same sign for all possible values of \( x_1, x_2, \ldots, x_n \).

Now

\[ \delta u = x_1 \delta x_1 + x_2 \delta x_2 + \cdots + x_n \delta x_n \]

The sign of this expression in general is that of \( \Sigma (x_1 \delta x_1) / x_1 \), which cannot be changed when \( x_1, x_2, \ldots, x_n \) are replaced by different values of \( x_1, x_2, \ldots, x_n \) and \( u \) becomes \( u + \delta u \); when \( x_1, x_2, \ldots, x_n \) receive small increments in the 

For the case of a single variable \( x \), corresponding to a value of \( x \) given by the equation \( u = \frac{dx}{dx} = 0 \), \( u \) is a maximum or minimum as \( x \) or \( u \) is negative or positive. If \( \frac{du}{dx} = 0 \), then there is no minimum or maximum unless \( \frac{du}{dx} \) vanishes, and there is a maximum or minimum, according as the sign is negative or positive.

Generally, if the first differential coefficient which does not vanish is even, there is a minimum or maximum according as this is negative or positive. If it is odd, there is no maximum or minimum.

In the case of several variables, the quadratic

\[ \sum a_{ij} x_i x_j + \sum b_{ij} x_i = 0 \]

must be one-signed. The condition for this is that the series of discriminants

\[ (a_{ij} + a_{kl} a_{ij} a_{kl} + \cdots + a_{ij} a_{kl} a_{kl}) \]

where \( a_{ij} \) denotes \( p_{iij} x_i x_j \); should be all positive if the quadratic is always positive, and alternately negative and positive, and the quadratic is always negative. If the first condition is satisfied the maximum or minimum is a minimum, if the second it is a maximum. For the case of two variables the conditions are

\[ \frac{du}{dx} = \frac{du}{dy} = 0 \]

for a maximum or minimum at all and \( \frac{du}{dx} = \frac{du}{dy} = 0 \) both negative for a maximum, and both positive for a minimum. It is not possible to give the general condition, it is meant that it cannot be made to vanish except when \( x_k, y_k, \ldots, x_n \) all vanish. If, in the case of two variables,

\[ \frac{du}{dx} \frac{du}{dy} > 0 \]

then the quadratic is one-signed unless it vanishes, but the value of \( u \) is not necessarily maximum or minimum in either case, and the terms of the third and possibly fourth order must be taken account of.

Take for instance the function \( u = x^2 - y^2 + z^2 \).

Here the values \( x = 0, y = 0 \) satisfy the equations \( \frac{du}{dx} = 0, \frac{du}{dy} = 0 \), so that zero is a critical value of \( u \), but it neither is a maximum nor a minimum although the terms of the second order are \( (\delta y)^2 \), and are never negative. Here \( \delta u = dx^2 + dy^2 + (2z)^2 \), and by putting \( z = 0 \) or an infinitesimal of the same order as \( dy^2 \), we can make the sign of \( \delta u \) dependent on that of \( dy^2 \), and so be positive or negative as we please. On the other hand, if \( t \) is the value of the function \( x = 0, y = 0 \), we make zero a critical value of \( u \), and here \( \delta u = 2x dx^2 + 2y dy^2 \), which is always positive, because we can write it as the sum of two squares, viz. \( (dx^2 - dy^2)^2 + 4y^2 \), so that in this case zero is a minimum value of \( u \).

A critical value usually gives a maximum or minimum in the case of a function of one variable, and often in the case of several independent variables, but all maxima and minima, particularly maxima and minima, are of the first critical values, and the least and largest values of \( x \) are \( a \) and \( b \), though neither of them is a critical value.

Consider the following example: A person in a boat \( a \) miles from the nearest point of the beach wishes to reach as quickly as possible, a more miles from the point along the shore. The ratio of his rate of walking to his rate of rowing is cosec \( a \). Where should land?

Here let \( AB \) be the direction of the beach. The nearest point to \( O \), and the point he wishes to reach. Clearly he must land, if at all, between \( A \) and \( B \), unless he lands at \( P \). Let the angle \( AOB \) be \( \theta \), so that \( OP = a \) sec \( \theta \), and \( PB = b - a \) tan \( \theta \). If his rate of rowing is \( v \) miles an hour his time will be \( a \) sec \( \theta/v + b - a \) tan \( \theta/v \) the time.

To find this, \( T \) and \( b - a \) tan \( \theta/v \) have opposite signs from \( \theta = 0 \) to \( \theta = a \), and the same signs from \( \theta = a \) to \( \theta = AOB \). So that when \( AOB \) is a, \( T \) decreases from \( \theta = a \) to \( \theta = b - a \), and then increases, so that he should land at a point distant \( a \) tan \( \theta = b - a \) from \( A \), unless of course \( \theta = \phi \). When this is the case, \( T \) and \( b - a \) tan \( \theta = \phi \) have opposite signs throughout the whole range of \( \theta \), so that \( T \) decreases as \( \theta \) increases, and he should row directly to \( B \). In the first case the minimum value of \( T \) is also a critical value; in the second case it is not.

The greatest and least values of the bending moments of loaded rods are often at the extremities of the divisions of the rods and not at points given by critical values.

In the case of a function of several variables, \( x_1, x_2, \ldots, x_n \), it is not independent but connected by \( n \) functional relations \( x_1 = u_1, x_2 = u_2, \ldots, x_n = u_n \), so that we might proceed to eliminate \( x \) of the variables; but Lagrange's "Method of undetermined Multipliers" is a more elegant and generally more useful.

We have \( u_1 = 0, u_2 = 0, \ldots, u_n = 0 \). Consider instead of \( \delta u \), what is the same thing, viz. \( \delta u + \lambda_1 \delta x_1 + \lambda_2 \delta x_2 + \cdots + \lambda_n \delta x_n \), where \( \lambda_1, \lambda_2, \ldots, \lambda_n \) are arbitrary multipliers. The terms of the first order in this expression are
We can choose \( l_1, \ldots, l_m \), to make the coefficients of \( l_1, l_2, \ldots, l_m \), vanish, and the remaining \( l_m+1, \ldots, l_n \) are to be regarded as independent, so that, when \( u \) has a critical value, their coefficients must also vanish. So that we put

\[ \delta x_1 + \delta y_1 + \delta z_1 + \cdots + \delta x_m = 0 \]

for all values of \( r \). These equations with the equations \( u_1 = 0 \), \( u_2 = 0 \), \( u_3 = 0 \), etc. are exactly enough to determine \( l_1, \ldots, l_m, z_1, \ldots, z_n \), so that we find critical values of the terms of the second order to decide whether we obtain a maximum or minimum.

To take a very simple illustration: consider the problem of determining the maximum and minimum radii vectors of the ellipsoid \( x^2 + y^2 + z^2 = \frac{1}{2} \), where \( x^2+y^2+z^2 = 1 \). Here we regard the maximum and minimum values of \( x^2+y^2+\frac{1}{2}z^2 = 1 \). So we have the equations:

\[ \begin{align*}
\delta x &= 2\delta x(1 + x) + 2\delta y(1 + y) + 2\delta z(1 + z) \\
\delta y &= 2\delta x(1 + x) + 2\delta y(1 + y) + 2\delta z(1 + z) \\
\delta z &= 2\delta x(1 + x) + 2\delta y(1 + y) + 2\delta z(1 + z)
\end{align*} \]

To make the terms of the first order disappear, we have the three equations:

\[ \begin{align*}
x(1 + x) &= 0, \quad y(1 + y) = z(1 + z) = 0.
\end{align*} \]

These have three sets of solutions consistent with the conditions \( x^2+y^2+z^2 = \frac{1}{2} \), \( x^2+y^2+z^2 = 1 \), which is always negative, so that \( u = 0 \) is a minimum.

In the case of \( x^2+y^2+z^2 = \frac{1}{2} \), this is always positive, and we have a maximum.

In the case of \( x^2+y^2+z^2 = 1 \), which is always positive, we have a minimum.

So that \( u = 0 \), though a critical value, is neither a maximum nor minimum, and the central planes of circular section. Where we have the equations:

\[ \begin{align*}
x^2 + y^2 + z^2 &= \frac{1}{2} \\
x^2 + y^2 + z^2 &= 1
\end{align*} \]

We have the solutions of the equations of the term of the first order, we have the three equations:

\[ \begin{align*}
x(1 + x) &= 0, \quad y(1 + y) = z(1 + z) = 0.
\end{align*} \]

These have three sets of solutions consistent with the conditions \( x^2+y^2+z^2 = \frac{1}{2} \), \( x^2+y^2+z^2 = 1 \), which is always negative, so that \( u = 0 \) is a minimum.

In the case of \( x^2+y^2+z^2 = \frac{1}{2} \), this is always positive, and we have a maximum. In the case of \( x^2+y^2+z^2 = 1 \), which is always positive, we have a minimum.

Maximilianus, a Latin epic poet who flourished during the 6th century A.D. He was an Etruscan by birth, and spent his youth at Rome, where he enjoyed a great reputation as an orator. At an advanced age he was sent on an important mission to the East, perhaps by Theodoric, if he is the Maximilianus to whom that monarch addressed a letter preserved in Cassiodorus (variorum, i. 21). The six elegies extant under his name, written in old age, in which he laments the loss of his youth, contain descriptions of various amours. They show the author's familiarity with the best writers of the Augustan age.

Editions by J. C. Wernsdorf, Postae latini minores, vi.; E. Bährns, Postae latini minor (1801); E. Petri (1830); in C. F.アクセスioner's Berliner Studien, xi.; R. Webster (Princeton, 1901; see Critical Review, Oct. 1901), with introduction and commentary; see also Robinson Eills in American Journal of Philology, v. (1884) and Teuffe-Schwanke, Histoire of Roman Literature (Eng. trans.), § 200. There is an English version (as from Cornelius Gallus), by Hovenden Walker (1689), under the title of The Impotent Lover.

Maximilianus, Marcus Aurelius Valerius, surnamed Hercules, Roman emperor from A.D. 286 to 305, was born of humble parents at Sirmium in Pannonia. He achieved distinction during long service in the army, and having been made Caesar by Diocletian in 283, received the title of Augustus in the following year (April 1, 286). In 287 he suppressed the rising of the peasants (Bagaudae) in Gaul, but in 289, after a three years' struggle, his colleague and he were compelled to acquiesce in the assumption by his lieutenant Carausius (who had crossed over to Britain) of the title of Augustus. After 293 Maximianus left the care of the Rhine frontier to Constantius Chlorus, who had been made Caesar by Diocletian in 293, and the next year he was induced by his son Maxentius to reassume the purple. In 307 he brought the emperor Flavius Valerius Severus a captive to Rome, and also compelled Galerius to retreat, but in 308 he was himself driven by Maximianus from Italy into Illyricum, whence again he was compelled to seek refuge at Arelate (Arles), the court of his son-in-law, Constantine. Here a false report was received, or invented, of the death of Constantine, at that time absent on the Rhine. Maximianus at once grasped at the succession, but was soon driven to Massilia (Marseilles), where, having been delivered up to his pursuers, he strangled himself.

See Zosimus ii. 7-11; Zonaras xii. 31-33; Eutropius ix. 20, x. 2, 3; Aurelius Victor p. 39. For the emperor Galerius Valerius Maximianus see GALERIUS.

**MAXIMILIAN I.** (1573-1641), called "the Great," elector and duke of Bavaria, eldest son of William V. of Bavaria, was born at Munich on the 17th of April 1573. He was educated by the Jesuits at the university of Ingolstadt, and began to take part in the government in 1591. He married in 1595 his cousin, Elizabeth, daughter of Charles II., Duke of Lorraine, and became duke of Bavaria upon his father's abdication in 1597. He refrained from any interference in German politics until 1607, when he was entrusted with the duty of executing the imperial ban against the free city of Donauwörth, a Protestant stronghold. In December 1607 his troops occupied the city, and vigorous steps were taken to restore the supremacy of the older faith. Some Protestant princes, alarmed at this action, formed a union to defend their interests, which was answered in 1609 by the establishment of a league, in the formation of which Maximilian took an important part. Under his leadership an army was set on foot, but his policy was strictly defensive and he refused to allow the league to become a tool in the hands of the house of Halsburg. Dissensions among his colleagues led the duke to resign his office in 1616, but the approach of trouble brought about his return to the league about two years later.

Having refused to become a candidate for the imperial throne in 1619, Maximilian was faced with the complications arising from the outbreak of war in Bohemia. After some delay he made a treaty with the emperor Ferdinand II. in October 1619, and in return for large concessions placed the forces of the league at the emperor's service. Anxious to curtail the area of the struggle, he made a treaty of neutrality with the Protestant Union, and occupied Upper Austria as security for the expenses of the campaign. On the 8th of November 1620 his troops under Count Tilly defeated the forces of Frederick, king of Bohemia and count palatine of the Rhine, at the White Hill near Prague. In spite of the arrangement with the union Tilly then devastated the Rhenish Palatinate, and in February 1623 Maximilian was murdered in suspicious circumstances, and the attendant office of imperial steward, which had been restored to him in 1618, was abolished by the counts palatine of the Rhine. After receiving the Upper Palatinate and restoring Upper Austria to Ferdinand, Maximilian became leader of the party which sought to bring about Wallenstein's dismissal from the imperial service. At the diet of Regensburg in 1639 Ferdinand was compelled to assent to this demand, but the sequel was disastrous both for Bavaria and its ruler. Early in 1632 the Swedes marched into the duchy and occupied Munich, and Maximilian could only obtain the assistance of the imperialists by placing himself under the orders of Wallenstein, now restored to the command of the emperor's forces. The ravages of the Swedes and their French allies induced the elector to enter into negotiations for peace with Gustavus Adolphus and Cardinal Richelieu. He also promised to disarm the Protestants by modifying the Restitution edict of 1629; but these efforts were fruitless. In March 1637 he concluded an armistice with France and Sweden at Ulm, but the entreaties of the emperor Ferdinand III. led him to disregard his undertaking. Bavaria was again ravaged, and the elector's forces defeated in May 1648 at Zusmarshausen. But the peace of Westphalia soon put an end to the struggle. By this treaty it was agreed that Maximilian should retain the electoral dignity, which was made hereditary in his family; and the Upper Palatinate was incorporated with Bavaria. The elector died at Ingolstadt on the 27th of September 1651. By his second wife,
MAXIMILIAN I., II. OF BAVARIA

Maria Anne, daughter of the emperor Ferdinand II., he left two sons, Ferdinand Maria, who succeeded him, and Maximilian Philip. In 1839 a statue was erected to his memory at Munich by Louis I., king of Bavaria. Weak in health and feeble in frame, Maximilian had high ambitions both for himself and his duchy, and was tenacious and resourceful in prosecuting his designs. As the ablest prince of his age he sought to prevent Germany from becoming the battleground of Europe, and although a rigid adherent of the Catholic faith, was not always subservient to the priest.

MAXIMILIAN I. (MAXIMILIAN JOSEPH) (1756-1825), king of Bavaria, was the son of the count palatine Frederick of Zweibrücken-Birkenfeld, and was born on the 27th of May 1756. He was carefully educated under the supervision of his uncle, Duke Christian IV. of Zweibrücken, took service in 1777 as a colonel in his army, and rose rapidly to the rank of major-general. From 1782 to 1789 he was stationed at Strasbourg, but at the outbreak of the revolution he exchanged the French for the Austrian service, taking part in the opening campaigns of the revolutionary wars. On the 1st of April 1793 he succeeded his brother, Charles II., as duke of Zweibrücken, and on the 16th of February 1799 became elector of Bavaria on the extinction of the Sulzbach line with the death of the elector Charles Theodore.

The sympathy with France and with French ideas of enlightenment which characterized his reign was at once manifested. In the newly organized ministry Count Max Josef von Montgelas (q.v.), who, after falling into disfavour with Charles Theodore, had acted for a time as Maximilian Joseph's private secretary, was the most potent influence, an influence wholly "enlightened" and French. Agriculture and commerce were fostered, the laws were ameliorated, a new criminal code drawn up, taxes and imposts equalized without regard to traditional privileges, while a number of religious houses were suppressed and their revenues used for educational and other useful purposes. In foreign politics Maximilian Joseph's interest was always from the German point of view less commendable. With the growing feeling of German nationality he had from the first to last no sympathy, and his attitude throughout was dictated by wholly dynastic, or at least Bavarian, considerations. Until 1813 he was the most faithful of Napoleon's German allies, the relation being cemented by the marriage of his daughter to Eugène Beauharnais. His reward came with the treaty of Pressburg (Dec. 26, 1805), by the terms of which he was to receive the royal title and important territorial acquisitions in Swabia and Franconia to round off his kingdom. The style of king he actually assumed on the 1st of January 1806.

The new king of Bavaria was the most important of the princes belonging to the Confederation of the Rhine, and remained Napoleon's ally until the eve of the battle of Leipzig, when by the convention of Ried (Oct. 8, 1813) he made the guarantee of the integrity of his kingdom the price of his joining the Allies. By the first treaty of Paris (June 3, 1814), however, he ceded Tirol to Austria in exchange for the former duchy of Würzburg. At the congress of Vienna, too, which he attended in person, Maximilian had to make further concessions to Austria, ceding the quarters of the Inn and Hausruck in return for a part of the old Palatinate. The king fought hard to maintain the contiguity of the Bavarian territories as guaranteed at Ried; but the most he could obtain was an assurance from Metternich in the matter of the Baden succession, in which he was also doomed to be disappointed (see BADEN: History, ii. 506).

At Vienna and afterwards Maximilian stoutly opposed any reconstitution of Germany which should endanger the indepen-

dence of Bavaria, and it was his insistence on the principle of full sovereignty being left to the German reigning princes that largely contributed to the loose and weak organization of the new German Confederation. The Federal Act of the Vienna congress was practically made a law by the pressure of Austria, as a result of the manoeuvres of the coalition, and it was partly to secure popular support in his resistance to any interference of the federal diet in the internal affairs of Bavaria, partly to give unity to his somewhat heterogeneous territories, that Maximilian on the 26th of May 1818 granted a liberal constitution to his people. Montgelas, who had opposed this concession, had fallen in the previous year, and Maximilian had also reversed his ecclesiastical policy, signing on the 24th of October 1817 a concordat with Rome by which the powers of the clergy, largely curtailed under Montgelas's administration, were restored. The new parliament proved so intractable that in 1819 Maximilian was driven to appeal to the powers against his own creation; but his Bavarian "particularism" and his genuine popular sympathies prevented him from allowing the Carlsbad decrees to be strictly enforced within his dominions. The suspects arrested by order of the Mainz Commission he was accustomed to examine himself, with the result that in many cases the whole proceedings were quashed, and in not a few the accused dismissed with a present of money. Maximilian died on the 15th of October 1825 and was succeeded by his son Louis I.

In private life Maximilian was kindly and simple. He loved to play the part of Landesvater, walking about the streets of his capital en bourgeois and entering into conversation with all ranks of his subjects, by whom he was regarded with great affection. He was twice married: (1) in 1785 to Princess Wilhelmine Auguste of Hesse-Darmstadt, (2) in 1797 to Princess Caroline Friedericke of Baden.

MAXIMILIAN II. (1811-1864), king of Bavaria, son of king Louis I. and of his consort Theresa of Saxe-Hildburghausen, was born on the 28th of November 1811. After studying at Göttingen and Berlin and travelling in Germany, Italy and Greece, he was introduced by his father into the council of state (1836). From the first he showed a studious disposition, declaring on one occasion that had he not been born in a royal cradle his choice would have been to become a professor. As crown prince, in the following year, he opened the Hoftheater in Füssen, which he had rebuilt with excellent taste, and his interest in the stimulate society of artists and men of learning, and devoted his time to scientific and historical study. When the abdication of Louis I. (March 28, 1848) called him suddenly to the throne, his choice of ministers promised a liberal régime. The progress of the revolution, however, gave him pause. He strenuously opposed the unionist plans of the Frankfort parliament, refused to recognize the imperial constitution devised by it, and assisted Austria in restoring the federal diet and in carrying out the federal execution in Hesse and Holstein. Although, however, from 1850 onwards his government tended in the direction of absolutism, he refused to become the tool of the clerical reaction, and even incurred the bitter criticism of the Ultramontanes by inviting a number of celebrated men of learning and science (e.g. Liebig and Sybel) to Munich, regardless of their religious views. Finally, in 1859, he dismissed the reactionary ministry of von der Pfördten, and met the wishes of his people for a moderate constitutional government. In his German policy he was guided by the desire to maintain the union of the princes, and hoped to attain this as against the perilous rivalry of Austria and Prussia by the creation of a league of the German princes. In 1864, to meet the so-called Trias. In 1863, however, seeing what he thought to be a better way, he supported the project of reform proposed by Austria at the Fürstenstag of Frankfurt. The failure of this proposal, and the attitude of Austria towards the Confederation in the Schleswig-Holstein question, undecided him; but
before he could deal with the new situation created by the outbreak of the war with Denmark he died suddenly at Munich, on the 10th of March 1564.

Maximilian was a man of amiable qualities and of intellectual attainments far above the average, but as a king he was hampered by constant ill-health, which compelled him to be often abroad, and when at home to live much in the country. By his wife, Maria Hedwig, daughter of Prince William of Prussia, whom he married in 1542, he had two sons, Louis II., king of Bavaria, and Otto, king of Bavaria, both of whom lost their reason.

See J. M. Söllt, Max der Zweite, König von Bayern (Munich, 1865); biography by G. K. Heigel in Allgem. Deutsche Biographie, vol. xxi. (Leipzig, 1885). Maximilian's correspondence with Schlegel was published at Stuttgart in 1890.

MAXIMILIAN I. (1459-1510), Roman emperor, son of the emperor Frederick III. and Leonora, daughter of Edward, king of Portugal, was born at Vienna Neustadt on the 22nd of March 1459. On the 18th of August 1477, by a marriage at Ghent to Mary, who had just inherited Burgundy and the Netherlands from her father Charles the Bold, duke of Burgundy, he effected a union of great importance in the history of the house of Habsburg. He at once undertook the defence of his wife's dominions from an attack by Louis XI., king of France, and defeated the French forces at Guinegatte, the modern Enguinagette, on the 7th of August 1479. But Maximilian was regarded with suspicion by the states of Netherlands, and after suppressing a rising in Gelderland his position was further weakened by the death of his wife on the 27th of March 1482. He claimed to be recognized as guardian of his young son Philip and as regent of the Netherlands, but some of the states refused to agree to his demands and disorder was general. Maximilian was compelled to assent to the treaty of Arras in 1482 between the states of the Netherlands and Louis XI. This treaty provided that Maria's eldest daughter Marguerite, and Maximilian's marriage Charles, the dauphin of France, and have for her dowry Artois and Franche-Comté, two of the provinces in dispute, while the claim of Louis on the duchy of Burgundy was tacitly admitted. Maximilian did not, however, abandon the struggle in the Netherlands. Having crushed a rebellion at Utrecht, he compelled the burghers of Ghent to restore Philip to him in 1485, and returning to Germany was chosen king of the Romans, or German king, at Frankfurt on the 16th of February 1486, and crowned at Aix-la-Chapelle on the 9th of the following April. Again in the Netherlands, he made a treaty with Francis II., duke of Brittany, whose independence was threatened by the French regent, Anne of Beaujeu, and the struggle with France was soon renewed. This war was very unpopular with the trading cities of the Netherlands, and early in 1488 Maximilian, having entered Bruges, was detained there as a prisoner for nearly three months, and only set at liberty on the approach of his father with a large force. On his release he signed the treaty of Arras and withdrew from the Netherlands; but he delayed his departure for nearly a year and took part in a punitive campaign against his captors and their allies. On his return to Germany he made peace with France at Frankfurt in July 1489, and in October several of the states of the Netherlands recognized him as their ruler and as guardian of his son. In March 1490 the county of Tirol was added to his possessions through the abdication of his kinsman, Count Sigismund, and this district soon became his favourite residence.

Meanwhile the king had formed an alliance with Henry VII., king of England, and Ferdinand II., king of Aragon, to defend the possessions of the duchess Anne, daughter and successor of Francis, duke of Brittany. Early in 1490 he took a further step and betrothed to the duchess, and later in the same year the marriage was celebrated by proxy; but Brittany was still popular, and Maximilian was unable to go to the assistance of his bride. The sequel was startling. In December 1491 Anne was married to Charles VIII., king of France, and Maximilian's daughter Marguerite, who had resided in France since her betrothal, was sent back to her father. The inaction of Maximilian at this time is explained by the condition of affairs in Hungary, where the death of king Matthias Corvinus had brought about a struggle for this throne. The Roman king, who was an unsuccessful candidate, took up arms, drove the Hungarians from Austria, and regained Vienna, which had been in the possession of Matthias since 1485, but he was compelled by want of money to retreat, and on the 7th of November 1491 signed the treaty of Pressburg with Ladislaus, king of Bohemia, who had obtained the Hungarian throne. By this treaty it was agreed that Maximilian should succeed to the crown in case Ladislaus left no legitimate male issue. Having defeated the invading Turks at Villach in 1492, the king was eager to take revenge upon the king of France; but his appeal to all Christian sovereigns was ineffectual. In 1494 he was again in the Netherlands, where he led an expedition against the rebels of Gelderland, assisted Perkin Warbeck to make a descent upon England, and formally handed over the government of the Low Countries to Philip. His attention was next turned to Italy, and, alarmed at the progress of Charles VIII. in the peninsula, he signed the league of Venice in March 1495, and about the same time arranged a marriage between his son Philip and Joanna, daughter of Ferdinand and Isabella, king and queen of Castile and Aragon. The need for help to prosecute the war in Italy and the desire to weaken France led the king in March 1495, when he urged the necessity of checking the progress of Charles. As during his father's lifetime Maximilian had favoured the reforming party among the princes, proposals for the better government of the empire were brought forward at Worms as a necessary preliminary to financial and military support. Some reforms were adopted, the public peace was proclaimed without any limitation of time and a general tax was levied. The three succeeding years were mainly occupied with quarrels with the diet, with two invasions of France, and a war in Gelderland against Charles, count of Egmont, who claimed that duchy, and was supported by French troops. The reforms of 1495 were rendered abortive by the refusal of Maximilian to attend the diets or to take any part in the working of the new constitution and in 1497 he strengthened his own authority by establishing an Aulic Council (Reichskollegium), which he declared was competent to deal with all business of the empire, and about the same time set up a court to centralize the financial administration of Germany.

In February 1499 the king became involved in a war with the Swiss, who had refused to pay the imperial taxes or to furnish a contribution for the Italian expedition. Aided by France they defeated the German troops, and the peace of Basel in September 1499 recognized them as virtually independent of the empire. About this time Maximilian's ally, Ludovico of Milan, was taken prisoner by Louis XII., king of France, and Maximilian was again compelled to ask the diet for help. An elaborate scheme for raising an army was agreed to, and in return a council of regency (Reichsrat) was established, which amounted, in the words of a Venetian envoy, to a deposition of the king. The relations were now very strained between the reforming princes and Maximilian, who, unable to raise an army, refused to attend the meetings of the council at Nuremberg, while both parties debated Worms peace with France. The hostility of the king rendered the council impotent. He was successful in winning the support of many of the younger princes, and in establishing a new court of justice, the members of which were named by himself. The negotiations with France ended in the treaty of Blois, signed in September 1504, when
Maximilian II. (1527–1576), Roman emperor, was the eldest son of the emperor Ferdinand I. by his wife Anne, daughter of Ladišlaus, king of Hungary and Bohemia, and was born in Vienna on the 31st of July 1527. Educated principally in Spain, he gained some experience of warfare during the campaign of Charles V. against France in 1544, and also during the war of the league of Schmalkalden, and soon began to take part in imperial business. Having in September 1548 married his

The university of Vienna and encouraged the development of the universities of Ingolstadt and Freiburg. He was the friend and patron of scholars, caused manuscripts to be copied and medieval poems to be collected. He was the author of military reforms, which included the establishment of the Lands-knöchte, the improvement of artillery by making cannon portable, and some changes in the equipment of the cavalry. He was continually devising plans for the better government of Austria, which he endeavored to realize by the union of the Austrian dominions. Maximilian has been called the second founder of the house of Habsburg, and certainly by bringing about marriages between Charles and Joanna and between his grandson Ferdinando and Anna, daughter of Ladišlaus, king of Hungary and Bohemia, he paved the way for the vast empire of Charles V. and for the influence of the Habsburgs in eastern Europe. But he had many qualities less desirable. He was reckless and unstable, resorting often to lying and deceit, and never pausing to count the cost of an enterprise or of an action, much less of its means. For absurd and impracticable schemes in Italy and elsewhere he neglected Germany, and sought to involve its princes in wars undertaken solely for private aggrandizement or personal jealousy. By exercising responsibilities as ruler of Germany, he only considered the question of its government when in need of money and support from the princes. As the “last of the knights” he could not see that the old order of society was passing away and a new order replacing it. He thought the, Law of Feudal Succession, and spent the better part of his life in vague schemes for its revival. As “a gifted amateur in politics” he increased the disorder of Germany and Italy and exposed himself and the empire to the plagues of Europe. Maximilian was also a writer of books, and his writings display his inordinate vanity. His Geheimes Jagdbuch, containing about 2500 words, is a treatise purporting to teach his grandsons the art of hunting. His most famous work is the Adventures of the Famous Hero and Knight Sir Teuterdank, an allegorical poem describing his adventures on his journey to marry Mary of Burgundy. The emperor’s share in the work is not clear, but it is certain that the whole scheme of events and incidents are due to him. It was first published at Nuremberg by Melchior Pfingst in 1517, and was adorned with woodcuts by Hans Leonhard Schufelein. The Weiszung was long regarded as the work of Maximilian, and a secretarial work by a Maximilian Friesdol was believed that the greater part of the book at least is the work of the emperor himself. It is an unfinished autobiography containing an account of the achievements of Maximilian, who is called “the young white king.” It was first published at Vienna in 1775. He also is remembered for Freydal, an allegorical account of events in which he took part during his wooing of Mary of Burgundy: Ehrenforten, Triumphwagen and Der weisen könige Stammbaum, books concerning his own history and that of the house of Habsburg, with various editions of Freydals von der Familie den Teuterdank und die Gärten. These works are all profusely illustrated, some by Albrecht Dürer, and in the preparation of the woodcuts Maximilian himself took the liveliest interest. A facsimile of the whole of the editions of Freydals von der Familie in various autograph works has been published in nine volumes in the Jahrbücher der kunsthistorischen Sammlungen des Kaiserhauses (Vienna, 1886–1888). For this edition S. Laschitzer wrote an introduction, Sir A. D. Teuerdank (London, 1890), and N. A. von Schult to Der Weiszung. The Holbein society issued a facsimile of Sir Teuterdank (London, 1884) and Triumphwagen (London, 1883).

cousin Maria, daughter of Charles V., he acted as the emperor's representative in Spain from 1548 to 1550, returning to Germany in December 1550 in order to take part in the discussion over the succession. Charles V. wished his son Philip (afterwards king of Spain) to succeed him as emperor, but his brother Ferdinand, who had already been designated as the next occupant of the imperial throne, and Maximilian objected to this proposal. At length a compromise was reached, Philip was to succeed Ferdinand, but during the former's reign Maximilian, as king of the Romans, was to govern Germany. This arrangement was not carried out, and is only important because the insistence of the emperor seriously disturbed the harmonious relations which had hitherto existed between the two branches of the Habsburg family; and the estrangement went so far that an illness which befell Maximilian in 1552 was attributed to poison given to him in the interests of his cousin and brother-in-law, Philip of Spain. About this time he took up his residence in Vienna, and was engaged mainly in the government of the Austrian dominions and in defending them against the Turks. The religious views of the king of Bohemia, as Maximilian had been called since his recognition as the future ruler of that country in 1540, had always been somewhat uncertain, and he had already learned something of Lutheranism in his youth; but his amicable relations with several Protestant princes, which began about the time of the discussion over the succession, were probably due more to political than to religious considerations. However, in Vienna he became very intimate with Sebastian Pfauser (1520-1569), a court preacher with strong leanings towards Lutheranism, and his religious attitude caused some uneasiness to his father. Fears were freely expressed that he would definitely leave the Catholic Church, and when Ferdinand became emperor in 1558 he was prepared to assure Pope Paul IV. that his son should not succeed him if he took this step. Eventually Maximilian remained nominally an adherent of the old faith, although his views were tinged with Lutheranism until the end of his life. After several returns to Vienna he fled to the banishment of Pfauser, and began again to attend the services of the Catholic Church. This uneasiness having been dispelled, in November 1562 Maximilian was chosen king of the Romans, or German king, at Frankfort, where he was crowned a few days later, after assuring the Catholic electors of his fidelity to their faith, and promising the Protestant electors that he would publicly accept the confession of Augsburg when he became emperor. He also took the usual oath to protect the Church, and his election was afterwards confirmed by the papacy. In September 1563 he was crowned king of Hungary, and on his father's death, in July 1564, succeeded to the empire and to the kingdoms of Hungary and Bohemia.

The new emperor had already shown that he believed in the necessity for a thorough reform of the Church. He was unable, however, to obtain the consent of Pope Pius V. to the marriage of the clergy, and in 1568 he confessed of nineteen churches that the king wanted to close. On his part Maximilian granted religious liberty to the Lutheran nobles and knights in Austria, and refused to allow the publication of the decrees of the council of Trent. Amid general expectations on the part of the Protestants he met his first Diet at Augsburg in March 1566. He refused to accede to the demands of the Lutheran princes; on the other hand, although the increase of sectarianism was discussed, no decisive steps were taken to suppress it, and the only result of the meeting was a grant of assistance for the Turkish War, which had just been renewed. Collecting a large and splendid army Maximilian marched to defend his territories; but no decisive engagement had taken place when a truce was made in 1568, and the emperor continued to pay tribute to the sultan for Hungary. Meanwhile the relations between Maximilian and Philip of Spain had improved; and the emperor's increasingly cautious and moderate attitude in religious matters was doubtless due to the fact that the death of Philip's son, Don Carlos, had opened the way for the succession of Maximilian, or of one of his sons, to the Spanish throne. Evidence of this friendly feeling was given in 1570, when the emperor's daughter, Anne, became the fourth wife of Philip; but Maximilian was unable to moderate the harsh proceedings of the Spanish king against the revolting inhabitants of the Netherland. In 1570 the emperor met the diet at Spires and asked for aid to place his eastern borders in a state of defence, and also for power to repress the disorder caused by troops in the service of foreign powers passing through Germany. He proposed that his consent should be necessary before any soldiers for foreign service were recruited in the empire; but the estates were unwilling to strengthen the imperial authority, the Protestant princes regarded the suggestion as an attempt to prevent them from assisting their coreligionists in France and the Netherlands, and nothing was done in this direction, although some assistance was voted for the defence of Austria. The religious demands of the Protestants were still unsatisfied, while the policy of toleration had failed to give peace to Austria. Maximilian's power was very limited; it was inability rather than unwillingness that prevented him from yielding to the entreaties of Pope Pius V. to join in an attack on the Turks both before and after the victory of Lepanto in 1571; and he remained inert while the authority of the empire in north-eastern Europe was threatened. His last important act was to make a bid for the throne of Poland, either for himself or for his son Ernest. In December 1575 he was elected by a powerful faction, but the diet which met at Regensburg was loath to assist; and on the 12th of October 1576 the emperor died, refusing on his deathbed to receive the last sacraments of the Church.

By his wife Maria he had a family of nine sons and six daughters. He was succeeded by his eldest surviving son, Rudolph, who had been chosen king of the Romans in October 1575. Another of his sons, Matthias, also became emperor; three others, Ernest, Albert, and Maximilian, took some part in the government of the Habsburg territories or of the Netherlands, and a daughter, Elizabeth, married Charles IX. of France.

The religious attitude of Maximilian has given rise to much discussion among historians. Some, especially W. Goetz and E. Reimann in the Historische Zeitschrift, Bande VII., XV.,XXXII. and LXXVII. (München, 1870) should be consulted, and also O. H. Holfst, Maximilian II. und der Kompromisskatholizismus (München, 1896); C. Haupt, Melanchthon und sein Lehrer Einfluss auf Maximilian II. (Wittenberg, 1897); F. Walter, Die Wahl Maximilians II. (Heidelberg, 1892); W. Goetz, Maximilians II. Wahl zum römischen Kaiser (Würtzburg, 1911), and Die Wahl Maximilians II. zu seiner Wahl zum römischen Kaiser (Würzburg, 1903). For a more general account of his life and work see Briefe und Akten zur Geschichte Maximilians II., edited by W. E. Schwarz (Paderborn, 1897); K. Koch, Geschichte Maximilians II. in Archiven gesammelt (Leipzig, 1857-1861); R. Holzmann, Kaiser Maximilian II. bis zu seiner Thronbesteigung (Berlin, 1903); E. Wertheimer, Zur Geschichte der Türkeneinwanderung Maximilians II. (Vienna, 1875); and from Rankes Die Zeiten Ferdinand's I. und Maximilians II. in Band VII., of his Sammlungen Werke (Leipzig, 1874), and J. Jansen, Geschichte des deutschen Volkes seit dem Auszug des Militales, Bande I., zu VII. (Frankfurt, 1887-1884). A translation by M. A. Mitchell and A. M. Christie (London, 1896) is available.

MAXIMILIAN (1842-1867), emperor of Mexico, second son of the archduke Francis Charles of Austria, was born in the palace of Schönbrunn, on the 6th of July 1832. He was a particularly clever boy, showed considerable taste for the arts, and early displayed an interest in science, especially botany. He was trained for the navy, and threw himself into this career with so much zeal that he quickly rose to high command, and was mainly instrumental in creating the naval port of Trieste and the fleet with which Tegethoff won his victories in the Italian War. He had some reputation as a Liberal, and this led, in February 1857, to his appointment as viceroy of the Lombardo-Venetian kingdom; in the same year he married the Princess Charlotte, daughter of Leopold I., king of the Belgians. On the outbreak of the war of 1859 he retired into private life, chiefly at Trieste, near which he built the beautiful chateau of Miramar. In this same year he was first approached by Mexican exiles with the proposal to become the candidate
MAXIMINUS—MAXIMS, LEGAL

925

for the throne of Mexico. He did not at first accept, but sought to satisfy his restless desire for adventure by a botanical expedition to the tropical forests of Brazil. In 1863, however, under pressure from Napoleon III, and after General Forey’s capture of the city of Mexico and the plebiscite which confirmed his proclamation of the empire, he consented to accept the crown. This decision was contrary to the advice of his brother, the emperor Francis Joseph, and involved the loss of all his rights in Austria. Maximilian landed at Vera Cruz on the 28th of May 1863; but from the very outset he found himself involved in difficulties of the most serious kind, which in 1866 made it apparent to almost every one outside of Mexico the necessity for his abdicating. Though urged to this course by Napoleon himself, whose withdrawal from Mexico was the final blow to his cause, Maximilian refused to desert his followers. Withdrawing, in February 1867, to Querétaro, he there sustained a siege for several weeks, but on the 15th of May resolved to attempt an escape through the enemy’s lines. He was, however, arrested before he could carry out this resolution, and after trial by court-martial was condemned to death. The sentence was carried out on the 19th of June 1867. His remains were conveyed back to Europe, and are now interred in the imperial vault early in the following year. (See MAXIM.)

Maximilian’s papers were published at Leipzig in 1867, in seven volumes, under the title Aus meinem Leben, Reiseskizzen, Aphorismen, Gedichte. See Pierre de la Gorce, Hist. du Second Empire, IV., liv. xxv. ii. (Paris, 1904); article by von Hoffinger in Allgemeine Deutschnachrichten, 1867, where the correspondence is printed.

MAXIMINUS, GAUSIUS JULIUS VERUS. Roman emperor from A.D. 235 to 238, was born in a village on the confines of Thrace. He was of barbarian parentage and was brought up as a shepherd. His immense stature and enormous feats of strength attracted the attention of the emperor Septimius Severus. He entered the army, and under Caracalla rose to the rank of centurion. He carefully abstained himself from court during the reign of Heliogabalus, but under his successor Alexander Severus, was appointed supreme commander of the Roman armies. After the murder of Alexander in Gaul, hastened, it is said, by his instigation, Maximinus was proclaimed emperor by the soldiers on the 19th of March 235. The three years of his reign, which were spent wholly in the camp, were marked by great cruelty and oppression; the widespread discontent thus produced culminated in a revolt in Africa and the assumption of the purple by Gordian (q.v.).

Maximinus, who was in Panorma at the time, marched against Rome, and passing over the Julian Alps descended on Aquileia; of which he took possession before that city he and his son were murdered in their tent by a body of anarchy. Their heads were cut off and despatched to Rome, where they were burnt on the Campus Martius by the exultant crowd.

Capitolinus, Maximiini duo; Herodian vi. 8, viii. 1-5; Zosimus i. 13-15.

MAXIMINUS [MAXIMIN]. GALERIUS VALERIUS. Roman emperor from A.D. 308 to 314, was originally an Illyrian shepherd named Daia. He rose to high distinction after he had joined the army, and in 305 he was raised by his uncle, Galerius, to the rank of Caesar, with the government of Syria and Egypt. In 308, after the elevation of Licinius, he insisted on receiving the title of Augustus; on the death of Galerius, in 311, he succeeded to the supreme command of the provinces of Asia, and when Licinius and Constantine began to make common cause with one another Maximinus entered into a secret alliance with Maxentius. He came to an open rupture with Licinius in 313, sustained a crushing defeat in the neighbourhood of Heraclea Pontica on the 30th of April, and fled, first to Nicomedia and afterwards to Tarsus, where he died in August following.

His death was variously ascribed to despair, to poison, and to the divine justice.” Maximinus has a bad name in Christian annals, as having renewed persecution after the publication of the toleration edict of Galerius, but it is probable that he has been judged too harshly.

See MAXENTIUS; Zosimus ii. 8; Aurelius Victor, Epit. 40.

MAXIMS, LEGAL. A maxim is an established principle or proposition. The Latin term maximus is not to be found in Roman law with any meaning exactly analogous to that of a legal maxim in the modern sense of the word, but the treatises of many of the Roman jurists on Regularae definitiones, and Sententiae juris, are, in some measure, collections of maxims (see an article on “Latin Maxims in English Law” in Law Mag. and Rev. xx. 285); Fortescue (De laudibus, c. 8) and Du Cange treat maxima and regula as identical. The attitude of early English commentators towards the maxims of the law was one of unmingled adulation. In Doctor and Student (p. 26) they are described as “of the same strength and effect in the law as statutes be.” Coke (Co. Litt. 11 a) says that a maxim is so called “Quia maxima est ejus dignitatis et certissima autoritatis, atque quod maxime omnibus probetur.” “Not only,” observes Bacon in the Preface to his Collection of Maxims, “will the use of maxims be in deciding doubt and helping soundness of judgment, but, further, in grading argument, in correcting unprofitable subtility, and reducing the same to a more sound and substantial sense of law, in reclaiming vulgar errors, and, generally, in the amendment in some measure of the very nature and temper of the law. A similar note was sounded in Scotland; and it has been well said that “a glance at the pages of Morrison’s Dictionary or at other early reports will show how frequently in the older Scots law questions respecting the rights, remedies and liabilities of individuals were determined by an immediate reference to legal maxims” (J. M. Irving, Encyclo. Scots Law, s.v. “Maxims”). In later times less value has been attached to the maxims of the law, as the development of civilization and the increasing complexity of business relations have shown the necessity of qualifying the propositions which they enunciate (see Stephen, Hist. Crim. Law, ii. 94 n: Yarmouth v. France, 1887, 19 Q.B.D., per Lord Esher, at p. 653, and American authorities collected in Bouvier’s Law Dict. s.v. “Maxim”). But both historically and practically they must always possess interest and value.

A brief reference need only be made here, with examples by way of illustration, to the field which the maxims of the law cover.

Comminging with rules founded on public policy, we may note the famous principle—Salus populi suprema lex (xii. Tables: Bacon, Maxims, reg. 12)—“the public welfare is the highest law.” It is easy, however, to see that the maxim that “every man is bound to maintain his own liberty in a hundred matters is based. To the same category belong the maxims—Summa est ratio quem rei religioso facit (Co. Litt. 341 a)—“the best rule is that which advances religion”—a maxim found, applied by Lord Bacon in giving a declaration of the enforcement of foreign laws or judgments supposed to violate our common laws of natural justice is in question; and Dies dominicus non est iurisdictionis, which exempts Sunday from the lawful days for juridical acts. (3) The maxim refers to the crown, the most important are Rex non potest peccare (2 Rolle, 305): “The King can do no wrong”—which enshrines the principle of ministerial responsibility, and Nullum tempus occurrat regi (2 Co. Inst. 273)—“lapse of time does not bar the crown,” a maxim qualified by various enactments in modern times. Passing to the judicial office and the administration of justice, we may refer to the rules—Adui alteram partem—a proposition too familiar to need either translation or comment; Neminem legem esse iudex in proprium saeud causam (12 Co. Rep. 114)—“no man may be judge in his own cause”; in France, the legal and the systems based upon or allied to it, have embodied in it an elaborate network of rules for judicial challenge; and the maxim which defines the relative functions of judge and jury, Ad quaestionem referendum, iudicium rei et timeat nisi iudicem de jure iurisdirenti iuratores (8 Co. Rep. 155). The maxim Boni judicis est ampliare iurisdictionem (Ch. Pec. 329) is certainly erroneous as it stands, as a judge has no right to extend his jurisdiction.” If justitiam is the maxim, it is directed to the judge. Jurisdiction should be limited (1 Burr. 304), the maxim is near the truth. A group of maxims supposed to embody certain fundamental principles of legal right and obligations may next be referred to: (a) Ubi jus ibi remedium (Co. Litt. 397 b)—“there is justice in everything,” (b) Legentur juratores, ibid. “a action on the case,” by which wrong unknown to the “original writ” were dealt with, was historically due, but which must be taken with the gloss Damien abaque injuria,—there are forms of actual damage which do not constitute legal injury,” for which the law supplies no remedy; (b) Actus Dei neminem facit iurisparam (2 Blackstone, 122)—and its allied maxim, Lex non cogit ad impossibilitatem (Co. Litt. 231 b)—on which the whole doctrine of vis major (force majeure) and impossible conditions in the law of contract has been.
PROCESSIONS AND PARADES

X. Maximus, the name of four Roman emperors.

I. M. Claudius Pupienus Maximus, joint emperor with D. Cælius Calvinus Balbinus during a few months of the year A.D. 238. Pupienus was a distinguished soldier, who had been proconsul of Bithynia, Achaia, and Gallia Narbonensis.

At the advanced age of seventy-four, he was chosen by the senate with Balbinus to resist the barbarian Maximinian. Their complete equality is shown by the fact that each assumed the titles of pontifex maximus and princeps senatus. It was arranged that Pupienus should take the field against Maximinian, while Balbinus remained at Rome to maintain order, a task in which he signalized. A revolt of the praetorians was not suppressed till much blood had been shed and a considerable part of the city reduced to ashes. On his march, Pupienus received the news that Maximinian had been assassinated by his own troops, returned in triumph to Rome. Shortly afterwards, when the emperors were on the point of leaving the city on an expedition—Pupienus against the Persians and Balbinus against the Goths—practically both, but Maximus had always considered the appointment of the senatorial emperors and cherished the memory of the soldier-emperor Maximinus, seized the opportunity of revenge. When most of the people were at the Capitoline games, they forced their way into the palace, dragged Balbinus and Pupienus through the streets, and put them to death.

See Capitolinus, Life of Maximus and Balbinus; Herodian vii. 10, viii. 6; Zonaras xi. 16; Orosius vii. 19; Eutropius ii. 2; Zosimus i. 14; Aurelius Victor, Cæsares, 26, epit. 26; H. Schiller, Geschichte der römischen Kaiserzeit, i.; Gibbon, Decline and Fall, ch. 7 and (for the chronology) appendix 12 (Bury's edition).

II. Magnus Maximus, a native of Spain, who had accompanied Theodosius on several expeditions and from 386 held high military rank in Britain. The disaffected troops having proclaimed Maximus emperor, he crossed over to Gaul, attacked Grattian (q.v.), and drove him from Paris to Lyons, where he was murdered by a partisan of Maximus. Theodosius being unable to avenge the death of his colleague, an agreement was made (384 or 385) by which Maximus was recognized as Augustus and sole emperor in Gaul, Spain and Britain, while Valentinian II. was to remain unmolested in Italy and Illyricum. Theodosius retaining his sovereignty in the East. In 387 Maximus crossed the Alps, Valentinian was speedily put to flight, while the invader established himself in Milan and for the time became master of Italy. Theodosius now took vigorous measures. Advancing with a powerful army, he twice defeated the troops of Maximus—at Siclèa on the Save, and at Poetovio on the Danube. He then hurried on to Aquileia, where Maximus had shut himself up, and had him beheaded. Under the name of Maxen Wledig, Maximus appears in the list of Welsh royal heroes (see R. Williams, Bûg, Dict. of Eminent Welshmen, 1853; "The Dream of Maxen Wledig," in the Harmsworth). Full account with classical references in H. Richter, Das west-römische Reich, besonders unter den Kaiser Graetian, Valentinian II. and Maximus (1886); see also H. Schiller, Geschichte der römischen Kaiserzeit, ii. (1887); Gibbon, Decline and Fall, ch. 27; Tillet, Hist. des empereurs, vi. 35, 36; Tillet, Hist. des empereurs, vii.

III. Maximus Tyranus, made emperor in Spain by the Roman general, Gerontius, who had rebelled against the usurper Constantine in 408. After the defeat of Gerontius at Arelate (Arles) and his death in 411 Maximus renounced the imperial title and was permitted by Constantine to retire into private life. About 418 he rebelled again, but, falling in his attempt, was seized, carried into Italy, and put to death at Ravenna in 422.

See Orosius vii. 42; Zosimus vi. 5; Sozomen ix. 3; E. A. Freeman, "The Tyrants of Britain, Gaul and Spain, A.D. 406-411." in English Historical Review, i. (1886).

IV. Petronius Maximus, a member of the higher Roman nobility, had held several court and public offices, including those of praefectus Romae (420) and Italiae (439-441 and 445), and consul (433, 443). He was one of the intimate associates of Valentinian III., whom he assisted in the palace intrigues which led to the death of Aëtius in 454; but an outrage committed on the wife of Maximus by the emperor turned his friendship against him. Maximus was proclaimed emperor immediately after Valentinian's murder (March 16, 452), but after reigning less than three months, he was murdered by some Burgundian mercenaries as he was fleeing before the troops of Genericius, who, invited by Eudoxia, the widow of Valentinian, had landed at the mouth of the Tiber (May or June 455).

See Procopius, Vand. i. 4; Sidonius Apollinaris, Panegyr. Aviti, ep. ii. 13; the various Chronicles; Gibbon, Decline and Fall, chs. 35, 36; Tillet, Hist. des emperors, vii.

MAXIMUS, ST. (c. 580-662), abbot of Chrysopolis, known as "the Confessor" from his orthodox zeal in the Monothelitism (q.v.) controversy, or as "the monk," was born of noble parentage at Constantinople about the year 580. Educated with great care, he early became distinguished by his talents and acquirements, and some time after the accession of the emperor Heraclius in 610 was made his private secretary. In 630 he purchased the secular life and entered the monastery of Chrysopolis (Scutari). Admitted, he believed, less by any longing for a life of retirement than by dissatisfaction he felt with the Monothelite leavings of his master. The date of his promotion to the abbacy is uncertain. In 633 he was one of the party of Sophronius of Jerusalem (the chief opponent of the Monothelites) at the council of Alexandria; and in 645 he was again in Africa, where he held in presence of the governor and a number of bishops the dispute with Pyrrhus, the deposed and banished patriarch of Constantinople, which resulted in the (temporary) conversion of his interlocutor to the Dyothelite view. In the following year several African synods, held under the influence of Maximus, declared for orthodoxy. In 649, after the accession of Martin I., he went to Rome, and did much to fan the zeal of the new pope, who on
October of that year held the (first) Lateran synod, by which not only the Monothelite doctrine but also the moderating euchesis of Heraclius and typus of Constans II. was anathematized. About 653 Maximus, for the part he had taken against the latter document especially, was apprehended (together with the pope) by order of Constans and carried a prisoner to Constantinople. In 655, after repeated examinations, in which he maintained his theological opinions with memorable constancy, he was banished to Byzia in Thrace, and afterwards to Perberis. In 662 he was again brought to Constantinople and was condemned by a synod to be scourged, to have his tongue cut out by the root, and to have his right hand chopped off. After this sentence had been carried out he was again banished to Lazica, where he died on the 13th of August 662. He is venerated by a saint both in the Greek and in the Latin Churches. Maximus was not only a leader in the Monothelite struggle but a mystic who zealously followed and advocated the system of Pseudo-Dionysius, while adding to it an ethical element in the conception of the freedom of the will. His works had considerable influence in shaping the system of John Scotus Erigena.

The most important of the works of Maximus will be found in Migne, Patrologia graeca, xc. xxi., together with an anonymous life; an exhaustive list of Maximus's manuscripts in vol. xii. (1903) of Hauck-Hertzog's Realencyklopadie where the following classification is adopted: (a) exegetical; (b) scholia on the Fathers; (c) dogmatic and controversial; (d) ethical and ascetic; (e) miscellaneous. The details of his life run into a large volume. The only life, given very fully and clearly in Hefele's Conciliengeschichte. iii. For further literature see H. Gelzer in C. Krambacher's Geschichte der byzantinischen Literatur (1897).

MAXIMUS OF SMYRNA, a Greek philosopher of the Neo-platonist school, who lived towards the end of the 4th century A.D. He was perhaps the most important of the followers of Iamblichus. He is said to have been of a rich and noble family, and exercised great influence over the emperor Julian, who was commended to him by Aedesius. He pondered to the emperor's love of magic and theurgy, and by judicious administration of the omens won a high position at court. His overbearing manner made him numerous enemies, and, after being imprisoned on the death of Julian, he was put to death by Valens. He is a representative of the least attractive side of Neoplatonism. Attaching no value to logical proof and argument, he enlarged on the wonders and mysteries of nature, and maintained his position by the working of miracles. In logic he is reported to have agreed with Eusebius, Iamblichus and Porphyry in asserting the validity of the second and third figures of the syllogism.

MAXIMUS OF TYRE (CASSIUS MAXIMUS TYRIUS), a Greek rhetorician and philosopher who flourished in the time of the Antonines and Commodus (2nd century A.D.). After the manner of the sophists of his age, he travelled extensively, delivering lectures on the way. His writings contain many allusions to the history of Greece, while there is little reference to Rome; hence it is inferred that he lived longer in Greece, perhaps as a professor at Athens. Although nominally a Platonist, he is really an Eclectic and one of the precursors of Neoplatonism. There are still extant by him forty-one essays or discourses (διάλεξεις) on theological, ethical, and other philosophical commonsenses. With him God is the supreme being, one and indivisible though called by many names, accessible to reason alone; but as animals form the intermediate stage between plants and human beings, so there exist intermediaries between God and man, viz. daemons, who dwell on the confines of heaven and earth. The soul in many ways bears a great resemblance to the divinity; it is partly mortal, partly immortal, and, when freed from the fetters of the body, becomes a daemon. Life is the sleep of the soul, from which it awakes at death. The style of Maximus is superior to that of the ordinary sophistical rhetorician, but scholars differ widely as to the merits of the essays themselves.

Maximus of Tyre must be distinguished from the Stoic Maximus, tutor of Marcus Aurelius.

Editions by J. Davies, revised with valuable notes by J. Markland (1749); J. J. Reiske (1774); F. Dümmer (1840, with Theophrastus, &c., in the Didot series). Monographs by R. Robich (Beuthen, 1879); H. Hobein, De Maximo Tyrio quaestiones philol. (Jena, 1895). There is an English translation (1804) by Thomas Taylor, the orientalist.

MAX MÜLLER, FRIEDRICH (1823–1900), Anglo-German orientalist and comparative philologist, was born at Dessau on the 6th of December 1823, being the son of Wilhelm Müller (1794–1827), the German poet, celebrated for his phil-Hellenic lyric, who was ducal librarian at Dessau. The elder Müller had endeared himself to the most intellectual circles in Germany by his amiable character and his genuine poetic gift; his songs had been utilized by musical composers, notably Schubert; and it was his son's good fortune to meet in his youth with a succession of eminent friends, who, already interested in him for his father's sake, and charmed by the qualities which they discovered in the young man himself, powerfully aided him by advice and patronage. Mendelssohn, who was his godfather, dissuaded him from inducing his natural bent to the study of music; Professor Brockhaus of the University of Leipzig, where Maximus Müller matriculated in 1841, induced him to take up Sanskrit; Bopp, at the University of Berlin (1844), made the Sanskrit of this student a scientific comparative philologist; and afterwards, when he came to the same university, inspired him with a love for metaphysical speculation, though failure to attract him to his own philosophy; Burnouf, at Paris in the following year, by teaching him Zend, started him on the track of inquiry into the science of comparative religion, and impelled him to edit the Rig Veda; and when, in 1846, Max Müller came to England upon this errand, Bunsen, in conjunction with Professor H. H. Wilson, prevailed upon the East India Company to undertake the expense of publication. Up to this time Max Müller had lived the life of a poor student, supporting himself partly by copying manuscripts, but Bunsen's introductions to Queen Victoria and the prince consort, and to Oxford University, laid the foundation for him of fame and fortune. In 1848 the printing of his Rig Veda at the University Press obliged him to settle in Oxford, a step which decided his future career. He arrived at a favourable conjuncture: the Tractarian strife, which had so long thrust learning into the background, was just over, and Oxford was becoming accessible to modern ideas. The young German excited curiosity and interest, and it was soon discovered that, although a genuine scholar, he was no mere bookworm. Part of his social success was due to his ability to impart knowledge to pupils, and of the immense talents at private parties. Max Müller were speedily substituted for theLIEBE, M. Max Müller, 1823–1900, German scholar 216

Though Max Müller's reputation was that of a comparative philologist and orientalist, his professional duties at Oxford were long confined to lecturing on modern languages, or at least on modern forms. In 1860 the death of Horace Hayman Wilson, professor of Sanskrit, seemed to open a more congenial sphere to him. His claims to the succession seemed contestable, for his opponent, Monier Williams, though well qualified as a Sanskritist, lacked Max Müller's brilliant versatility, and although educated at Oxford, had held no University
office. But Max Müller was a Liberal, and the friend of Liberals in university matters, in politics, and in theology, and this consideration united with his foreign birth to bring the country clergy in such hosts to the poll that the voice of resident Oxford was overborne, and Monier Williams was elected by a large majority. It was the one great disappointment of Max Müller's life, and made a lasting impression upon him. It was, nevertheless, serviceable to his influence and reputation by permitting him to enter upon a wider field of subjects than would have been possible otherwise. Directly, Sanskrit philology received little more from him, except in connexion with his later undertaking of *The Sacred Books of the East*; but indirectly he exalted it more than any predecessor by proclaiming its commanding position in the history of the human intellect by his *Science of Language*, two courses of lectures delivered at the Royal Institution in 1861 and 1863. Max Müller ought not to be described as "the introducer of comparative philology into England." Pritchard had proved the Aryan affinities of the Celtic languages by the methods of comparative philology so long before as 1831; Winning's *Manual of Comparative Philology* had been published in 1838; the discoveries of Bopp and Pott and Pictet had been recognized in brilliant articles in the *Quarterly Review*, and had guided the researches of Rawlinson. But Max Müller undoubtedly did far more to popularise the subject than had been done, or could have been done, by any predecessor. He was on less sure ground in another department of the study of language—the problem of its origin. He wrote upon it as a disciple of Kant, whose *Critique of Pure Reason* he translated. His essays on mythology are among the most delightful of his writings, but their value is somewhat impaired by a too uncompromising adherence to the seductive generalisation of the solar myth.

Max Müller's studies in mythology led him to another field of activity in which his influence was more durable and extensive, that of the comparative science of religions. Here, so far as Great Britain is concerned, he does deserve the name of an originator, and his *Introduction to the Science of Religion* (1873; the same year in which he lectured on the subject, at Dean Stanley's invitation, in Westminster Abbey, this being the only occasion on which a layman had given an address there) marks an epoch. It was followed by other works of importance, especially the four volumes of Gifford lectures, delivered between 1888 and 1892; but the most tangible result of the impulse he had given was the publication under his editorship, from 1875 onwards, of *The Sacred Books of the East*, in fifty-one volumes, in one hundred and three quarters, and under his superintendence during his lifetime. These comprise translations by the most competent scholars of all the really important non-Christian scriptures of Oriental nations, which can now be appreciated without a knowledge of the original languages. Max Müller also wrote on Indian philosophy in his latter years, and his exertions to stimulate search for Oriental manuscripts and inscriptions were rewarded with important discoveries of early Buddhist scriptures, in their Indian form, made in Japan. He was on particularly friendly terms with native Japanese scholars, and after his death his library was purchased by the university of Tōkyō.

In 1868 Max Müller had been indemnified for his disappointment over the Sanskrit professorship by the establishment of a chair of Comparative Philology to be filled by him. He retired, however, from the actual duties of the post in 1875, when entering upon the editorship of *The Sacred Books of the East*. The most remarkable external events of his latter years were his delivery of lectures at the restored university of Strassburg in 1872, when he devoted his honorarium to the endowment of a Sanskrit lecturership, and his presidency over the International Congress of Orientalists in 1892. But his days, if uneventful, were busy. He participated in every movement at Oxford of which he could approve, and was intimate with nearly all its men of light and leading; he was a curator of the Bodleian Library, and a delegate of the University Press. He was acquainted with most of the crowned heads of Europe, and was an especial favourite with the English royal family. His hospitality was ample, especially to visitors from India, where he was far better known than any other European Orientalist. His distinctions, conferred by foreign governments and learned societies, were innumerable, and, having been naturalized shortly after his arrival in England, he received the high honour of being made a privy councillor. In 1888 and 1889 he published autobiographical reminiscences under the title of *Auld Long Syne*. He was writing a more detailed autobiography when overtaken by death on the 28th of October 1900. Max Müller married in 1859 Georgiana Adelie Grenfell, sister of the wives of Charles Kingsley and J. A. Froude. One of his daughters, Mrs Conybeare, distinguished herself by a translation of Scheter's *History of German Literature*.

Though undoubtedly a great scholar, Max Müller did not so much represent scholarship pure and simple as her hybrid types—the scholar-author and the scholar-courtier. In the former capacity, though manifesting little of the originality of genius, he rendered vast service by popularizing high truths among high minds. In his public and social character he represented Oriental studies with a brilliancy, and conferred upon them a distinction, which they had not previously enjoyed in Great Britain. There were drawbacks in both respects: the author was too prone to build upon insecure foundations, and the man of the world incurred censure for fallings which may perhaps be best indicated by the remark that he seemed too much of a diplomatist. But the sum of foibles seems insignificant in comparison with the life of intense labour dedicated to the service of culture and humanity.

Max Müller's *Collected Works* were published in 1903. (R. G.)

**MAXWELL** (FAMILY)

The name of a Scottish family, members of which have held the titles of earl of Morton, earl of Nithsdale, Lord Maxwell, and Lord Herries. The name is taken probably from Maccuswell, or Maxwell, near Kelso, whether the family migrated from England about 1100. Sir Herbert Maxwell won great fame by defending his castle of Carlawock against Edward I. in 1300; another Sir Herbert was made a lord of the Scottish parliament before 1445; and his great-grandson John, 3rd Lord Maxwell, was killed at Flodden in 1513. John's son Robert, the 4th lord (d. 1546), was a member of the royal council under James V.; he was also an extraordinary lord of session, high admiral, and warden of the west marches, and was taken prisoner by the English at the rout of Solway Moss in 1542. Robert's grandson John, 7th Lord Maxwell (1553-1603), had the qualifications of both lord and son of Robert, the 5th lord (d. 1552), and his wife Beatrice, daughter of James Douglas, 3rd earl of Morton. After the execution of the regent Morton, the 4th earl, in 1561 this earldom was bestowed upon Maxwell, but in 1586 the attainder of the late earl was reversed and he was deprived of his new title. He had helped in 1585 to drive the royal favourite James Stewart, earl of Arran, from power, and he made active preparations to assist the invading Spaniards in 1588. His son John, the 8th lord (c. 1586-1613), was at feud with the Johnstones, who had killed his father in a skirmish, and with the Douglases over the earldom of Morton, which he regarded as his inheritance. After a life of exceptional and continuous lawlessness he escaped from Scotland and in his absence was sentenced to death; having returned to his native country he was seized and was beheaded in Edinburgh. In 1618 John's brother and heir Robert (d. 1640) was restored to the lordship of Maxwell, and in 1620 was created earl of Nithsdale, surrendering at this time his claim to the earldom of Morton. He and his son Robert, afterwards the 2nd earl, fought under Montrose for Charles I. during the Civil War. Robert died without sons in October 1667, when a cousin John Maxwell, 7th Lord Herries (d. 1677), became third earl.

William, 5th earl of Nithsdale (1676-1744), a grandson of the third earl, was like his ancestor a Roman Catholic and was attached to the cause of the exiled house of Stuart. In 1715 he joined the Jacobite insurgents, being taken prisoner at the battle of Preston and sentenced to death. He escaped, however,
from the Tower of London through the courage and devotion of his wife Winifred (d. 1740), daughter of William Herbert, 1st marquess of Powis. He was attainted in 1716 and his titles became extinct, but his estates passed to his son William (d. 1775), whose descendant, William Constable-Maxwell, regained the title of Lord Herries in 1838. The countess of Nithsdale wrote an account of her husband's escape, which is published in vol. i. of the Transactions of the Society of Antiquaries of Scotland.

A few words may be added about other prominent members of the Maxwell family. John Maxwell (c. 1599-1647), archbishop of Tuam, was a Scottish ecclesiastic who took the fee-simple from his wife and helped Archbishop Laud in his futile attempt to restore the liturgy in Scotland. He was bishop of Ross from 1633 until 1638, when he was deposed by the General Assembly; then crossing over to Ireland he went to the court of Dublin and Archbishop Juxon. In 1640 he was appointed bishop of Tuam from 1645 until his death. James Maxwell of Kirkconnell (c. 1708-1762), the Jacobite, wrote the Narrative of Charles Prince of Wales's Expedition to Scotland in 1755, which was printed for the Mintland Club in 1841. Robert Maxwell (1605-1756) was the author of Select Transactions of the Society of Improvers and was a great benefactor to Scottish agriculture. Sir Murray Maxwell (1775-1851), a naval officer, gained much fame by his conduct when his ship the "Alcestis" was wrecked on the coast of Nova Scotia, in 1817. William Hamilton Maxwell (1792-1850), the Irish novelist, wrote, in addition to several novels, a Life of the Duke of Wellington (1839-1841 and again 1853), and a History of the Irish Rebellion in 1798 (1847). John Maxwell of Tuam (b. 1845), member of parliament for Wigtownshire from 1888 to 1906, and president of the Society of Antiquaries of Scotland, became well known as a writer, his works including Life and Times of the Hon. Sir John Clerk of Penicuik, Bart. (1875); Life of the Duke of Wellington (1892); The House of Douglas (1902); Robert the Bruce (1897) and A Duke of Britain (1895).

MAXWELL, JAMES CLERK (1831-1879), British physicist, was the last representative of a younger branch of the well-known Scottish family of Clerk of Penicuik, and was born at Edinburgh on the 13th of November 1831. He was educated at the Edinburgh Academy (1842-1847) and the university of Edinburgh (1847-1850). Entering at Cambridge in 1850, he spent a term or two at Peterhouse, but afterwards migrated to Trinity. In 1854 he took his degree as second wrangler, and was declared equal with the senior wrangler of his year (E. J. Routh, q.v.) in the higher ordeal of the Smith's prize examination. He held the chair of Natural Philosophy in Marischal College, Aberdeen, from 1856 till the fusion of the two colleges there in 1860. For eight years subsequently he held the chair of Physics and Astronomy in King's College, London, but resigned in 1868 and retired to his estate of Glenlair in Kirkcudbrightshire. He was summoned from his seclusion in 1871 to become the first holder of the newly founded professorship of Experimental Physics in Cambridge; and it was under his direction that the plans of the Cavendish Laboratory were prepared. He superintended every step of the progress of the building and of the purchase of the very valuable collection of apparatus with which it was equipped at the expense of his munificent founder the seventh duke of Devonshire (chancellor of the university, and one of its most distinguished alumni). He died at Cambridge on the 5th of November 1879.

For more than half of his brief life he held a prominent position in the very foremost rank of natural philosophers. His contributions to scientific societies began in his fifteenth year, when Professor J. D. Forbes communicated to the Royal Society of Edinburgh a short paper of his on a mechanical method of tracing Cartesian ovals. In his eighteenth year, while still a student in Edinburgh, he contributed two valuable papers to the Transactions of the same society—one of which, "On the Equilibrium of Elastic Solids," is remarkable, not only on account of its intrinsic power and the youth of its author, but also because in it he laid the foundations of the most singular of his later life, the temporary double refraction produced in viscous liquids by shearing stress. Immediately after taking his degree, he read to the Cambridge Philosophical Society a very novel memoir, "On the Transformation of Surfaces by Bending." This is one of the few purely mathematical papers he published, and it exhibited at once to experts the full genius of its author. About the same time appeared his elaborate memoir, "On Faraday's Lines of Force," in which he gave the first indication of some of those extraordinary electrical investigations which culminated in the greatest work of his life. He obtained in 1859 the Adams prize in Cambridge for a very original and powerful essay, "On the Stability of Saturn's Rings." From 1855 to 1872 he published at intervals a series of valuable investigations connected with the "Perception of Colour" and "Colour-Blindness," for the earlier of which he received the Rumford medal from the Royal Society in 1860. The instruments which he devised for these investigations were simple and convenient, but could not have been thought of for the purpose except by a man whose knowledge was co-extensive with his ingenuity. One of his greatest investigations bore on the "Kinetic Theory of Gases." Originating with D. Bernoulli, this theory was advanced by the successive labours of John Henapath, J. P. Joule, and particularly K. Clausius, to such an extent as to put its general accuracy beyond a doubt; but it received enormous developments from Maxwell, who in this field appeared as an experimenter (on the laws of gaseous friction) as well as a mathematician. He wrote an admirable textbook of the Theory of Heat (1871), and a very excellent elementary treatise on Matter and Motion (1876).

But the great work of his life was devoted to electricity. He began by reading, with the most profound admiration and attention, the whole of Faraday's extraordinary self-revelations, and proceeded to translate the ideas of that master into the succinct and expressive notation of the mathematicians. A considerable part of this translation was accomplished during his career as an undergraduate in Cambridge. The writer had the opportunity of perusing the MS. of "On Faraday's Lines of Force," in a form little different from the final one, a year before Maxwell took his degree. His great object, as it was, also the great object of Faraday, was to overthrow the idea of action at a distance. The splendid researches of S. D. Poisson and K. F. Gauss had shown how to reduce all the phenomena of statical electricity to mere attractions and repulsions exerted at a distance by particles of an imponderable on one another. Lord Kelvin (Sir W. Thomson) had, in 1846, shown that a totally different assumption, based upon other analogies, led (by its own special mathematical methods) to precisely the same results. He treated the resultant electric force at any point as analogous to the flux of heat from sources distributed in the same manner as the supposed electric particles. This paper of Thomson's, whose ideas Maxwell afterwards developed in an extraordinary manner, seems to have given the first hint that there are at least two perfectly distinct methods of arriving at the known formulae of statical electricity. The step to magnetic phenomena was comparatively simple; but it was otherwise as regards electromagnetic phenomena, where current electricity is essentially involved. An exceedingly ingenious, but highly artificial, theory had been devised by W. E. Weber, which was found capable of explaining all the phenomena investigated by Ampère as well as the induction currents of Faraday. But this was based upon the assumption of a distance-action between electric particles, the intensity of which depended on their relative motion as well as on their position. This, of course, even more repugnant to Maxwell's mind than the statical distance-action developed by Poisson. The first paper of Maxwell's in which an attempt at an admissible physical theory of electromagnetism was made was communicated to the Royal Society in 1867. But the theory, in a fully developed form, first appeared in 1873 in his great treatise on Electricity and Magnetism. This work was one of the most splendid triumphs ever raised by the genius of a single individual. Availing himself of the admirable generalized co-ordinate system of Lagrange, Maxwell showed how to reduce all electric and magnetic phenomena to stresses and motions of a material medium, and, as one preliminary, but exceedingly severe, test of the truth of his theory, he pointed out that (if the electromagnetic medium be that which is required for the explanation of the phenomena of light) the velocity of light in vacuo should
be numerically the same as the ratio of the electromagnetic and electrostatic units. In fact, the means of the best determinations of each of these quantities separately agrees with one another more closely than do the various values of either.

One of Maxwell's last great contributions to science was the editing (with copious original notes) of the Electrical Researches of the Hon. Henry Cavendish, from which it appeared that Cavendish, already famous by many other researches (such as the mean density of the earth, the composition of water, &c.), must be looked on as, in his day, a man of Maxwell's own stamp as a theorist and an experimenter of the very first rank.

In private life Clerk Maxwell was one of the most lovable of men, a sincere and unostentatious Christian. Though perfectly free from any trace of envy or ill-will, he yet showed on fit occasion his contempt for that pseudo-science which seeks for the applause of the ignorant by professing to reduce the whole system of the universe to a fortuitous sequence of uncased events.

His collected works, including the series of articles on the properties of matter, such as "Atom," "Attraction," "Capillary Action," "Diffusion," "Ether," &c., which he contributed to the 9th edition of this encyclopaedia, were issued in two volumes by the Cambridge University Press in 1800; and an extended biography, by his former schoolfellow and lifelong friend Professor Lewis Carrell, was published in 1882.

MAXWELLTOWN, a burgh of barony and police burgh of Kirkcudbrightshire, Scotland. Pop. (1901), 5796. It lies on the Nith, opposite to Dumfries, with which it is connected by three bridges, being united with it for parliamentary purposes. It has a station on the Glasgow & South-Western line from Dumfries to Kirkcudbright. Its public buildings include a court-house, the prison for the south-west of Scotland, and an observatory and museum, housed in a disused windmill. The chief manufactures are woollens and hosiery, besides dyeworks and sawmills. It was a hamlet known as Bridgend up till 1810, in which year it was erected into a burgh of barony under its present name. To the north-west lies the parish of Terregles, said to be a corruption of Tir-eglws (terra eclesia, that is, "Kirk land"). The parish contains the beautiful ruin of Lincluden Abbey (see Dumfries), and Terregles House, once the seat of William Maxwell, last earl of Nithsdale. In the parish of Lochrutton, a few miles south-west of Maxwelton, there is a good example of a stone circle, the "Seven Grey Sisters," and an old peel-tower in the Mains of Hils.

MAY, PHIL (1864-1903), English caricaturist, was born at Wortley, near Leeds, on the 22nd of April 1864, the son of an engineer. His father died when the child was nine years old, and at twelve he had begun to earn his living. Before he was fifteen he had acted as time-keeper at a foundry, had tried to become a jockey, and had been on the stage at Scarborough and Leeds. When he was about seventeen he went to London with a sovereign in his pocket. He suffered extreme want, sleeping out in the parks and streets, until he obtained employment as designer to a theatrical costumer. He also sold woodcuts, posters and cartoons, and for about two years worked for the St Stephen's Review, until he was advised to go to Australia for his health. During the three years he spent there he was attached to the Sydney Bulletin, for which many of his best drawings were made. On his return to Europe he went to Paris by way of Rome, where he worked hard for some time before he appeared in 1892 in London to resume his interrupted connexion with the St Stephen's Review. His studies of the London "guttersnipe" and the coster-girl rapidly made him famous. His overflowing sense of fun, his genuine sympathy with his subjects, and his kindly wit were on a par with his artistic ability. It was often said that the extraordinary economy of line which was a characteristic feature of his drawings had been forced upon him by the deficiencies of the printing machines of the Sydney Bulletin. It was in fact the result of a laborious process which involved a number of preliminary sketches, and of a carefully considered system of elimination. His later work included some excellent political portraits. He became a regular member of the staff of Punch in 1896, and in his later years his services were retained exclusively for Punch and the Graphic. He died on the 5th of August 1903.

There was an exhibition of his drawings at the Fine Arts Society in 1895, and another at the Leicester Galleries in 1903. A selection of his drawings contributed to the periodical press and from Phil May's Annual and Phil May's Sketch Books, with a portrait and biography of the artist, entitled The Phil May Folio, appeared in 1903.

MAY, THOMAS (1595-1650), English poet and historian, son of Sir Thomas May of Mayfield, Sussex, was born in 1595. He entered Sidney Sussex College, Cambridge, in 1609, and took his B.A. degree three years later. His father having lost his fortune and sold the family estate, Thomas May, who was hampered by an impediment in his speech, made literature his profession. In 1620 he produced The Heir, an ingeniously constructed comedy, and, probably about the same time, The Old Couple, which was not printed until 1658. His other dramatic works are classical tragedies on the subjects of Antigone, Cleopatra, and Agrippina. F. G. Fleay has suggested that the more famous anonymous tragedy of Nero (printed 1624, reprints in A. H. Bullen's Old English Plays and the Mermaid Series) should also be assigned to May. But his most important work in the department of pure literature was his translation (1627) into heroic couplets of the Pharsalia of Lucan. Its success led May to write a continuation of Lucan's narrative down to the death of Charles I. He became his patron, and commissioned him to write metrical histories of Henry II. and Edward III., which were completed in 1655. When the earl of Pembroke, then lord chamberlain, broke his staff across May's shoulders at a masque, the king took him under his protection as "my poet," and Pembroke made him an apology accompanied with a gift of £50. These marks of the royal favour seem to have led May to expect the posts of poet-laureate and city chronicler when they fell vacant on the death of Ben Jonson in 1637, but he was disappointed, and he forsook the court and attached himself to the party of the Parliament. In 1646 he is styled one of the "secretaries" of the Parliament, and in 1647 he published his best known work, The History of the Long Parliament. In this official apology for the moderate or Presbyterian party, he professes to give an impartial statement of facts, unaccompanied by any expression of party or personal opinion. If he refrained from actual invective, he accomplished his purpose "more to Guizot's advantage, and the destruction and dissimulation." Accusations of this kind were foreseen by May, who says in his preface that if he gives more information about the Parliament men than their opponents it is that he was more conversant with them and their affairs. In 1650 he followed this with another work written with a more definite bias, a Breviary of the History of the Parliament of England, in Latin and English, in which he defended the position of the Independents. He stopped short of the catastrophe of the king's execution, and it seems likely that his subservience to Cromwell was not quite voluntary. In February 1650 he was brought to London from Weymouth under a strong guard for having spread false reports of the Parliament and of Cromwell. He died on the 13th of November in the same year, and was buried in Westminster Abbey, but after the Restoration his remains were exhumed and buried in a pit in the yard of St Margaret's, Westminster. May's change of side made him many bitter enemies, and he is the object of scathing condemnations from many of his contemporaries.

There is a long notice of May in the Biographia Britannica. See also W. J. Courthope, Hist. of Eng. Poetry, vol. 3; and Guizot, Etudes biographiques sur la révolution d'Angleterre (pp. 493-426, ed. 1851).

MAY, or MEY(E), WILLIAM (d. 1560), English divine, was the brother of John May, bishop of Carlisle. He was educated at Cambridge, where he was a fellow of Trinity Hall, and in 1537, president of Queen's College. May heartily supported the Reformation, signed the Ten Articles in 1536, and helped in the production of The Institution of a Christian Man. He had close connexion with the diocese of Ely, being
successively chancellor, vicar-general and prebendary. In 1545 he was made a prebendary of St Paul's, and in the following year dean. His favourable report on the Cambridge colleges saved them from dissolution. He was dispossessed during the reign of Mary, but restored to the deanery on Elizabeth's accession. He died on the day of his election to the archbishopric of York.

May, the fifth month of our modern year, the third of the old Roman calendar. The origin of the name is disputed; the derivation from Maia, the mother of Mercury, to whom the Romans were accustomed to sacrifice on the first day of this month, is usually accepted. The ancient Romans used on May Day to go in procession to the grotto of Egeria. From the 28th of April to the 2nd of May was kept the festival in honour of Flora, goddess of flowers. By the Romans the month was regarded as unlucky for marriages, owing to the celebration on the 9th, 11th and 13th of the Lemuria, the festival of the unhappy dead. This superstition has survived to the present day.

In medieval and Tudor England, May Day was a great public holiday. All classes of the people, young and old alike, were up with the dawn, and went "a-Maying" in the woods. Branches of trees and flowers were borne back in triumph to the towns and villages, the centre of the procession being occupied by those who shouldered the maypole, glorious with ribbons and wreaths. The maypole was usually of birch, and set up for the day only; but in London and the larger towns the poles were of durable wood and permanently erected. They were special eyesores to the Puritans. John Stubbes in his Anatomy of Abuses (1583) speaks of them as those "stinkying idols," about which the people "leape and daunce, as the heathen did." Maypoles were forbidden by the parliament in 1644, but came once more into favour at the Restoration, the last to be erected in London being that set up in 1661. This pole, which was of cedar, 134 ft. high, was set up by twelve British sailors under the personal supervision of James II., then duke of York and lord high admiral, in the Strand on or about the site of the present church of St Mary's-in-the-Strand. Taken down in 1717, it was conveyed to Wanstead Park in Essex, where it was fixed by Sir Isaac Newton as part of the support of a large telescope, presented to the Royal Society by a French astronomer.

For an account of the May Day survivals in rural England see P. H. Ditchfield, Old English Customs extant at Present Times (1897).

May, Isle of, an island belonging to Fifeshire, Scotland, at the entrance to the Firth of Forth, 5 m. S.E. of Crail and Anstruther. It has a N.W. to S.E. trend, is more than 1 m. long, and measures at its widest about ¾ m. St Adrian, who had settled here, was martyred by the Danes about the middle of the 9th century. The ruins of the small chapel dedicated to him, which was a favourite place of pilgrimage, still exist. The place where the pilgrims—of whom James IV. was often one—landed is yet known as Pilgrims' Haven, and traces may yet be seen of the various wells of St Andrew, St John, Our Lady, and the Pilgrims, though their waters have become brackish. In 1495 Sir Andrew Wood of Largo, with the "Yellow Company" and "Mayflower," captured the English sea-boat Stephen Bull, and three ships, after a fierce fight which took place between the island and the Bass Rock. In 1616 a coal beacon was lighted on the May and maintained by Alexander Cunningham of Barns. The oil light substituted for it in 1816 was replaced in 1888 by an electric light.

Maya, an important tribe and stock of American Indians, the dominant race of Yucatan and other states of Mexico and part of Central America at the time of the Spanish conquest. They were then divided into many nations, chief among them being the Maya proper, the Huastecs, the Tzental, the Pokom, the Mame and the Cakchiquel and Quiché. They were spread over Yucatan, Vera Cruz, Tabasco, Campeche, and Chiapas in Mexico, and over the greater part of Guatemala and Salvador. In civilization the Mayan peoples rivalled the Aztecs. Their traditions give as their place of origin the extreme north; thence a migration took place, perhaps at the beginning of the Christian era. They appear to have reached Yucatan as early as the 5th century. From the evidence of the Quiché chronicles, which are said to date back to about 1 A.D. 700, Guatemala was shortly afterwards overrun. Physically the Mayans are a dark-skinned, round-headed, short and sturdy type. Although they were already decimated when the Spaniards arrived they made a fierce resistance. They still form the bulk of the inhabitants of Yucatan. For their culture, ruined cities, &c., see Central America and Mexico.

Mayaguez, the third largest city of Porto Rico, a seaport, and the seat of government of the department of Mayaguez, on the west coast, at the mouth of Rio Yaguez, about 72 m. W. by S. of San Juan. Pop. of the city (1899), 15,187; including 1381 negroes and 4711 of mixed races; (1910), 16,501; of the municipal district, 35,700 (1899), of whom 2687 were negroes and 9033 were of mixed races. Mayaguez is connected by the American railroad of Porto Rico with San Juan and Ponce, and it is served regularly by steamboats from San Juan, Ponce and New York, although its harbour is not accessible to vessels drawing more than 16 ft. of water. It is situated at the foot of Las Mesas mountain, and commands picturesque views. The climate is healthy and good water is obtained from the mountain region. From the shipping district along the water-front a thoroughfare leads to the main portion of the city, about 1 m. distant. There are four public squares, in one of which is a statue of Columbus. Prominent among the public buildings are the City Hall (containing a public library), San Antonio Hospital, Roman Catholic churches, a Presbyterian church, the court-house and a theatre. The United States has an agricultural experiment station here, and the Insular Reform School is 1 m. south of the city. Coffee, sugar-cane and tropical fruits are grown in the surrounding country; and the business of the city consists chiefly in their export and the import of flour. Among the manufactures are sugar, tobacco and chocolate. Mayaguez was founded about the middle of the 18th century on the site of a hamlet which was first settled about 1680. It was incorporated as a town in 1836, and became a city in 1873. In 1841 it was nearly all destroyed by fire.

Mayavaram, a town of British India, in the Tanjore district of Madras, on the Cauvery river; junction on the South Indian railway, 174 m. S.W. of Madras. Pop. (1901), 24,276. It possesses a speciality of fine cotton and silk cloth, known as Kornad from the suburb in which the weavers live. During October and November the town is the scene of a great pilgrimage to the holy waters of the Cauvery.

Maybole, a burgh of barony and police burgh of Ayrshire, Scotland. Pop. (1901), 5892. It is situated 9 m. S. of Ayr and 50 m. S.W. of Glasgow by the Glasgow & South-Western railway. It is an ancient place, having received a charter from Duncan II. in 1103. In 1516 it was made a burgh of regality, but for generations it remained under the subjection of the Kennedys, afterwards earls of Cassillis and marquesses of Ailsa, the most powerful family in Ayrshire. Of old Maybole was the capital of the district of Carrick, and for long its characteristic feature was the family mansions of the barons of Carrick. The castle of the earls of Cassillis still remains. The public buildings include the town-hall, the Assembly Rooms, and the Lumsden fresh-air and rest homes, and the Maybole combination poorhouse. The leading manufactures are of boots and shoes and agricultural implements. Two miles to the south-west are the ruins of Crossraguel (Cross of St Regulus) Abbey, founded about 1240. Kirkoswald, where Burns spent his seventeenth year, learning land-surveying, lies a little farther west. In the parish churchyard lie "Tam o' Shanter" (Douglas Graham) and "Souter Johnnie" (John Davidson). Four miles to the west of Maybole on the coast is Culzean Castle, the chief seat of the marquesses of Ailsa, dating from 1777; it stands on a basaltic cliff, beneath which are the Coves of Culzean, once the retreat of outlaws and a resort of the fairies. Farther south are the ruins of Turnberry Castle, where Robert Bruce is said to have been born. A few miles to the north of Culzean are the ruins of Dunure Castle, an ancient stronghold of the Kennedys.
MAYEN—MAYENNE

MAYEN, a town of Germany, in the Prussian Rhine province, on the northern declivity of the Eifel range, 10 m. W. from Coblenz, on the railway Andernach-Gerolstein. Pop. (1905), 13,435. It is still partly surrounded by medieval walls, and the ruins of a castle rise above the town. There are some small industries, embracing textile manufactures, oil mills and tanneries, and a trade in wine, while near the town are extensive quarries of basalt. Having been a Roman settlement, Mayen became a town in 1291. In 1689 it was destroyed by the French.

MAYENNE, CHARLES OF LORRAINE, DUKE OF (1554-1611), second son of Francis of Lorraine, second duke of Guise, was born on the 26th of March 1554. He was absent from France at the time of the massacre of Saint Bartholomew, but took part in the siege of La Rochelle in the following year, when he was created duke and peer of France. He went with Henry of Valois, duke of Anjou (afterwards Henry III.), on his election as king of Poitou, but soon returned to France to become the energetic supporter and lieutenant of his brother, the 3rd duke of Guise. In 1577 he gained conspicuous successes over the Huguenot forces in Poitou. As governor of Burgundy he raised his province in the cause of the League in 1585. The assassination of his brothers at Blois on the 23rd and 24th of December 1588 left him at the head of the Catholic party. The Venetian ambassador, Mocenigo, states that Mayenne had warned Henry III. that there was a plot afoot to seize his person and to send him by force to Paris. At the time of the murder he was at Lyons, where he received a letter from the king saying that he had acted on his warning, and ordering him to retire to his government. Mayenne professed obedience, but immediately made preparations for marching on Paris. After a vain attempt to recover the persons of those of his relatives who had been arrested at Blois he proceeded to recruit troops in his government of Burgundy and in Champagne. Paris was devoted to the house of Guise and had been roused to fury by the news of the murder. When Mayenne entered the city in February 1589 he found it dominated by representatives of the sixteen quarters of Paris, all fanatics of the League. He formed a council general to direct the affairs of the city and to make new relations with the other towns faithful to the League. To this council each quarter sent four representatives, and Mayenne added representatives of the various trades and professions of Paris in order to counterbalance this revolutionary element. He constituted himself "lieutenant-general of the state and crown of France," taking his oath before the parlement of Paris. In April he advanced on Tours. Henry III. in his extremity sought an alliance with Henry of Navarre, and the allied forces drove the leaguers back, and had laid siege to Paris, when the murder of Henry III. by a Dominican fanatic changed the face of affairs and gave new strength to the Catholic party.

Mayenne was urged to claim the crown for himself, but he was faithful to the official programme of the League and proclaimed Charles, cardinal of Bourbon, at that time a prisoner in the hands of Henry IV., as Charles X. Henry IV. retired to Dieppe, followed by Mayenne, who joined his forces to those of the Catholics, and the three last-mentioned charge de Cosse, comte de Bressieux, and engaged the royal forces in a succession of fights in the neighbourhood of Arques (September 1589). He was defeated and outnumbered by Henry IV., who moved on Paris, but retreated before Mayenne's forces. In 1590 Mayenne received additions to his army from the Spanish Netherlands, and took the field again, only to suffer complete defeat at Ivry (March 14, 1590). He then escaped to Mantes, and in September collected a fresh army at Meaux, and with the assistance of Alexander Farnese, prince of Parma, sent by Philip II., raised the siege of Paris, which was about to surrender to Henry IV. Mayenne feared with reason the designs of Philip II., and his difficulties were increased by the death of Charles X., the "king of the league." The extreme section of the party, represented by the Sixteen, urged him to proceed to the election of a Catholic king and to accept the help and the claims of their Spanish allies. But Mayenne, who had not the popular gifts of his brother, the duke of Guise, had no sympathy with the demagogues, and himself inclined to the moderate side of his party, which began to urge reconciliation with Henry IV. He maintained the ancient forms of the constitution against the revolutionary policy of the Sixteen, who during his absence from Paris took the law into their own hands and in November 1591 executed one of the leaders of the more moderate party, Barnabé Brisson, president of the parlement. He returned to Paris and executed four of the chief malcontents. The power of the Sixteen diminished from that time, but with it the strength of the League.1

Mayenne entered into negotiations with Henry IV. while he was still appearing to consider with Philip II. the succession to the French crown of the Infanta Elizabeth, granddaughter, through her mother Elizabeth of Valois, of Henry II. He demanded that Henry IV. should accomplish his conversion to Catholicism before he was recognized by the leaguers. He also desired the continuation to himself of the high offices which had accumulated in his family and the reservation of their provinces to his relatives among the leaguers. In 1593 he summoned the states generale to Paris and placed before them the claim of the Infanta, but they protested against foreign intervention. Mayenne signed a truce at La Villette on the 31st of July 1593. The internal dissensions of the league continued to increase, and the principal chiefs submitted. Mayenne finally made his peace only in October 1595. Henry IV. allowed him the possession of Chalon-sur-Saône, of Soissons and for three years, made him governor of the Isle of France and paid a large indemnity. Mayenne died at Soissons on the 3rd of October 1611.

A Histoire de la vie et de la mort du duc de Mayenne appeared at Lyons in 1618. See also J. B. H. Capeghé, Hist. de la Régence, de la ligue et du règne de Henri IV. (8 vols., 1834-1835) and the literature dealing with the house of Guise (p.a.).

MAYENNE, a department of north-western France, three-fourths of which formerly belonged to Lower Maine and Anjou, and the rest to the Province of the N. by Manche and Orne, and E. by Sarthe, S. by Maine-et-Loire and W. by Ille-et-Vilaine. Area, 2012 sq. m. Pop. (1906), 305,457. Its ancient geological formations connect it with Brittany. The surface is agreeably undulating; forests are numerous, and the beauty of the cultivated portions is enhanced by the hedgerows and lines of trees by which the farms are divided. The highest point of the department, and indeed of the whole north-west of France, is the Mont des Avaloirs (1368 ft). Hydrographically Mayenne belongs to the basins of the Loire, the Vilaine and the Sélune, the first mentioned draining by far the larger part of the entire area. The principal stream is the Mayenne, which passes successively from north to south through Mayenne, Laval and Château-Gontier; by means of weirs and sluices it is navigable below Mayenne, but traffic is inconsiderable. The chief afluents are the Jouvanne on the left, and on the right the Colmont, the Érne and the Oudon. A small area in the east of the department drains by the Ève into the Sarthe; the Sélune rises in the S., and in the north-west two small rivers flow into the Sélune. The climate of Mayenne is generally healthy except in the neighbourhood of the numerous marshes. The temperature is lower and the moisture of the atmosphere greater than in the neighbouring departments; the rainfall (about 32 in. annually) is above the average for France.

Agriculture and stock-raising are prosperous. A large number of horned cattle are reared, and in no other French department are

---

1 The estates of the League in 1593 were the occasion of the famous Saitre Minisippe, circulated in MS. in that year, but only printed at Tours in 1594. It was the work of a circle of men of letters who belonged to the politiques or party of the centre and ridiculed the futility of the League. The authors were Pierre Le Roy, Jean Perard, Florent Chrestien, Nicolas Kapin and Pierre Pithou. It opened with "La vertu du catholicon," in which a Spanish quack (the cardinal of Plassais) vaunts the virtues of his drug "catholicon composé," manufactured in the Escorial, while a Lorraine rival (the cardinal of Pellevo) tries to sell a rival cure. A mock account of the estates, with harangues delivered by Mayenne and the other chiefs of the League, followed. Mayenne's discourse is said to have been written by the jurist Pithou.
so many horses found within the same area; the breed, that of Craon, is famed for its strength. Craon has also given its name to the most prized breed of pigs in western France. Mayenne produces excellent butter and poultry and a large quantity of honey. The cultivation of the vine is very limited, and the most common beverage is cider. Wheat, oats, barley and buckwheat, in the order named, are the most important crops, and a large quantity of flax and hemp is produced. Game is abundant. The timber grown is chiefly beech, oak, birch, elm and chestnut. The department produces a considerable amount of stone and marble, and with other stones are quarried. There are several chalybeate springs. The industries include flour-milling, brick and tile making, brewing, cotton and wool spinning, and the production of various textile fabrics (especially ticking) for which Laval and Château-Gontier are celebrated. Other products include agricultural implements, making, wood and marble sawing, tannin and dyeing.

The Homann’s atlas (1750), to which reference has been made, contains 175 maps and a political map of France, with each arrondissement of the nation shown separately. It is a remarkable map of the time, and has been frequently reprinted.

MAYENNE—MAYER, J. R.

A county of north-western France, capital of an arrondissement in the department of Mayenne, 19 m. N.N.E. of Laval by rail. Pop., town 7003, commune 10,620. Mayenne is an old feudal town, irregularly built on hills on both sides of the river Mayenne. Of the old castle overlooking the river several towers remain, one of which has retained its conical roof; the vaulted chambers and chapel are ornamented in the style of the 13th century; the building is now used as a prison. The church of Notre-Dame, beside which there is a statue of Joan of Arc, dates partly from the 12th century; the choir was rebuilt in the 19th century. In the Place de Cheverus is a statue, by David of Angers, to Cardinal Jean de Cheverus (1768-1836), who was born in Mayenne. Mayenne has a subprefecture, tribunals of first instance and of commerce, a chamber of arts and manufactures, and a board of trade-arbitration. There is a school of agriculture in the vicinity. The chief industry of the place is the manufacture of tallow, linen, handkerchiefs and calicoes.

Mayenne had its origin in the castle built here by Jehel, son of Maistre Jean de Cheverus, a noble of the baron of Geoffrey of Maine, in the beginning of the 13th century. It was taken by the English in 1424, and several times captured by the opposing parties in the wars of religion and the Vendée. At the beginning of the 16th century the territory passed to the family of Guise, and in 1573 was made a duchy in favour of Charles of Mayenne, leader of the League.

MAYER, JOHANN TOBIAS (1723-1762), German astronomer, was born at Marbach, in Württemberg, on the 17th of February 1723, and brought up at Esslingen in poor circumstances. A self-taught mathematician, he had already published two original geometrical works when, in 1746, he entered J. B. Homann’s cartographic establishment at Nuremberg. Here he introduced many improvements in map-making, and gained a scientific reputation which led (in 1751) to his election to the chair of economy and mathematics in the university of Göttingen. In 1754 he became superintendent of the observatory, where he laboured with great zeal and success until his death, on the 20th of February 1763. His first important work was a careful investigation of the libration of the moon (Kosmographische Nachrichten, Nuremberg, 1750), and his chart of the full moon (published in 1755) was unsurpassed for half a century. But his fame rests chiefly on his lunar tables, communicated in 1752, with new solar tables, to the Royal Society of Göttingen, and published in their Transactions (vol. ii.). In 1755 he submitted to the English government an amended body of MS. tables, which James Bradley compared with the Greenwich observations, and found to be sufficiently accurate to determine the moon’s place to 75°, and consequently the longitude at sea to about half a degree. An improved set was afterwards published in London (1779), as also the theory (Theoria lunae rotunda et stationis, basel, 1767) upon which the tables are based. His widow, by whom they were sent to England, received in consideration from the British government a grant of £3000. Appended to the London edition of the solar and lunar tables are two short tracts—the one on determining longitude by lunar distances, together with a description of the repeating circle (invented by Mayer in 1752), the other on a formula for atmospheric refraction, which applies a remarkably accurate correction for temperature.

Mayer left behind him a considerable quantity of manuscript, part of which was collected by G. C. Lichtenberg and published in one volume (Opera inedita, Göttingen, 1775). It contains an easy and accurate method for calculating eclipses; an essay on colour, in which three primary colours are recognised; a catalogue of 908 zodiacal stars; and a memoir, the earliest of any real value, on the proper motion of eighty stars, originally communicated to the Göttingen Royal Society in 1760. The manuscript residue includes papers on atmospheric refraction (dated 1753), on the perturbations of the perturbations of the moon and the Earth (1756), and to the perturbations of the Sun (1760 and 1762). In these last Mayer sought to explain the magnetic action of the earth by a modification of Euler’s hypothesis, and made the first really definite attempt to establish a mathematical theory of magnetic action (C. Hansteen, Magnetismus der Erde, i. 285). E. Klinkerfuss published in 1891; photo-lithographic reproductions of Mayer’s local charts and irregular map of the moon; and his star-catalogue was re-edited by F. Baily in 1830 (Memoirs Roy. Astr. Soc. iv. 391) and by G. F. J. A. Auvers in 1894.

MAYER, JULIUS ROBERT (1814-1878), German physicist, was born at Heilbronn on the 23rd of November 1814, studied medicine at Tübingen, Munich and Paris, and after a journey to Java in 1840 as surgeon of a Dutch vessel obtained a medical post in his native town. He claims recognition as an independent priori propounder of the “First Law of Thermodynamics,” but more especially as having early and ably applied that law to the explanation of many remarkable phenomena, both cosmical and terrestrial. His first little paper on the subject, “Bemerkungen über die Kräfte der unbekannte Natur,” appeared in 1842 in Liebig’s Annalen, five years after the republication, in the same journal, of an extract from K. F. Mohr’s paper on the nature of heat, and three years later he published Die organische Bewegung in ihren Zusammenhange mit dem Stoffwechsel.

It has been repeatedly claimed for Mayer that he calculated the value of the dynamical equivalent of heat, indirectly, no doubt, but together almost without error, and with a result very nearly with that obtained by J. F. Joule after years of patient labour in direct experiment. This claim on Mayer’s behalf was first made to be baseless by W. Thomson (Lord Kelvin) and P. C. Tait, in a well-known article on energy, published in Good Words in 1862, which gave rise to a long but lively discussion. A calm and judicial annihilation of the claim is to be found in a brief article by Sir G. G. Stokes, Proc. Roy. Soc., 1871, p. 54. See also Maxwell’s Theory of Heat (1871), chap. xii. Mayer entirely ignored the grand fundamental principle laid down by Sadi Carnot—that nothing can be concluded as to the relation between heat and work from an experiment in which the working substance is left at the end of an operation in a different chemical state from that in which it was placed at the commencement. Mayer has also been styled the discoverer of the fact that heat consists in the (energy of) motion, a matter settled at the very end of the 18th century by Count Rumford and Sir H. Davy; but in the teeth of this statement we have Mayer’s own words, “We might much rather assume the contrary—that in order to become heat motion must cease to be motion.”
MAYFLOWER—MAY-FLY

Mayer’s real merit consists in the fact that, having for himself made out, on inadequate and even questionable grounds, the conservation of energy, and having obtained (though by inaccurate reasoning) a numerical result correct so far as his data permitted, he applied the principle to the question of weight and power, and to the estimation of numerous physical phenomena. His papers, which were published in a single volume with the title Die Mechanik der Wärme (3rd ed., 1853), are of unequal merit. But some, especially those dealing with the gas laws and the question of temperature, and some of his examples of what really valuable work may be effected by a man of high intellectual powers, in spite of imperfect information and defective logic.

Doubtless it would appear exaggerated, estimates of Mayer are given in John Tyndall’s papers in the Phil. Mag., 1863–1864 (whose avowed object was “to raise a noble and a suffering man to the position which his labours entitled him to occupy”), and in E. Dühnig’s Robert Mayer, der Gründer des letzten Jahrhunderts, Chertsey, 1892. The simple facts of the case are summarized by Tait in the Phil. Mag., 1864, ii. 289.

MAYFLOWER, the vessel which carried from Southampton, England, to Plymouth, Massachusetts, the Pilgrims who established the first permanent colony in New England. It was of about 180 tons burden, and in company with the “Speedwell” sailed from Southampton on the 5th of August 1620, the two having on board 120 Pilgrims. After two trials the “Speedwell” was pronounced unsavoury, and the “Mayflower” sailed alone from Plymouth, England, on the 6th of September with the 100 (or 102) passengers, some of whom on the 11th of November (o.e.) signed the famous Mayflower Compact in Provincetown Harbor, and a small party of whom, including William Bradford, separated from the vessel at what is now Plymouth, Massachusetts, on the 11th of December (21st N.S.), an event which is celebrated, as Forefathers’ Day, on the 22nd of December. A “General Society of Mayflower Descendants” was organized in 1894 by lineal descendants of the “Mayflower” to “preserve their memory, their records, their history, and all facts relating to them, their ancestors and their posterity.” Every lineal descendant, over eighteen years of age, of any passenger of the “Mayflower” is eligible to membership. Branch societies have since been organized in several of the states and in the District of Columbia, and a triennial congress is held in Plymouth.

See Axel Ames, The May-Flower and Her Log (Boston, 1901); Blanche McManus, The Voyage of the Mayflower (New York, 1897); The General Society of Mayflower: Meetings, Officers and Members, arranged in State Societies, Ancestors and their Descendants (New York, 1901). Also the articles PLYMOUTH, Mass.; MASSACHUSETTS, § History; PILGRIM; and PROVINCETOWN, Mass.

MAY-FLY. The Mayflies belong to the Ephemerae, a remarkable family of winged insects, included by Linnaeus in his order Neoptera, which derive their scientific name from ἔφεμος, “ephemeron,” from the Greek term for a short-lived creature. It is possible that they have scarcely more than one day’s existence, but others are far longer lived, though the extreme limit is probably rarely more than a week. The family has very sharply defined characters, which separate its members from all other Neuroptera (or pseudo-neuroptera) groups.

These insects are universally aquatic in their preparatory states. The eggs are dropped into the water by the female in large masses, resembling, in some species, bunches of grapes in miniature. Probably several months elapse before the young larvae are excluded. The sub-aquatic condition lasts a considerable time: in Cloeon, a genus of small and delicate species, Sir J. Lubbock (Lord Avebury) proved it to extend over more than six months; but in larger and more robust genera (e.g. Palenogia) there appears reason to believe that the greater part of three years is occupied in preparatory conditions.

The larva is long, slender, and transparent, and is furnished at first with five simple eyes of nearly equal size; but as it increases in size the homologues of the facetted eyes of the imago become larger, whereas those equivalent to the ocelli remain small. The antennae are long and thread-like, composed at first of about ten segments, but the number increases at each moult. The mouth parts are well developed, consisting of an upper lip, powerful mandibles, maxillae with three-jointed palpi, and a deep quadrifid labium or lower lip with three-jointed labial palp. Distinct and conspicuous maxillae are associated with the tongue or hypopharynx. There are three distinct and large thoracic segments, whereof the prothorax is narrower than the others; the legs are much shorter and stouter than in the winged insect, with monomerous tarsi terminated by a single claw. The abdomen consists of ten segments; the tenth furnished with long and slender sensory organs, and appendage-like outgrowths from the two first, but an intermediate segment develops itself (though this latter is often lost in the winged insect). Respiration is effected by means of external gills placed along both sides of the dorsum of those of the abdominal segments. There is an extraordinary number of species and forms: in some species they are entire plates, in others they are cut up into numerous divisions, in all cases traversed by numerous tracheal ramifications. According to the researches of Lubbock and others, the happenings of the May-flying insect have been described, and the respiration is effected through the skin. Lubbock traced at least twenty molts in Cloeon; at about the tenth rudiments of the wing-cases began to appear. These gradually become larger, and when fully developed are shed, when the insect is a “nymph.”

The most aberrant type of larva is that of the genus Prospisphasia, which is small and delicately colored, with a slender body, and an abdomen in which the abdominal segments are mostly merged. There is some reason to believe that the nymphs pass through a series of forms, or stages, but there is no condition analogous to the pupa-stage of insects with complete metamorphoses.

There may be said to be three or four different modes of life in these larvae: some are fossorial, and form tubes in the mud or clay, in which they live; others are found on or beneath stones; while others again swim and crawl freely among water plants. It is probable that some are carnivorous, either attacking other larvae or subsisting on more minute forms of animal life, but others perhaps feed more exclusively on vegetable matters of a low type, such as diatoms.

The most aberrant type of larva is that of the genus Prospisphasia, which is small and delicately colored, with a slender body, and an abdomen in which the abdominal segments are mostly merged. There is some reason to believe that the nymphs pass through a series of forms, or stages, but there is no condition analogous to the pupa-stage of insects with complete metamorphoses.

When the aquatic insect has reached its full growth it emerges from the water or seeks its surface; the thorax splits down the back and the winged form appears. But this is not yet perfect, although it has all the form of a perfect insect and is capable of flight; it is what is variously termed a “pseud-imgo,” “sub-imgo” or “pro-imgo.” Contrary to the habits of all other insects, there yet remains a pellicle that has to be pealed off when the insect is dry; the insect is thus enveloped in a skin which is effectuated soon after the insect’s appearance in the winged form; the creature seeks a temporary resting-place, the pellicle splits down the back, and the now perfect insect comes forth, often differing very greatly in colours and markings from the condition in which it was only a few moments before. If the observer takes up a suitable position near water, his coat is often seen to be covered with the cast sub-imago skins of these insects, which had chosen him as a convenient object upon which to undergo their final change. In some few genera of very low type it appears probable that, at any rate in the female, this final change is never effected and that the creature dies a sub-imgo.

The winged insect differs considerably in form from its sub-aquatic condition. The head is smaller, often occupied almost entirely above the male by very large eyes, which in some species are curiously double in that sex, one portion being pigmented, and forming what is termed a “turban,” the mouth parts are aborted, for the creature is now incapable of taking nourishment either solid or fluid; the secondary maxillae are shortened and bristled, consisting of two rather large basal joints and a multi-articulate thread. The prothorax is much narrowed, whereas the other segments (especially the mesothorax) are greatly enlarged; the legs long and slender, the anterior pair often reduced to mere stumps; the tarsal segments of the tarsus of the anterior and posterior leg pairs numerous and of equal length; the mouth in its four- or five-jointed; but in some genera (e.g. Oligoneura and allies) the legs are aborted, and the creatures are driven helplessly about by the wind. The winged forms are less abundant than in the sub-imago stage, the anterior pair large, and the posterior pair small and short; the mid-dorsal membranous area is greatly reduced; in the male the male joint becomes forked at the base; the male the male organ extends a little beyond the junction of the seventh and eighth ventral segments. The independent opening of the genital ducts and the absence of an ecdyosomal vagina and ejaculatory duct are remarkable features of these insects, as has been pointed out by J. A. Palma. The sexual act takes place in the air, and is of very short duration, but is apparently repeated several times, at any rate in some cases.

Ephemerae are found all over the world, even up to high northern latitudes. F. J. Picket, E. A. Eaton and others have
given us valuable works or monographs on the family; but the subject still remains little understood, partly owing to the great difficulty of preserving such delicate insects; and it appears probable they can only be satisfactorily investigated as moist preparations. The number of described species is less than 200, spread over many genera.

From the earliest times attention has been drawn to the enormous abundance of species of the family in certain localities. Johann Anton Scopoli, writing in the 18th century, speaks of them as so abundant in one place in Carniola that in June twenty cart-loads were carried away for manure! *Polyomitturus virgo*, which, though not found in England, occurs in many parts of Europe (and is common at Paris), emerges from the water soon after sunset, and continues for several hours in such myriads as to resemble snow showers, putting out lights, and causing inconvenience to man, and annoyance to horses by entering their nostrils. In other parts of the world they have been recorded in multitudes that obscured passers-by on the other side of the street. And similar records might be multiplied almost to any extent. In Britain, although they are often very abundant, we have scarcely anything analogous.

Fish, as is well known, devour them greedily, and enjoy a veritable feast during the short period in which any particular species appears. By angler the common English species of *Ephemera* (sulga or darning, but more properly, that latter, which is more abundant) is known as the "molly," but the terms "green drake" and "bastard drake" are applied to conditions of the same species. Useful information on this point will be found in Ronalds’ *Fly-Fisher’s Entomology*, edited by Westwood.

Ephemerae belong to a very ancient type of insects, and fossil imprints of allied forms occur even in the Devonian and Carboniferous formations.

There is much to be said in favour of the view entertained by some entomologists that the structural and developmental characteristics of may-flies are sufficiently peculiar to warrant the formation for them of a special order of insects, for which the names Agnatha, Plecoptera and Ephemeroptera have been proposed. (See Hexapoda, Neuroptera.)

**Bibliography.**—Of special value to students of these insects are A. E. Eaton’s monograph (*Trans. Linn. Soc.* 2 (ii. 1833–1835) and 3 (1838)) and that of his successors’ *Recherches sur l’organisation des larves* (Ann. Sci. Nat. Zool. 6 (iii. 1832 (7) ix. 1836). J. A. Palmén’s *Mémoire sur la Morphologie du Troncetissement* (Leipzig, 1867) and *Über paare Ausgangszüge der Geschlechtsorgane bei Insekten* (Helsingfors, 1864), contain important observations on may-flies. See also *Phil. Trans.* 1840, and *New York State Museum*, Bull. 86. 1905.

(R. McL.; G. H. C.)

**MAYHEM** (for derivation see MAILING), an old Anglo-French term of the law signifying an assault whereby the injured person is deprived of a member proper for his defence in fight, *e.g.* an arm, a leg, a fore tooth, &c. The loss of an ear, jaw tooth, &c., was not mayhem. The most ancient punishment in English law was retaliative—*membrum pro membro*, but ultimately at common law fine and imprisonment. Various statutes were passed aimed at the offence of maiming and disfiguring, which is now dealt with by section 18 of the Offences against the Person Act 1861. Mayhem may also be the ground of a civil action, which this peculiarity that the court on sight of the wound might increase the damages awarded by the jury.

**MAYHEW, HENRY** (1812–1887), English author and journalist, son of a London solicitor, was born in 1812. He was sent to Westminster school, but ran away to sea. He sailed to India, and on his return studied law for a short time under his father. He began his journalistic career by founding, with Gilbert & Beckett, in 1831, a weekly paper, *Figaro in London*. This was followed in 1832 by a short-lived paper called *The Theriac*, and he produced one or two successful farces. His brothers Horace (1816–1872) and Augustus Septimus (1826–1875) were also journalists, and with them Henry occasionally collaborated, notably with the younger in *The Greatest Plague of Life* (1847) and in *Acting Charades* (1850). In 1841 Henry Mayhew was one of the leading spirits in the foundation of *Punch*, of which he was for the first two years joint-editor with Mark Lemon. He afterwards wrote on all kinds of subjects, and published a number of volumes of no permanent reputation—humorous stories, travel and practical handbooks. He is credited with being the first to "write up" the poverty side of London life from a philanthropic point of view; with the collaboration of John Binny and others he published *London Labour and London Poor* (1854; completed 1864) and other works on social and economic questions. He died in London, on the 25th of July 1887. Horace Mayhew was for some years sub-editor of *Punch*, and was the author of several humorous publications and plays. The books of Horace and Augustus Mayhew owe their survival chiefly to Cruikshank's illustrations.

**MAYHEW, JONATHAN** (1720–1766), American clergyman, was born at Martha's Vineyard on the 8th of October 1720, being fifth in descent from Thomas Mayhew (1592–1682), an early settler and the grantee (1641) of Martha's Vineyard. Thomas Mayhew (c. 1616–1677), the younger, his son John (d. 1689) and John's son, Experience (1673–1758), were active missionaries among the Indians of Martha's Vineyard and the vicinity. Jonathan, the son of Experience, graduated at Harvard in 1744.

So liberal were his theological views that when he was to be ordained minister of the West Church in Boston in 1747 only two ministers attended the first council called for the ordination, and he was ordained to the same council. Mayhew's preaching made his church practically the first "Unitarian" Congregational church in New England, though it was never officially Unitarian. In 1753 he published *Observations on the Charter and Conduct of the Society for Propagating the Gospel in Foreign Parts*, an attack on the policy of the society in sending missionaries to New England contrary to its original purpose of "Maintaining Ministers of the Gospel" in places "wholly destitute and unprovided with means for the maintenance of ministers and for the public worship of God;" the *Observations* marked him as a leader among those in New England who feared, as Mayhew said (1763), "that there is a scheme forming for sending a bishop into this part of the country, and that our Governor, a true churchman, is deeply in the plot." To an American reply to the *Observations*, entitled *A Candid Examination* (1763), Mayhew wrote a *Defense*; and after the publication of an *Answer*, anonymously published in London in 1764 and written by Thomas Secker, archbishop of Canterbury, he wrote a *Second Defense*. He bitterly opposed the Stamp Act, and urged the necessity of colonial union (or confederation) to secure colonial liberty. He died on the 9th of July 1768.

Mayhew was Dudleian lecturer at Harvard in 1765, and in 1749 had received the degree of D.D. from the University of Aberdeen.

**MAYHEW, THOMAS,** English 18th century cabinet-maker. Mayhew was the less distinguished partner of William Ince (q.v.). The chief source of information as to his work is supplied by his own drawings in the volume of designs, *The universal system of household furniture*, which he published in collaboration with his partner. The name of the firm appears to have been Mayhew and Ince, but on the title page of this book the names are reversed, perhaps as an indication that Ince was the more extensive contributor. In the main Mayhew's designs are heavy and clumsy, and often downright extravagant, but he had a certain lightness of accomplishment in his applications of the bizarre Chinese style. Of original talent he possessed little, yet it is certain that much of his Chinese work has been attributed to Chippendale. It is indeed often only by reference to books of design that the true work of the English cabinet-makers of the second half of the 18th century can be correctly attributed.

**MAYMO,** a hill sanctuary in India, in the Mandalay district of Upper Burma, 3300 ft. above the sea, with a station on the
Mandaly-Lashio railway 422 m. from Rangoon. Pop. (1901), 62,235. It consists of an undulating plateau, surrounded by hills, which are covered with thin oak forest and bracken. Though not entirely free from malaria, it has been chosen for the summer residence of the lieutenant-governor; and it is also the permanent headquarters of the lieutenant-general commanding the Burma division, and of other officials.

MAYNARD, FRANÇOIS DE (1582-1646), French poet, was born at Toulouse in 1582. His father was conseiller in the parlement of the town, and François was also trained for the law, becoming eventually president of Avrilac. He became secretary to Margaret of Valois, wife of Henry IV., for whom his early poems are written. He was a disciple of Malherbe, who said that in the workmanship of his lines he excelled Racan, but lacked his rival's energy. In 1634 he accompanied the Cardinal de Noailles to Rome and spent about two years in Italy. On his return to France he made many unsuccessful efforts to obtain the favour of Richelieu, but was obliged to retire to Toulouse. He never ceased to lament his exile from Paris and his inability to be present at the meetings of the Academy, of which he was one of the earliest members. The best of his poems is in imitation of Horace, "Alcippe, reviens dans nos bois." He died at Toulouse on the 23rd of December 1646. His works consist of odes, epigrams, songs and letters, and were published in 1646 by Marin le Roy de Gomberville.

MAYNE, JASPER (1604-1672), English author, was baptized at Hatherleigh, Devonshire, on the 23rd of November 1604. He was educated at Westminster School and at Christ Church, Oxford, where he had a distinguished career. He was presented to two college livings in Oxfordshire, and was made D.D. in 1646. During the Commonwealth he was dispossessed, and became chaplain to the duke of Devonshire. At the Restoration he was made canon of Christ Church, archdeacon of Chichester and chaplain in ordinary to the king. He wrote a farcical domestic comedy, The City Match (1639), which is reprinted in vol. xvii. of Hazlitt's edition of Dodsley's Old Plays, and a fantastic tragi-comedy entitled The Amorous War (printed 1648). After receiving ecclesiastical preferment he gave up poetry as unbecoming his profession. His other works comprise some occasional gems, a translation of Lucian's Dialogues (printed 1664) and a number of sermons. He died on the 6th of December 1672 at Oxford.

MAYNOOTH, a small town of county Kildare, Ireland, on the Midland Great Western railway and the Royal Canal, 15 m. W. of Dublin. Pop. (1901), 1,638. The Royal Catholic College of Maynooth, founded by an Act of the Irish parliament in 1795, is the chief seminary for the education of the Roman Catholic clergy of Ireland. The building is a fine Gothic structure by A. W. Pugin, erected by a parliamentary grant obtained in 1846. The chapel, with fine oak choir-stalls, mosaic pavements, marble altars and stained glass, and with adjoining cloisters, was dedicated in 1890. The average number of students is about 500—the number specified under the act of 1845—and the full course of instruction is eight years. Near the college stand the ruins of Maynooth Castle, probably built in 1176, but subsequently extended, and formerly the residence of the FitzGerald family. It was besieged in the reigns of Henry VIII. and Edward VI., and during the Cromwellian Wars, when it was demolished. The beautiful mansion of Carton is about a mile from the town.

MAYO, RICHARD SOUTHWELL BOURKE, 6th Earl of (1822-1872), British statesman, son of Robert Bourke, the 5th earl (1797-1867), was born in Dublin on the 21st of February, 1822, and was educated at Trinity College, Dublin. After travelling in Russia he entered parliament, and sat successively for Kildare, Coleraine and Cockermouth. He was chief secretary for Ireland in three administrations, in 1823, 1858 and 1866, and was appointed viceroy of India in January 1869. He consolidated the frontiers of India and met Shere Ali, amir of Afghanistan, in durbar at Umballa in March 1869. His reorganization of the finances of the country put India on a paying basis; and he did much to promote irrigation, railways, forests and other useful public works. Visiting the convict settlement at Port Blair in the Andaman Islands, for the purpose of inspection, the viceroy was assassinated by a convict on the 8th of February 1872. His successor was his son, Dermot Robert Wyndham Bourke (b. 1831) who became 7th earl of Mayo.

See Sir W. W. Hunter, Life of the Earl of Mayo, (1876), and The Earl of Mayo in the Rulers of India Series (1891).

MAYO, a western county of Ireland, in the province of Connacht, bounded N. and W. by the Atlantic Ocean, N.E. by Sligo, E. by Roscommon, S.E. and S. by Galway. The area is about 1,575 sq. m., or about 500 sq. m., the county being the largest in Ireland after Cork and Galway. About two-thirds of the boundary of Mayo is formed by sea, and the coast is very much indented, and abounds in picturesque scenery. The principal inlets are Killary Harbour between Mayo and Galway; Clew Bay, in which are the harbours of Westport and Newport; Blacksod Bay and Broad Haven, which form the peninsula of the Mullet; and Killala Bay between Mayo and Sligo. The islands are very numerous, the principal being Inishert, near Killary Harbour; Clare Island, at the mouth of Clew Bay, where there are many islets, all formed of drift; and Achill, the largest island off Ireland. The coast scenery is not surpassed by that of Donegal northward and Connemara southward, and there are several small coast-towns, among which may be named Killala and Belmullet. The coast is separated from Blacksod Bay and Broad Haven, Newport and Westport on Clew Bay, with the watering-place of Mallaranny. The majestic cliffs of the north coast, however, which reach an extreme height in Benwee Head (892 ft.), are difficult of access and rarely visited.

In the eastern half of the county the surface is comparatively level, with occasional hills; the western half is mountainous. Mweelrea (2688 ft.) is included in a mountain range lying between Killary Harbour and Lough Mask. The next highest summits are Nephin (2510 ft.), to the west of Lough Conn, and Crouch Patrick (2510 ft.), to the south of Clew Bay. The river Moy flows northwards, forming part of the boundary of the county with Sligo, and falls into Killala Bay. The courses of the other streams are short, and except when swollen by rains their volume is small. The principal lakes are Lough Mask and Lough Corrib, on the borders of the county with Galway, and Loughs Conn in the east, Carrowmore in the north-west, Beltra in the west, and Carra adjoining Lough Mask. These loughs and the smaller loughs, with the streams generally, afford admirable sport for salmon, sea-trout and brown trout, and Ballina is a favourite centre.

Geology.—The wild and barren west of this county, including the great hills on Achill Island, is formed of "Dalradian" rocks, schists and quartzites, highly folded and metamorphosed, with intrusions of "Precambrian" granite and porphyry. Black Beds, which are rare near Blacksod, have been quarried as an ornamental stone. Nephin Beg, Nephin and Creagh Patrick are typical quartzite summits, the last named belonging possibly to a Silurian horizon but rising from a metamorphic area on the south side of Clew Bay. The schists and gneisses of the Ox Mountain axis also enter the county north of Castlebar. The Mulrera and Ben Gorm range, bounding the fine jorul of Killary Harbour, is formed of terraced Silurian rocks, from Bala to Ludlow age. These beds, with intercalated laves, form the mountainous west shore of Lough Mask, the east, like that of Lough Corrib, being formed of low Carboniferous Limestone ground. Silurian rocks, with Old Red Sandstone, and of Duplex series and Carboniferous Limestone, are seen at the mouth of Killala Bay. The land and mountains, except those of the Curlew range at Ballaghaderreen, Clew Bay, with its islands, the submergence of which by glacial drift, is a submerged part of a synclinal of Carboniferous strata, and Old Red Sandstone comes out on the north coast from Whitehead to Inishturk. The country from Lough Conn northward to the sea is a lowland of Carboniferous Limestone, with L. Carboniferous Sandstone and slates between the Danes on the west.

There are some very fertile regions in the level portions of the county, but in the mountainous districts the soil is poor, the holdings are subdivided beyond the possibility of affording proper sustenance to their occupiers, and, except where fishing is the chief occupation, the cottiers and other poor are among the most wretched of any district of Ireland. The proportion of tillage to pastureage is roughly as 1 to 3. Oats and potatoes are the principal crops. Cattle, sheep, pigs and poultry are reared. Coarse linen and woollen cloths are manufactured to a small extent. At Foxford woollen-mills are established at a nursery, in connexion with a scheme of technical instruction. Keel, Ballymullet and Ballycastle are the headquarters of sea and
coast fishing districts, and Ballina of a salmon-fishing district, and these fisheries are of some value to the poor inhabitants. A branch of the Midland Great Western railway enters the county from Athlone, in the south-east, and runs north to Ballina and Killala on the coast, branches diverging from Claremorris to Ballinrobe, and from Manulla to Westport and Achill on the west coast. The Limerick and Sligo line of the Great Southern and Western passes from south to north-east by way of Claremorris.

Population and Administration.—The population was 218,608 in 1891, and 199,166 in 1901. The decrease of population and the number of emigrants are slightly below the average of the Irish counties. Of the total population about 97% are rural, and about the same percentage are Roman Catholics. The chief towns are Ballina (pop. 4509), Westport (3802) and Castlebar (3585), the county town. Ballaghaderreen, Claremorris (Clare), Crossmolina and Swineford are lesser market towns; and Westport are small seaports on Clew Bay. The county includes nine baronies. Assizes are held at Castlebar, and quarter sessions at Ballina, Ballinrobe, Belmullet, Castlebar, Claremorris, Swineford and Westport. In the Irish parliament two members were returned for the county, and two for the borough of Castlebar, but at the union Castlebar was disfranchised. The division since 1885 is into north, south, east and west parliamentary divisions, each returning one member. The county is in the Protestant diocese of Tuam and the Roman Catholic dioceses of Tuam, Achonry, Galway and Kilmacduagh, and Killala.

History and Antiquities.—Erris in Mayo was the scene of the landing of the chief colony of the Fibolgs, and the battle which is said to have resulted in the overthrow and almost annihilation of this tribe took place also in this county, at Moytura near Cong. At the close of the 12th century what is now the county of Mayo was granted, with other lands, by King John to William, brother of Hubert de Burgh. After the murder of William de Burgh, 3rd earl of Ulster (1333), the Barkes (de Burghs) of the collateral male line, returning from their exile in France (among them is the heir Lionel, son of King Edward III.) to the succession, succeeded in holding the bulk of the De Burgh possessions, what is now Mayo falling to the branch known by the name of “MacWilliam Oughter,” who maintained their virtual independence till the time of Elizabeth. Sir Henry Sydney, during his first viceroyalty, after making efforts to improve communications between Dublin and Connaught in 1566, arranged for the shiring of that province, and Mayo was made shire ground, taking its name from the monastery of Maio or Mago, which was the seat of a bishop. Even after this period the MacWilliams continued to exercise very great authority, which was regularized in 1603, when “the MacWilliam Oughter,” Theobald Bourke, surrendered his lands and received them back, to hold them by English tenure, with the title of Viscount Mayo (see BURGH, DE). Large confiscations of the estates in the county were made in 1586, and on the termination of the wars of 1641; and in 1666 the restoration of his estates to the 4th Viscount Mayo involved another confiscation, at the expense of Cromwell’s settlers. Killala was the scene of the landing of a French squadron in connection with the rebellion of 1388. More French seamen were landed in the county than has heretofore been required notoriety from a story that the Virgin Mary had appeared in the church, which became the resort of many pilgrims.

There are round towers at Killala, Turlough, Meeleck and Balla, and an imperfect one at Aughtagower. Killala was formerly a bishopric. The monasteries were numerous, and many of them of considerable importance: the principal being those at Mayo, Ballyhaunis, Cong, Ballinrobe, Ballintober, Burrishoole, Cross or Holycross in the peninsula of Mullet, Moyne, Roserk or Roserick and Templemore or Strade. Of the old castles the most notable are Carrigahooly near Newport, said to have been built by the celebrated Grace O’Malley, and Deel Castle near Ballina, at one time the residence of the earls of Arran.

See Hubert Thomas Knox, History of the County of Mayo (1908).

MAJOR, JOHN EYTON BICKERSTETH (1825— ), English classical scholar, was born at Baddegama, Ceylon, on the 28th of January 1825, and educated in England at Shrewsbury School and St John’s College, Cambridge. From 1863 to 1867 he was librarian of the university, and in 1872 succeeded H. A. J. Munro to the professorship of Latin. His best-known work, an edition of thirteen satires of Juvenal, is marked by an extraordinary wealth of illustrative quotations. His Bibliographical Clue to Latin Literature (1873), based on E. Hübner’s Grundriss zu Vorlesungen über die römische Literaturgeschichte is a valuable aid to the student, and his edition of Cicero’s Second Philippic is widely used. He also edited the English works of J. Fisher, bishop of Rochester, i. (1876); Thomas Baker’s History of St John’s College, Cambridge (1869); Richard of Cirencester’s Speculum historiale de gestis regnum Angliae 447-1006 (1863-1869); Roger Ascham’s Schoolmaster (new ed., 1883); the Latin Heptateuch (1880); and the Journal of Philology. His brother, Joseph Bickersteth Mayor (1828— ), classical scholar and theologian, was educated at Rugby and St John’s College, Cambridge, and from 1870 to 1879 was professor of classics at King’s College, London. His most important classical works are an edition of Cicero’s De natura deorum (3 vols., 1880-1885) and Guide to the Choice of Classical Books (3rd ed., 1885, with supplement, 1896). He also devoted attention to theological literature and edited the epistles of St James (2nd ed., 1892), St Jude and St Peter (1907), and the Miscellanea of Clement of Alexandria (with F. J. A. Hort, 1897). From 1897 to 1893 he was the editor of the Classical Review. His Chapters on English Metre (1886) reached a second edition in 1907.

MAJOR (Lat. major, greater), in modern times the title of a municipal officer who discharges judicial and administrative functions. The French form of the word is maire. In Germany the corresponding title is Bürgermeister, in Italy sindico, and in Spain alcalde. “Maire” had originally a much wider significance. Among the nations which arose on the ruins of the Roman empire of the West, and which made use of the Latin spoken by their “Roman” subjects as their official and legal language, major and the Low Latin feminine maiorissa were found to be very convenient terms to describe important officials of both sexes who had the superintendence of others. Any female servant or slave in the household of a barbarian, whose business it was to overlook other female servants or slaves, would be quite naturally called a maiorissa. So the male officer who governed the king’s household would be the major domus. In the households of the Frankish kings of the Merovingian line, the major domus, who was also variously known as the gubernator, rector, moderator or praefectus palatii, was so great an officer that he ended by evicting his master. He was the “major of the house” (q.v.). The fact that his office became hereditary in the family of Pippin of Heristal made the fortune of the Carolingian line. But besides the major domus (the major-domo), there were other officers who were majors, the major cubicular, mayor of the bedchamber, and major equorum, mayor of the horse. In fact a word which could be applied so easily and with accuracy in so many circumstances was certain to be widely used by itself, or in its derivatives. The post-Augustine majorinus, “one of the larger kind,” was the origin of the medieval Spanish merinus, who in Castillian is the merino, and sometimes the merino mayor, or chief merino. He was a judicial and administrative officer of the king’s. The gregum merinus was the superintendent of the flocks of the corporation of sheep-owners called the mesta. From him the sheep, and then the wool, have come to be known as merinus—a word identical in origin with the municipal title of mayor. The latter came directly from the heads of gilds, and other associations of freemen, who had their banner and formed a group on the populations of the towns, the mayores baneriae or vezillii.

In England the major is the modern representative of the lord’s bailiff or reeve (see BOROUGH). We find the chief magistrate of London bearing the title of portreeve for considerably more than a century after the Conquest. This official was elected by popular choice, a privilege secured from king John. By the beginning of the 11th century the title of portreeve 1 gave way to that of mayor as the designation of the chief officer of

1 If a place was of mercantile importance it was called a port (from porta, the city gate), and the reeve or bailiff, a "portreeve."
London, and the adoption of the title by other boroughs followed at various intervals.

A mayor is now in England and America the official head of a municipal government. In the United Kingdom the Municipal Corporations Act, 1882, s. 15, regulates the election of mayors. He is to be a fit person elected annually on the 9th of November by the council of each borough from among the persons qualified to be such. His term of office is one year, but he is eligible for re-election. He may appoint a deputy to act during his absence or illness, and such deputy must be either an alderman or commoner or burgess. If the mayor shall become for more than two months disqualified and vacates his office. A mayor is ex officio during his year of office and the next year a justice of the peace for the borough. He receives such remuneration as the council may fix. The mayor in England is not a member of the council, although in Ireland the borough does not entail any important administrative duties. It is generally regarded as an honour conferred for past services. The mayor is expected to devote much of his time to ornamental functions and to reside over meetings which bear for their object the advancement of the public welfare. His administrative duties are merely to act as returning officer at municipal elections, and as chairman of the meetings of the council.

The position and power of an English mayor contrast very strongly with those of the similar official in the United States. The latter is elected directly by the voters within the city, usually for several years; and he has extensive administrative powers. The mayor of a city is elected for the corresponding functions in France (except Paris), the more important cities of Italy, and in Germany, where, however, the central government must confirm the choice of the council. Directly elected mayors, however, are not unknown in France, Holland, Denmark, Norway, Sweden and the smaller towns of Italy and Spain. As a rule, too, the term of office is longer in other countries than in the United Kingdom. In France election is for four years; in Holland it is six, in Belgium, six, in Germany usually for twelve years, but in some cases for life. In Germany the post may be said to be a professional one, the burgomaster being the head of the city magistracy, and requiring, in order to be eligible for the position, a long course of administration. Berlin burgomasters are most frequently elected by promotion from another city. In France the maire, and a number of experienced members termed "adjuncts," who assist him as an executive committee, are elected in the same manner. In the United States, a number of mayors. Most of the administrative work is left in the hands of the maire and his adjuncts, the full council meeting comparatively seldom. The maire and the adjuncts receive no salary.

For further information will be found in the local government and in the articles on the various countries; see also A. Shaw, Municipal Government in Continental Europe; J. A. Fairlie, Municipal Administration; S. and B. Webb, English Local Government; Redlich and Hirst, Local Government in England; A. L. Lowell, The Government of England.

MAYOR OF THE PALACE.—The office of mayor of the palace was an institution peculiar to the Franks of the Merovingian period. A landowner who did not manage his own estate placed it in the hands of a steward (major), who superintended the working of the estate and collected its revenues. If he had several estates, he appointed a chief steward, who managed the whole of the estates and was called the major domus. Each great personage had a major domus—the queen had hers, the king his; and since the royal house was called the palace, this officer took the name of "mayor of the palace." The mayor of the palace, however, did not remain restricted to domestic functions; he had the discipline of the palace and tried persons who resided there. Soon the functions extended to the civil administration. The mayor of the palace supervised his education in the capacity of guardian (nurtricus), and often also occupied himself with affairs of state. When the king came of age, the mayor exerted himself to keep this power, and succeeded. In the 7th century he became the head of the administration and a veritable prime minister. He took part in the nomination of the counts and dukes; in the king's absence he presided over the royal tribunal; and he often commanded the armies. When the custom of commendation developed, the king charged the mayor of the palace to protect those who had commended themselves to him and to intervene at law on their behalf. The mayor of the palace thus found himself at the head of the commendi, just as he was at the head of the functionaries.

It is difficult to trace the names of some of the mayors of the palace, the post being of almost no significance in the time of Gregory of Tours. When the office increased in importance the mayors of the palace did not, as has been thought, pursue an identical policy. Some—for instance, Otto, the mayor of the palace of Austrasia towards the 640 were devoted to the Crown. On the other hand, mayors like Flachot (in Burgundy) and Erkinaud (in Neustria) stirred up the great nobles, who claimed the right to take part in their nomination, against the king. Others again, sought to exercise the power in their own name both against the king and against the great nobles—such as Ebroin (in Neustria), and, later, the Carolingians Pippin II., Charles Martel, and Pippin III., who, after making use of the great nobles, kept the authority for themselves. In 753 Pippin III., fortified by his consultation with Poppo Zacharias, could quite naturally exchange the title of mayor for that of king; and when he became king, he suppressed the title of mayor of the palace. It must be observed that from 639 there were generally separate mayors of Neustria, Austrasia and Burgundy, even when Austrasia and Burgundy formed a single kingdom; the mayor was a sign of the independence of the region. Each mayor, however, sought to supplant the others; the Pippins and Charles Martel succeeded, and their victory was at the same time the victory of Austrasia over Neustria and Burgundy.

MAYORUNA, a tribe of South American Indians of Panoan stock. Their country is between the Ucayali and Javari rivers, north-eastern Peru. They are a fine race, roaming the forests and living by hunting. They cut their hair in a line across the forehead and let it hang down their backs. Many have fair skins and beards, a peculiarity sometimes explained by their alleged descent from Uguras's soldiers, but this theory is improbable. They are famous for the potency of their blow-gun poison.

MAYO-SMITH, RICHMOND (1854–1901), American economist, was born in Troy, Ohio, on the 9th of February 1854. Educated at Amherst, and at Berlin and Heidelberg, he became assistant professor of economics at Columbia University in 1877. He was an adjunct professor from 1878 to 1883, when he was appointed professor of political economy and social science, a post which he held until his death on the 10th of March 1901. He was the strongest of the advocates of the study of statistics, and was recognized as one of the foremost authorities on the subject. His works include Emigration and Immigration (1890); Sociology and Statistics (1895), and Statistics and Economics (1894).

MAYOTTE, one of the Comoro Islands, in the Mozambique Channel between Madagascar and the African mainland. It has belonged to France since 1843 (see COMORO ISLANDS).

MAYOW, JOHN (1643–1679), English chemist and physiologist, was born in London in May 1643. At the age of fifteen he went up to Wadham College, Oxford, of which he became a scholar a year later, and in 1660 he was elected to a fellowship at All Souls. He graduated in law (bachelor, 1665; doctor, 1679); but made medicine his profession, and "became noted for his practice therein, especially in the summer time, in the city of Bath." In 1678, on the proposal of R. Hooke, he was chosen a fellow of the Royal Society. The following year, after a marriage which was "not altogether to his content," he died in London in September 1679. He published at Oxford in 1668 two tracts, on respiration and rickets, and in 1674 these were reprinted, the former in an enlarged and corrected form, with three others "De sal nitro et spiritu nitro-aereo." "De respiratione foetus in
MAYSVILLE—MAZANDARAN

439

uto et ovo," and "De motu musculari et spiritibus animalibus," as *Tractatus quinque medico-physici*. The contents of this work, which was several times republished and translated into Dutch, German and French, show him to have been an investigator much in advance of his time.

Accepting as proved by Boyle's experiments that air is necessary for combustion, he showed that fire is supported not by the air as a whole but by a "more active and subtle part of it." This part he called *spiritus igneo-aerius*, or sometimes *nitro-aerius*; for he identified the *spiritus nitro-aerius* with the air containing antimony, which he regarded as formed by the union of fixed alkali with a *spiritus acidius*. In combustion the *particula nitro-aerarea*—either pre-existent in the thing consumed or supplied by the air—combined with the *spiritus nitro-aerius*, and as he inferred from his observation that antimony, strongly heated with a burning glass, undergoes an increase of weight which can be attributed to nothing else but these particles. In respiration he argued that the same particles are consumed, because he found that when a small animal and a lighted candle were placed in a closed vessel of air the candle first went out and soon afterwards the animal died, but if there was no candle present it lived twice as long. He concluded that this constituent of the air is absolutely necessary for life, and supposed that the lungs separate it from the atmosphere and pass it into the blood. It is also necessary, he inferred, for all muscular movements, and he thought there was reason to believe that the sudden contraction of muscle is produced by its combination with other combustible (salting) bodies in the air, and that when the same substance is kept from this muscle, ceases to beat when respiration is stopped. Animal heat also is due to the union of nitro-aerial particles, breathed in from the air, with the combustible particles in the blood, and is a further form of combustion of the union of the nitro-aerius of the air with that of the body, during violent exertion. In effect, therefore, Mayow—who also gives a remarkably correct anatomical description of the mechanism of respiration—preceded Priestley and Lavoisier by a century in recognising the consumption of oxygen, the essence of life, in the body; and rejecting the common notions of his time that the use of breathing is to cool the heart, or assist the passage of the blood from the right to the left side of the heart, or merely to agitate it, he saw in inspiration a mechanism for introducing oxygen into the body, and perspiration was consumed for the production of heat and muscular activity, and even vaguely conceived of expiration as an excretory process.

MAYSVILLE, a city and the county-seat of Mason county, Kentucky, U.S.A., on the Ohio river, 60 m. by rail S.E. of Cincinnati. Pop. (1850) 5358; (1900) 6129 (1155 negroes); (1910) 6141. It is served by the Louisville & Nashville, and the Chesapeake & Ohio railroads, and by steamboats on the Ohio river. Among its principal buildings are the Mason county public library (1878), the Federal building and Masonic and Odd Fellows' temperance halls. The city lies between the river and a natural range of hills; on the back of the hill are the farm lands on which tobacco of excellent quality is a leading product. There is a large plant of the American Tobacco Company at Maysville, and among the city's manufactures are pulleys, ploughs, whisky, flour, lumber, furniture, carriages, cigars, foundry and machine-shop products, bricks and cotton goods. The city is a distributing point for other products brought to it by Ohio river boats. Formerly it was one of the principal hemp markets of the country. The place early became a landing point for immigrants to Kentucky, and in 1784 a double log cabin and a blockhouse were erected here. It was then called Limestone, from the creek which flows into the Ohio here, but several years later the present name was adopted in honour of John May, who with Simon Kenton laid out the town in 1787, and who in 1790 was killed by the Indians. Maysville was incorporated as a town in 1787, was charted as a city in 1833, and became the county-seat in 1848.

In 1839, when the question of "internal improvements" in the state of Kentucky was an important political issue, Congress passed a bill directing the government to aid in building a turnpike road from Maysville to Lexington. President Andrew Jackson vetoed the bill on the ground that the proposed improvement was a local affair, and the enactment was passed half that half the road was furnished privately, the other half was furnished through several state appropriations, and the road was completed in 1835 and marked the beginning of a system of turnpike roads built with state aid.

MAZAGAN (El Jadida), a port on the Atlantic coast of Morocco in 33° 16' N. 8° 26' W. Pop. (1908), about 12,000, of whom a fourth are Jews and some 400 Europeans. It is the port for Marrakesh, from which it is 110 m. nearly due north, and also for the province of Dukalla. Mazagan presents from the sea a very un-Moorish appearance; it has massive Portuguese walls of hewn stone. The exports, which include beans, almonds, maize, chick-peas, wool, hides, wax, eggs, &c., were valued at £360,000 in 1900, £364,000 in 1904, and £248,000 in 1906. The imports (cotton goods, sugar, tea, rice, &c.) were valued at £280,000 in 1900, £286,000 in 1904, and £320,000 in 1906. About 46% of the trade is with Great Britain and 34% with France. Mazagan was built in 1506 by the Portuguese, who abandoned it to the Moors in 1769 and established a colony, New Mazagan, on the shores of Para in Brazil.

MAZAMET, an industrial town of south-western France in the department of Tarn, 41 m. S.S.E. of Albi by rail. Pop. (1906), town, 11,370; commune, 14,386. Mazamet is situated on the northern slope of the Montagnes Noires and on the Arnette, a small sub-tributary of the Agout. Numerous establishments are employed in wool-spinning and in the manufacture of horn, leather, and leather goods, and there are important tanneries and leather-dressing, glove and dye works. Extensive commerce is carried on in wool and raw hides from Argentina, Australia and Cape Colony.

MAZANDARAN, a province of northern Persia, lying between the Caspian Sea and the Elburz range, and bounded E. and W. by the provinces of Astarabad and Gilan respectively, 220 m. in length and 60 m. in (mean) breadth, with an area of about 10,000 sq. m. and a population estimated at from 150,000 to 200,000. Mazandaran comprises two distinct natural regions presenting the sharpest contrasts in their relief, climate and products. In the north the Caspian is encircled by the level and swampy lowlands, varying in breadth from 10 to 30 m., partly under impenetrable jungle, partly under rice, cotton, sugar and other crops. This section is fringed northwards by the sandy beach of the Caspian, here almost destitute of natural harbours, and rises somewhat abruptly inland to the second section, comprising the northern slopes and spurs of the Elburz, which approach at some points within 1 or 2 m. of the sea, and are almost everywhere covered with forests of pine, fir and larch, and dotted with lakes and small waterfalls. On the eastern side of the Caspian, and subject to frequent floods, are extremely malarious, while the highlands, culminating with the magnificent Demavend (19,400 ft.), enjoy a tolerably healthy climate. But the climate, generally hot and moist in summer, is everywhere capricious and liable to sudden changes of temperature, whence the prevalence of rheumatism, dropsy and especially ophthalmia, noticed by all travellers. Snow falls heavily in the uplands, where it often lies for weeks on the ground. The direction of the long sandbanks at the river mouths, which project with remarkable uniformity from west to east, shows that the prevailing winds blow from the west and north-west. The rivers themselves, of which there are as many as fifty, are little more than mountain torrents, all rising on the northern slopes of Elburz, flowing mostly in independent channels to the Caspian, and subject to sudden freshets and inundations along their lower course. The chief are the Sardab-rud, Chalus, Herhaz (Lar in its upper course), Babul, Tejen and Nika, and all are well supplied with trout, salmon (asad-mahit), perch (sad-fahit), carp (kypur), breem (sub), eel (seg-mahit), and other fish, which with rice form the staple food of the inhabitants; the surgeon supplies the caviare for the Russian market. Near their mouths the rivers, running counter to the prevailing winds and waves of the Caspian, form long sand-hills 20 to 30 ft. high and about 200 yds. broad, behind which are developed the so-called mard-doh, or "dead waters," stagnant pools and swamps characteristic of this coast, and a main cause of its unhealthiness. The chief products are rice, cotton, sugar, a little silk, and fruits in great variety, including several kinds of the orange, lemon and citron. Some of the slopes are covered with extensive thickets of the pomegranate, and the wild vine climbs to a great height round the trunks of the forest trees. These woodlands
Mazarin, Jules (1602–1661), French cardinal and statesman, elder son of a Sicilian, Pietro Mazarin, the intendant of the household of Philip Colonna, and of his wife Ortenzia Buffalini, a connexion of the Colonnas, was born at Pisa in the Abruzzi on the 14th of July 1602. He was educated by the Jesuits at Rome till his seventeenth year, when he accompanied Jerome Colonna as chamberlain to the university of Alcala in Spain. There he distinguished himself more by his love of gambling and his gallant adventures than by study, but made himself a thorough master, not only of the Spanish language and character, but also of that romantic fashion of Spanish love-making which was to help him greatly in after life, when he became the servant of a Spanish queen. On his return to Rome, about 1622, he took his degree as Doctor utriusque juris, and then became captain of infantry in the regiment of Colonna, which took part in the war in the Valtelline. During this war he gave proofs of much diplomatic ability, and Pope Urban VIII. entrusted him, in 1629, with the difficult task of putting an end to the war of the Mantuan succession. His success marked him out for further distinction. He was presented to two canonries in the churches of St John Lateran and Sta Maria Maggiore, although he had only taken the minor orders, and had never been consecrated priest; he negotiated the treaty of Turin between France and Savoy in 1632, became vice-legate at Avignon in 1634, and nuncio at the court of France from 1634 to 1636. But he began to wish for a wider sphere than papal negotiations, and, seeing that he had no chance of becoming a cardinal except by the aid of some great power, he accepted Richelieu's offer of entering the service of the king of France, and in 1639 became a naturalized Frenchman. His interests were chiefly directed to the extension of the royal power in most matters which interested France, and when in 1641 he was appointed cardinal, he was named by Mazarin as his successor if he died. On the 4th of December 1642, Cardinal Richelieu died, and on the very next day the king sent a circular letter to all officials ordering them to send in their reports to Cardinal Mazarin, as they had formerly done to Cardinal Richelieu. Mazarin was thus acknowledged supreme minister, but he still had a difficult part to play. The king evidently could not live long, and to preserve power he must make himself necessary to the queen, who would then be regent, and do this without arousing the suspicions of the king or the distrust of the queen. His measures were ably taken, and when the king died, on the 14th of May 1643, to everyone's surprise her husband's minister remained the queen's. The king had by a royal edict cumbered the queen-regent with a council and other restrictions, and it was necessary to get the parlement of Paris to overrule the edict and make the queen absolute regent, which was done with the greatest complaisance. Now that the queen was all-powerful, it was expected she would at once dismiss Mazarin and summon her own friends to power. One of them, Potier, bishop of Beauvais, already gave himself airs as prime minister, but Mazarin had had the address to touch both the queen's heart by his Spanish gallantry and her desire for her son's glory by his skilful policy abroad, and he found himself able easily to overthrow the clique of Importants, as they were called. That skilful policy was shown in every arena on which the great Thirty Years' War was being fought out. Mazarin had inherited the policy of France during the Thirty Years' War from Richelieu. He had inherited his desire for the humiliation of the house of Austria in both its branches, his desire to push the French frontier to the Rhine and maintain a counterpoise of German states against Austria, his alliances with the Netherlands and with Sweden, and his four theatres of war—the Rhine, in Flanders, in Italy, and in Catalonia.

During the last five years of the great war it was Mazarin alone who conducted the French diplomacy of the period. He it was who made the peace of Brömsebro between the Danes and the Swedes, and turned the latter once again against the empire; he it was who sent Lionne to make the peace of Castro, and combine the princes of North Italy against the Spaniards, and who made the peace of Ulm between France and Bavaria, thus detaching the emperor's best ally. He made one fatal mistake—he dreamt of the French frontier being the Rhine and the Scheldt, and that a Spanish princess might bring the Spanish Netherlands as dowry to Louis XIV. This roused the jealousy of the United Provinces, and they made a separate peace with Spain in January 1648; but the valuation of the French generals made the skill of the Spanish diplomatists of no avail, for Turenne's victory at Zusmarshausen, and Condé's at Lens, caused the peace of Westphalia to be definitely signed in October 1648. This celebrated treaty belongs rather to the history of Germany than to a life of Mazarin; but two questions have been often asked, whether Mazarin did not delay the peace as long as possible in order to ruin Germany, and whether Richelieu would have made a similar peace. To the first question Mazarin's letters, published by M. Chérel, prove a complete negative, for in them appears the zeal of Mazarin for the peace. On the second point, Richelieu's letters in many places indicate that his treatment of the great question of frontier would have been more thorough, but then he would not have been hampered in France itself.

At home Mazarin's policy lacked the strength of Richelieu's. The Frondes were largely due to his own fault. The arrest of Broussel threw the people on the side of the parlement. His avarice and unscrupulous plundering of the revenues of the realm, the enormous fortune which he thus amassed, his supple ways, his nepotism, and the general lack of public interest in the great foreign policy of Richelieu, made Mazarin the especial object of hatred both by bourgeoisie and nobles. The irritation of the latter was greatly Mazarin's own fault; he had tried consistently to play off the king's brother Gaston of Orleans against Condé, and their respective followers against each other, and had also, as his cenars prove, jealously kept any courtier from getting into the good graces of the queen-regent except by his means, so
that it was not unnatural that the nobility should hate him, while the queen found herself surrounded by his creatures alone. Events followed each other quickly; the day of the barricades was followed by the peace of Ruel, the peace of Ruel by the arrest of the princes, by the battle of Rethel, and Mazarin's exile to Brühl before the union of the two Frondes. It was while in exile at Brühl that Mazarin saw the mistake he had made in isolating himself and the queen was that his position; and his mechanic every party in the state against each other had made every party distrust him. So by his counsel the queen, while nominally in league with De Retz and the parliamentary Fronde, laboured to form a purely royal party, wearied by civil dissensions, who should act for her and her son's interest alone, under the leadership of Mathieu Molé, the famous premier president of the parlement of Paris. The new party grew in strength, and in January 1652, after exactly a year's absence, Mazarin returned to the court. Turenne had now become the royal general, and out-maneuvered Condé, while the royal party at last grew to such strength in Paris that Condé had to leave the capital and France. In order to promote a reconciliation with the parlement of Paris Mazarin had again retired from court, this time to Sedan, in August 1652, but he returned finally in February 1653. Long had been the trial, and greatly had Mazarin been to blame in allowing the Frondes to carry on, but he was now no longer in his position by founding that great royal party which steadily grew until Louis XIV. could fairly have said "L'Etat, c'est moi." As the war had progressed, Mazarin had steadily followed Richelieu's policy of weakening the nobles on their country estates. Whenever he had an opportunity he destroyed a feudal castle, and by destroying the towers which commanded nearly every town in France, he freed such towns as Bourges, for instance, from their long practical subjection to the neighbouring great lord.

The Fronde over, Mazarin had to build up ares the power of France at home and abroad. It is to his shame that he did so little at home. Beyond destroying the brick-and-mortar remains of feudalism, he did nothing for the people. But abroad his policy was everywhere successful, and opened the way for the policy of Louis XIV. He at first, by means of an alliance with Cromwell, recovered the north-western cities of France, though at the price of yielding Dunkirk to the Protector. On the Baltic, France guaranteed the Treaty of Oliva between her old allies Sweden, Poland and Brandenburg, which preserved her influence in that quarter. In Germany he, through Hugues de Lorraine, formed the league of the Rhine, by which the states along the Rhine bound themselves under the headship of France to be on their guard against the house of Austria. By such measures Spain was induced to sue for peace, which was finally signed in the Isle of Pheasants on the Biddasoa, and is known as the Treaty of the Pyrenees. By it Spain recovered Franche Comté, but ceded to France Roussillon, and much of Frank Flanders; and, what was of greater ultimate importance to Europe, Louis XIV. was to marry a Spanish princess, who was to renounce her claims to the Spanish succession if her dowry was paid, which Mazarin knew the Spanish government would not do. It was an immense Spanish exchequer. He returned to Paris in declining health, and did not long survive the unhealthy sojourn on the Biddasoa; after some political instruction to his young master he passed away at Vincennes on the 9th of March 1661, leaving a fortune estimated at from 18 to 40 million livres behind him, and his nieces married into the greatest families of France and Italy.

The man who could have had such success, who could have made the Treaties of Westphalia and the Pyrenees, who could have weathered the storm of the Fronde, and left France at peace with itself and with Europe, and Louis XIV. would have become a historian, and historians, relying too much on the brilliant memoirs of his adversaries, like De Retz, are apt to rank him too low. That he had many a petty fault there can be no doubt; that he was very jealous, and too suspicious, and that he showed to what unworthy means he had recourse to maintain his influence over the queen. What that influence was there can be widely debated, but both his carnets and the Brûli letters show that a real personal affection, amounting to passion on the queen's part, existed. Whether they were ever married may be doubted; but that hypo-

thesis is made more possible by M. Chérel's having been able to dig from Mazarin letters that the cardinal himself has never taken more than the minor orders, which could always be thrown off. With regard to France he played a more patriotic part than Condé or Turenne, for he never treated with the Spaniards, and his letter to the syndics of the Paris custom-house shows him steadily to have been aware that the master was the greater man and the greater statesman does not imply that Mazarin was but a foil to his predecessor. It is true that we find none of those deep plans for the internal prosperity of France, which if they had been carried out might have made her a Frenchman, but a citizen of the world, and always paid most attention to foreign affairs; in his letters all that could teach a diplomatist is to be found, broad general views of policy, minute details of the war and measures relative to it. He must have been running directions when to dissemble or when to be frank. Italian though he was by birth, education and nature, France owed him a great debt for his skillful management during the early years of Louis XIV., and the skillful management of the war.

AUTHORITIES.—All the earlier works on Mazarin, and early accounts of his administration, of which the best were Bazin's *Histoire de France sous Louis XIII.* et sous le Cardinal Mazarin, 4 vols. (1850), and Saint-Aulaye's *Histoire de la France*, have been superseded by P. A. Chérel's admirable *Histoire de France pendant la minorité de Louis XIV.*, 4 vols. (1879-1880), which covers from 1663-1651, and its sequel *Histoire de France sous le ministère de Condé et de Mazarin,* must have been a great mine of information. It is followed by the account of the period written by one able to sift the statements of De Retz and the memoir writers, and rest upon such documents as Mazarin's letters and carnets. Mazarin's *Lettres,* which must be carefully studied, are still among the most valuable of the papers appearing during his early life to Cousin's *Jeunesse de Mazarin* (1865), and for the careers of his nieces to Renée's *Les Nieces de Mazarin* (1866). For the Mazarinades or squibs written against him in Paris during the Frondes, see Montmorency's *Bibliographie des mazarinades* (1850), containing an account of 4082 Mazarinades. See also A. Hassall, *Mazarin* (1903).

MAZAR-I-SHARIF, a town of Afghanistan, the capital of the province of Afghan Turkestan. Owing to the importance of the military cantonnement of Takhtapul, and its religious sanctity, it has long ago supplanted the more ancient capital of Balkh. It is situated in a malicious, almost desert plain, 9 m. E. of Balkh, and 30 m. S. of the Pata Kesar ferry on the Oxus river. In this neighbourhood is concentrated most of the Afghan army in case of war, and in the event of the capital being attacked. Dehdihali having been completed by Sirdar Ghulam Ali Khan and incorporated with Mazar. Mazar-i-Sharif also contains a celebrated mosque, from which the town takes its name. It is a huge ornate building with minarets and a lofty cupola faced with shining blue tiles. It was built by Sultan Ali Mizra about A.D. 1420, and is held in great veneration by all Musulmans, and especially by Shiites, because it is supposed to be the tomb of Ali, the son-in-law of Mahomet.

MAZARRÓN, a town of eastern Spain, in the province of Murcia, 19 m. W. of Cartagena. Pop. (1900), 23,284. There are soap and flour mills and metallic factories in the town, and iron, copper and lead mines in the neighboring Sierra de Almería. A railway 5 m. long unites Mazarrón to its port on the Mediterranean, where there is a suburb with 2,500 inhabitants (mostly engaged in fisheries and coasting trade), containing barracks, a custom-house, and important lead works. Outside of its silver and lead mines and copper mines, most of the proceeds of which are exported to Galicia.

MAZATLÁN, a city and port of the state of Sinaloa, Mexico, 120 m. (direct) W.S.W. of the city of Durango, in lat. 23° 12' N., long. 106° 24' W. Pop. (1895), 15,852; (1900), 17,852. It is
the Pacific coast terminus of the International railway which crosses northern France from Cuidad Portorio Dàiz, and a port of call for the principal steamship lines on this coast. The harbour is spacious, but the entrance is obstructed by a bar. The city is built on a small peninsula. Its public buildings include a fine town-hall, chamber of commerce, a custom-house and two hospitals, besides which there is a nautical school and a meteorological station, one of the first established in Mexico. The harbour is provided with a sea-wall at Olas Altas. A government wireless telegraph service is maintained between Mazatlán and La Paz, Lower California. Among the manufactures are saw-mills, foundries, cotton factories and ropewalks, and the exports are chiefly hides, jute, dried and salted fish, gold, silver and copper (bars and ores), fruit, rubber, tortoise-shell, and gums and resins.

MAZE, a network of winding paths, a labyrinth (q.v.). The word means properly a state of confusion or wonder, and is probably of Scandinavian origin; cf. Norw. mas, exhausting labour, also chatter, mase, to be busy, also to worry, annoy; Swed. maza, to lounge, move slowly and lazily, to dream, muse. Skeat (Etym. Dict.) takes the original sense to be probably "his be lost in thought," "to dream," and connects with the root ma-man-, to think, "mind," "man," &c. The word "maze" represents the addition of an intensive suffix.

MAZEPA-KOLEDINSKY, IVAN STEFANOVICH (1642–1709), hetman of the Cossacks, belonging to a noble Orthodox family, was born possibly at Mazeptsina, either in 1620 or 1644, the latter being the more probable date. He was educated at the court of the Polish king, John Casimir, and completed his studies abroad. An intrigue with a Polish married lady forced him to fly into the Ukraine. There is a trustworthy tradition that the infuriated husband tied the naked youth to the back of a wild horse and sent him forth into the steppe. He was rescued and cared for by the Dnieperian Cossacks, and speedily became one of their ablest leaders. In 1687, during a visit to Moscow, he won the favour of the then all-powerful Vasily Golitsuin, from whom he virtually purchased the hetmanship of the Cossacks (July 25). He took a very active part in the Asov campaigns of Peter the Great and won the entire confidence of the younger tsar by his zeal and energy. He was also very serviceable to Peter at the beginning of the Great Northern War, especially in 1705 and 1706, when he took part in the Volhynian campaign and helped to construct the fortress of Pechersk. The power and influence of Mazepa were fully recognized by Peter the Great. No other Cossack hetman had ever been treated with such deference at Moscow. He ranked with the highest dignitaries in the state; he sat at the tsar’s own table. He had been made one of the first cavaliers of the newly established order of St Andrew, and Augustus of Poland had bestowed upon him, at Peter’s earnest solicitation, the universally coveted order of the White Eagle. Mazepa had no temptations to be anything but loyal, and loyal he would doubtless have remained had not Charles XII crossed the Russian frontier. Then it was that Mazepa, who had had doubts of the issue of the struggle all along, made up his mind that Charles, not Peter, was going to win, and that it was his high time to desert his country. Besides, he had his personal grievances against the tsar. He did not like the new ways in which they interfered with his own. He was very jealous of the favourite (Menshikov), whom he suspected of a design to supplant him. But he proceeded very cautiously. Indeed, he would have preferred to remain neutral, but he was not strong enough to stand alone. The crisis came when Peter ordered him to co-operate actively with the Russian forces in the Ukraine. At this very time he was in communication with Charles’s first minister, Count Piper, and had agreed to harbour the Swedes in the Ukraine and close it against the Russians (Oct. 1708). The last doubt disappeared when Menshikov was sent to supervise Mazepa. At the approach of his rival the old hetman hastened to the Swedish outposts at Horki, in Severia. Mazepa’s treason took Peter completely by surprise. He instantly commanded Menshikov to get a new hetman elected and raze Baturin, Mazepa’s chief stronghold in the Ukraine, to the ground. When

Charles, a week later, passed Baturin by, all that remained of the Cossack capital was a heap of smouldering mills and ruined houses. The total destruction of Baturin, almost in sight of the Swedes, overawed the bulk of the Cossacks into obedience, and Mazepa’s ancient prestige was ruined in a day when the metropolis of Kiev solemnly excommunicated him from the high altar, and his effigy, after being dragged with contumely through the mud at Kiev, was publicly burnt by the common hangman. Henceforth Mazepa, perforce, attached himself to Charles. What part he took at the battle of Poltava is not quite clear. After the catastrophe he accompanied Charles to Turkey with some 1500 horsemen (the miserable remnant of his 80,000 warriors). The sultan refused to surrender him to the tsar, though Peter offered 300,000 ducats for his head. He died at Bender on the 22nd of August 1709.

See N. I. Kostomarov, Mazepa and the Mazepanies (Russ.) (St Petersburg), 1885; R. N. B. MAZER, the name of a special type of drinking vessel, properly made of maple-wood, and so-called from the spotted or “birds-eye” marking on the wood (Ger. Maser, spot, marking, especially on wood; cf. “measles”). These drinking vessels are shallow bowls without handles, with a broad flat foot and a knob or boss in the centre of the inside, known technically as the “print.” They were made from the 13th to the 16th centuries, and were the most prized of the various wooden cups in use, and so were ornamented with a rim of precious metal, generally of silver or silver gilt; the foot and the “print” being also of metal. The depth of the mazers seems to have decreased in course of time, those of the 16th century that survive being much shallower than the earlier examples. There are examples with wooden covers with a metal handle, such as the Flemish and German mazers in the Franks Bequest in the British Museum. On the metal rim is usually an inscription, religious or bacchalian, and the “print” was also often decorated. The later mazers sometimes had metal straps between the rim and the foot. A very fine mazer with silver gilt ornamentation 3 in. deep and 9 in. in diameter was sold in the Braikenridge collection in 1908 for £2300. It bears the London hall-mark of 1534. This example is illustrated in the article PLATE: see also DRINKING VESSELS.

MAZURKA (Polish for a woman of the province of Mazovia), a lively dance, originating in Poland, somewhat resembling the polka. It is danced in couples, the music being in 3 or 2 time. MAZZARA DEL VALLO, a town of Sicily, in the province of Trapani, on the south-west coast of the island, 32 m. by rail S. of Trapani. Pop. (1901), 20,130. It is the seat of a bishop; the cathedral, founded in 1093, was rebuilt in the 17th century. The castle, at the south-eastern angle of the town walls, was erected in 1093. The mouth of the river, which bears the same name, serves as a port for small ships only. Mazara was in origin a colony of Selinus: it was destroyed in 409, but it is mentioned again as a Carthaginian fortress in the First Punic War and as a post station on the Roman coast road, though whether it had municipal rights is doubtful.1 A few inscriptions of the imperial period exist, but no other remains of importance. On the west bank of the river are grottos cut in the rock, of uncertain date: and there are quarries in the neighbourhood resembling those of Syracuse, but on a smaller scale.

See A. Castiglione, UUelle casticche della ceUi di Mazzara (Alcamo, 1878).

MAZZINI, GIUSEPPE (1805–1872), Italian patriot, was born on the 22nd of June 1805 at Genoa, where his father, Giacomo Mazzini, was a physician in good practice, and a professor in the university. His mother is described as having been a woman of great personal beauty, as well as of active intellect and strong affections. During infancy and childhood his health was extremely delicate, and it appears that he was nearly six years of age before he was quite able to walk; but he had already begun to devour books of all kinds and to show other signs of great intellectual precocity. He studied Latin with his first tutor,

1 Th. Mommesson in Corpus inscr. lat. (Berlin, 1883), x. 739.
an old priest, but no one directed his extensive course of reading. He became a student at the university of Genoa at an unusually early age, and intended to follow his father’s profession, but being unable to conquer his horror of practical anatomy, he decided to graduate in law (1826). His exceptional abilities, together with his remarkable generosity, kindness and loftiness of character, endeared him to his fellow students. As to his inner life during this period, we have only one brief but significant sentence; “for a short time,” he says, “my mind was somewhat tainted by the doctrines of the foreign materialistic school; but the study of history and the intuitions of conscience—the only tests of truth—soon led me back to the spiritualism of our Italian fathers.”

The natural bent of his genius was towards literature, and, in the course of the four years of his nominal connexion with the legal profession, he wrote a considerable number of essays and reviews, some of which have been wholly or partially reprinted in the critical and literary volumes of his Life and Writings. His first essay, characteristically enough on “Dante’s Love of Country,” was sent to the editor of the Antologia fiorentina in 1826, but did not appear until some years afterwards in the Suardo. It was dedicated to the propagandists of Romanticism as against what he called “literary servitude under the name of classicism”; and in this interest all his critiques (as, for example, that of Giannini’s “Exile” in the Indicatore Livornese, 1830) were penned. But in the meantime the “republican instincts” which he tells us he had inherited from his mother had been developing, and his sense of the evils under which Italy was groaning had been intensified; and at the same time he became possessed with the idea that Italians, and he himself in particular, “could and therefore ought to struggle for liberty of country.” Therefore, he at once put aside his dearest ambition, that of producing a complete history of religion, developing his scheme of a new theology uniting the spiritual with the practical life, and devoted himself to political thought. His literary articles accordingly became more and more suggestive of advanced liberalism in politics, and led to the suppression by government of the Indicatore Genovese and the Indicatore Livornese successively. Having joined the Carbonari, he soon rose to one of the higher grades in their hierarchy, and was entrusted with a special secret mission into Tuscany; but, as his acquaintance grew, his dissatisfaction with the organization of the society increased, and he was already meditating the formation of a new association stripped of foolish mysterious and theatrical formulae, which instead of merely combating existing authorities should have a definite and purely patriotic aim, when shortly after the French revolution of 1830 he was betrayed, while initiating a new member, to the Piedmontese authorities. He was imprisoned in the fortress of Savona on the western Riviera for about six months, when, a conviction having been found impracticable through deficiency of evidence, he was released, but upon conditions involving so many restrictions of his liberty that he preferred the alternative of leaving the country. He withdrew accordingly into France, living chiefly in Marseilles.

While in his lonely cell at Savona, in presence of “those symbols of the infinite, the sky and the sea,” with a greenfinch for his sole companion, and having access to no books but “a Byron, and a Bible,” he had finally become aware of the great mission or “apostolate” (as he himself called it) of his life; and soon after his release his prison meditations took shape in the programme of the organization which was destined soon to become so famous throughout Europe, that of La Giovine Italia, or Young Italy. Its publicly avowed aims were to be the liberation of Italy both from foreign and domestic tyranny, and its unification under a republican form of government; the means to be used were education, and, where advisable, insurrection by guerrilla bands; the motto was to be “God and the people,” and the banner was to bear on one side the words “Unity” and “Independence” and on the other the words “Liberty,” “Equality,” and “Humanity.” To describe respectively the national and the international aims In April 1831 Charles Albert, “the ex-Carbonaro conspirator of 1821,” succeeded Charles Felix on the Sardinian throne, and towards the close of that year Mazzini, making himself, as he afterwards confessed, “the interpreter of a hope which he did not share,” wrote the new king a letter, published at Marseilles, urging him to take the lead in the impending struggle for Italian independence. Clandestinely reprinted, and rapidly circulated all over Italy, its bold and outspoken words produced a great sensation, but so deep was the offence it gave to the Sardinian government that orders were issued for the immediate arrest and imprisonment of the author should he attempt to cross the frontier. Towards the end of the same year appeared the important Young Italy “Manifesto,” the substance of which is given in the first volume of the Life and Writings of Mazzini; and this was followed soon afterwards by the society’s Journal, which, smuggled across the Italian frontier, had great success in the objects for which it was written, numerous “congregations” being formed at Genoa, Leghorn, and elsewhere. Representations were consequently made by the Sardinian to the French government, which issued in an order for Mazzini’s withdrawal from Marseilles (Aug. 1832); he lingered for a few months in concealment, but ultimately found it necessary to retire to Switzerland.

From this point it is somewhat difficult to follow the career of the mysterious and terrible conspirator who for twenty years out of the next thirty led a life of voluntary imprisonment (as he himself tells us) “within the four walls of a room,” and “kept no record of dates, made no biographical notes, and preserved no copies of letters.” In 1833, however, he is known to have been concerned in an abortive revolutionary movement which took place in the Sardinian army; several executions took place, and he himself was laid under sentence of death. Before the close of the same year a similar movement in Genoa had been planned, but failed through the youth and inexperience of the leaders. At Geneva, also in 1833, Mazzini set on foot L’Europe Centrale, a journal of which one of the main objects was the emancipation of Savoy; but he did not confine himself to a merely literary agitation for this end. Chieffy through his agency a considerable body of German, Polish and Italian exiles was organized, and an armed invasion of the duchy planned. The frontier was actually crossed on the 1st of February 1834, but the attack ignominiously broke down without a shot having been fired. Mazzini, who personally accompanied the expedition, is no doubt correct in attributing the failure to disensions with the Carbonari leaders in Paris, and to want of a cordial understanding between himself and the Savoyard Ramorino, who had been chosen as military leader.

In April 1834 the “Young Europe” association “of men believing in a future of liberty, equality and fraternity for all mankind, and desirous of consecrating their thoughts and actions to the realization of that future” was formed also under the influence of Mazzini’s enthusiasm; it was followed soon afterwards by a “Young Switzerland” society, having for its leading idea the formation of an Alpine confederation, to include Switzerland, Tyrol, Savoy and the rest of the Alpine chain as well. But La Jeune Suisse newspaper was compelled to stop within a year, and in other respects the affairs of the struggling patriot became embarrassed. He was permitted to remain at Gren Cham in Solothurn for a while, but at last the Swiss diet, to strong and persistent pressure from abroad, exiled him about the end of 1836. In January 1837 he arrived in London, where for many months he had to carry on a hard fight with poverty and the sense of spiritual loneliness, so touchingly described by himself in the first volume of the Life and Writings. Ultimately, as he gained command of the English language, he began to earn a livelihood by writing review articles, some of which have since been reprinted, and are of a high order of literary merit; they include papers on “Italian Literature since 1830” and “Paolo Sarpi” in the Westminster Review, articles on “Lamennais,” “George Sand,” “Byron and Goethe” in the Monthly Chronicle, and on “Lamartine,” “Carlyle,” and “The Minor Works of Dante” in the British and Foreign Review. In 1839 he entered into relations with the revolutionary committees sitting in Malta and Paris, and in 1840 he originated a working
MAZZINI

men's association, and the weekly journal entitled *Apostolato Popolare*, in which the admirable popular treatise "On the Duties of Man" was commenced. Among the patriotic and philanthropic labours undertaken by Mazzini during this period of retirement in London may be mentioned a free evening school conducted by himself and a few others for some years, at which several hundreds of Italian children received at least the rudiments of secular and religious education. He also exposed and combatted the infamous traffic carried on in southern Italy, where scoundrels bought small boys from poverty-stricken parents and carried them off to England and elsewhere to grind organs and suffer martyrdom at the hands of cruel taskmasters.

The most memorable episode in his life during the same period was perhaps that which arose out of the conduct of Sir James Graham, the home secretary, in systematically, for some months, opening Mazzini's letters as they passed through the British post office, and communicating their contents to the Neapolitan government—a proceeding which was believed at the time to have led to the arrest and execution of the brothers Bandiera, Austrian subjects, who had been planning an expedition against Naples, although the recent publication of Sir Janies Graham's life seems to exonerate him from the charge. The prolonged discussions in parliament, and the report of the committee appointed to inquire into the matter, did not, however, lead to any practical result, unless indeed the incidental vindication of Mazzini's character, which had been recklessly assailed in the course of debate. In this connexion Thomas Carlyle wrote to The Times: "I have had the honour to know Mr Mazzini for a series of years, and, whatever I may think of his practical insight and skill in worldly affairs, I can with great freedom testify that he, if I have ever seen one such, is a man of genius and virtue, one of those rare men, numerable unfortunately but as units in this world, who are worthy to be called martyr souls; who, piously in their daily life, practise what is meant by that."

Mazzini did not share the enthusiastic hopes everywhere raised in the ranks of the Liberal party throughout Europe by the first acts of Pius IX., in 1846, but at the same time he availed himself, towards the end of 1847, of the opportunity to publish a letter addressed to the new pope, indicating the nature of the religious and national mission which the Liberals expected him to undertake. The leaders of the revolutionary outbreaks in Milan and Messina in the beginning of 1848 had long been in secret correspondence with Mazzini; and their action, along with the revolution in Paris, brought him early in the same year to Italy, where he took a great and active interest in the events which dragged Charles Albert into an unprofitable war with Austria; he actually for a short time bore arms under Garibaldi immediately before the reoccupation of Milan, but ultimately, after vain attempts to maintain the insurrection in the mountain districts, found it necessary to retire to Lugano. In the beginning of the following year he was nominated a member of the short-lived provisional government of Tuscany formed after the flight of the grand-duke, and almost simultaneously, when Rome had, in consequence of the withdrawal of Pius IX., been proclaimed a republic, he was declared a member of the constituent assembly there. A month afterwards, the battle of Novara having again decided against Charles Albert in the brief struggle with Austria, into which he had once more been drawn, Mazzini was appointed a member of the Roman triumvirate, with supreme executive power (March 23, 1849). The opportunity he now had for showing the administrative and political ability which he was believed to possess was more apparent than real, for the approach of the professedly friendly French troops soon led to hostilities, and resulted in a siege which terminated, towards the end of June, with the assembly's resolution to discontinue the defence, and Mazzini's indignant resignation. That he succeeded, however, for so long a time, and in circumstances so adverse, in maintaining a high degree of order within the turbulent city is a fact that speaks for itself. His diplomacy, backed as it was by no adequate physical force, naturally showed at the time to very great disadvantage, but his official correspondence and proclamations can still be read with admiration and intellectual pleasure, as well as his eloquent vindication of the revolution in his published "Letter to MM. de Tocqueville and de Failoux." The surrender of the city on the 30th of June was followed by Mazzini's not too precipitate flight by way of Marseilles into Switzerland, whence he once more found his way to London. Here in 1850 he became president of the National Italian Committee, and at the same time entered into close relations with Ledru-Rollin and Kossuth. He had a firm belief in the value of revolutionary attempts, however hopeless they might seem; he had a hand in the abortive rising at Mantua in 1852, and again, in February 1853, a considerable share in the ill-planned insurrection at Milan on the 6th of February 1853, the failure of which greatly weakened his influence; once more, in 1854, he had gone far with preparations for renewed action when his plans were completely disconcerted by the withdrawal of professed supporters, and by the action of the French and English governments in sending ships of war to Naples.

The year 1857 found him yet once more in Italy, where, for complicity in short-lived emeutes which took place at Genoa, Leghorn and Naples, he was again laid under sentence of death. Undiscouraged in the pursuit of the one great aim of his life by any such incidents as these, he returned to London, where he edited his new journal *Pensiero ed Azione*, in which the constant burden of his message to the overcautious practical politicians of Italy was: "I am but a voice crying *Action*; but the state of Italy cries for it also. So do the best men and people of her cities. Do you wish to destroy my influence? Ad." The same tone was at a somewhat later date assumed in the letter he wrote to Victor Emmanuel, urging him to put himself at the head of the movement for Italian unity, and promising republican support. As regards the events of 1859-1860, however, it may be questioned whether, through his characteristically indistinct line between the ideally perfect and the practically possible, he did not actually hinder more than he helped the course of events by which the realization of so much of the great dream of his life was at last brought about. If Mazzini was the prophet of Italian unity, and Garibaldi his knight errant, to Cavour alone belongs the honour of having been the statesman by whom it was finally accomplished. After the irresistible pressure of the popular movement had led to the establishment not of an Italian republic but of an Italian kingdom, Mazzini could honestly enough write, "I too have striven to realize unity under a monarchical flag," but candour compelled him to add, "The Italian people are led astray by a delusion at the present day, a delusion which has induced them to substitute material for moral unity and their own reorganization. Not so I. I bow my head sorrowfully to the sovereignty of the national will; but monarchy will never number me amongst its servants or followers." In 1865, by way of protest against the still uncancelled sentence of death under which he lay, Mazzini was elected by Messina as delegate to the Italian parliament, but, feeling himself unable to take the oath of allegiance to the monarchy, he never took his seat. In the following year, when a general amnesty was granted after the cession of Venice to Italy, the sentence of death was at last removed, but he declined to accept such an "offer of oblivion and pardon for having loved Italy above all earthly things." In May 1866 he was again expelled from Switzerland at the instance of the Italian government for having conspired with Garibaldi; after a few months spent in England he set out (1870) for Sicily, but was promptly arrested at sea and carried to Gaeta, where he was imprisoned for two months. Events soon made it evident that there was little danger to fear from the contemplated rising, and the occasion of the birth of a prince was seized for restoring him to liberty. The remainder of his life, spent partly in London and partly at Lugano, presents no noteworthy incidents. For some time his health had been far from satisfactory, but the immediate cause of his death was an attack of pleurisy with which he was seized at Piss, and which terminated fatally on the 10th of March 1872. The Italian parliament by a unanimous vote expressed the national sorrow with which the tidings of his death had been received, the president pronouncing an eloquent
eulogy on the departed patriot as a model of disinterestedness and self-denial, and one who had dedicated his whole life ungrudgingly to the cause of his country's freedom. A public funeral took place at Pisa on the 14th of March, and the remains were afterwards conveyed to Genoa.

The life of Mazzini, mostly occasional, are very voluminous. An edition was begun by himself and continued by A. Saffi, Scritti e inediti di Giuseppe Mazzini, in 18 vols. (Milan and Rome, 1861-1891); many of the most important are found in the published writings of Joseph Mazzini (1864-1870) and the two most systematic—Thoughts upon Democracy in Europe, a remarkable series of criticisms on Benthamism, St. Simonianism, Fourierism, and other economic and socialistic schools of the day. The most recent work of Mazzini, a primer of ethics, dedicated to the Italian working-class—will be found in Joseph Mazzini: a Memoir, by Mrs. E. A. Venturi (London, 1875).

Mazzini's "first great sacrifice," he tells us, was "the renunciation of the career of literature for the more direct path of political action," and at last in 1861 we find him recurring to the long-cherished hope of being able to leave the stormy arena of politics and consecrate the last years of his life to the dream of his youth. He had specially contemplated three considerable literary undertakings—a volume of Thoughts on Religion, a popular History of Italy, to enable the working classes to apprehend what he conceived to be the "mission" of Italy in God's providential ordering of the world, and a comprehensive collection of translations of ancient and modern authors, which was to have been achieved. No one, however, can read even the briefest and most occasional writing of Mazzini without gaining some impression of the simple grandeur of the man, the lofty elevation of his moral tone, and the penetration of his mind with the human problems which interested himself in the progressive development of humanity. His last public utterance is to be found in a highly characteristic article on Renan's Réforme Morale et Intellectuelle, finished on the 3rd of March 1872, and published in the last pages of the (1872), and of the 40,000 letters of Mazzini only a small part have been published. In 1887 two hundred unpublished letters were printed at Turin (Duecento lettere inedite di Giuseppe Mazzini), in 1895 the Letters intimi were published in Paris, and in 1905 Francesco Rispoli published a Della vita et lettere di Giuseppe Mazzini (Turin, 1905). A popular edition of Mazzini's writings has been undertaken by order of the Italian government.

For Mazzini's biography see Jessie White Mario, Della vita di Giuseppe Mazzini (Milan, 1886), a useful if somewhat too enthusiastic work; Bolton King, Mazzini (London, 1903); Count von Schack, Joseph Mazzini und die italienischen Einheit (Stuttgart, 1891). A. Luzzo's Giuseppe Mazzini (Milan, 1905) contains a great deal of valuable information, bibliographical and critical, and a Dolce Lettere in Giovanni Italia e Giuseppe Mazzini (Milan, 1906) publishes the correspondence between Mazzini and Luigi A. Melegari during the early days of "Young Italy." For the literary side of Mazzini's life see Peretti, Gli scritti letterari di Giuseppe Mazzini (Milan, 1894). (L. V. *)

MAZZONI, GIACOMO—MEADE, G. G. 945

Brown. During the early part of the Civil War he was at the front for six months, with the army of the Potomac, as an artist for Harper's Weekly, and in 1862-1865 he was in Italy, being one of the time attached to the United States consulate at Venice, while William D. Howells, his brother-in-law, was consul. He returned to America in 1865, but subsequently went back to Italy and lived at Florence. His first important work was a statue of Ethan Allen, now at the State House, Montpelier, Vermont. His principal works are: the monument to President Lincoln, Springfield, Illinois; "Ethan Allen" (1876), National Hall of Statuary, Capitoli, Washington; an heroic marble statue, "The Father of Waters," New Orleans; and "Triumph of Ceres," made for the Columbian Exposition, Chicago.

His brother, William Rutherford Mead (1846- ), graduated at Amherst College in 1867, and studied architecture in New York under Russell Sturgis, and also abroad. In 1879 he and J. F. McKim, with whom he had been in partnership for two years as architects, were joined by Stanford White, and formed the well-known firm of McKim, Mead & White.

MEAD, RICHARD (1673-1754), English physician, eleventh child of Matthew Mead (1630-1699), Independent divine, was born on the 11th August, 1673 at Newport, London. He studied at Utrecht for five years under J. G. Graevius; having decided to follow the medical profession, he then went to Leiden and attended the lectures of Paul Hermann and Archibald Pitcairne. In 1695 he graduated in philosophy and physic at Padua, and in 1696 he returned to London, entering at once on a successful practice. His Mechanical Account of Poisons appeared in 1702, and in 1703 he was admitted to the Royal Society, to whose Transactions he contributed in that year a paper on the parasitic nature of scabies. In the same year he was elected physician to St Thomas's Hospital, and appointed to read anatomical lectures at the Surgeons' Hall. On the death of John Radcliffe in 1714 Mead became the recognized head of his profession; he attended Queen Anne on her deathbed, and in 1727 was appointed physician to George II., having previously served him in that capacity when he was prince of Wales. He died in London on the 16th of February 1754.

Besides the Mechanical Account of Poisons (2nd ed., 1708), Mead published a treatise De medicina humana et morbis inde ortundis (1704). A Short Discourse concerning Pestilential Contagion, and the Method to be used to prevent it (1720), De variolis et morbilis dissertation (1747). Medicus sacra, sive de morbis insignioribus quibus in Oblationibus excolentibus (1748), On the Scourge (1749) and Montia et praecipue medica (1751). A Life of Mead by Dr Matthew Maty appeared in 1755.

MEAD. (1) A word now only used more or less poetically for the commoner form "meadow," properly land laid down for grass and cut for hay, but often extended in meaning to include pasture-land. "Meadow" represents the oblique case, madue, of O. Eng. mead, which comes from the root seen in "mow;" the word, therefore, means "mowed land." Cognate words appear in other Teutonic languages, a familiar instance being Ger. mait, seen in place-names such as Zermatt, Andermatt, &c. (See Grass.) (2) The name of a drink made by the fermentation of honey mixed with water. Alcoholic drinks made from honey were common in ancient times, and during the middle ages throughout Europe. The Greeks and Romans knew of such under the names of ἰδρυμα and hydromel; melusin was a form of mead with the addition of wine. The word is seen in Latin as a Teutonic loan-word in Duo melius, Me (Mer. Mel or Meh), and is cognate with Ger. meh, wine, and Sansk. maddhu, sweet drink. "Methelin," another word for mead, properly a medicated or spiced form of the drink, is an adaptation of the Welsh meddyglwch, which is derived from meddyg, healing (Lat. medicus) and ilyon, liquor. It therefore means "spiced or medicated drink," and is not etymologically connected with "mead."

MEADE, GEORGE GORDON (1815-1872), American soldier, was born of American parentage at Cadiz, Spain, on the 31st of December 1815. On graduation at the United States Military Academy in 1835, he served in Florida with the 3rd Artillery against the Seminoles. Resigning from the army in 1836, he
MEADE, W.—MEAGHER became a civil engineer and constructor of railways, and was engaged under the war department in survey work. In 1842 he was appointed a second lieutenant in the corps of topographical engineers. In the war with Mexico he was on the staffs successively of Generals Taylor, J. Worth and Robert Patterson, and was brevetted for gallant conduct at Monterey. Until the Civil War he was engaged in various engineering works, mainly in connexion with lighthouses, and later as a captain of topographical engineers in the survey of the northern lakes. In 1861 he was appointed brigadier-general of volunteers, and had command of the 2nd brigade of the Pennsylvania Reserves in the Army of the Potomac under General M'Call. He served in the Seven Days, receiving a severe wound at the action of Frazier's Farm. He was absent from his command until the second battle of Bull Run, after which he obtained the command of his division. He distinguished himself greatly at the battles of South Mountain and Antietam. At Fredericksburg he and his division won great distinction by their attack on the position held by Jackson's corps, and Meagher was promoted major-general of volunteers, to date from the 29th of November. Soon afterwards he was placed in command of the V. corps. At Chancellorsville he displayed great intrepidity and energy, and on the eve of the battle of Gettysburg was appointed to succeed Hooker. The choice was unexpected, but Meade justified it by his conduct of the operations, and in the famous three days' battle he inflicted a complete defeat on General Lee's army. His reward was the commission of brigadier-general in the regular army. In the autumn of 1863 a war of manœuvr was fought between the two commanders, on the whole favourably to the Union arms. Grant, commanding all the armies of the United States, joined the Army of the Potomac in the spring of 1864, and remained with it until the end of the war; but he continued Meade in his command, and successfully urged his appointment as major-general in the regular army (Aug. 18, 1864), eulogizing him as the commander who had successfully met and defeated the enemy, and who had covered his name, Meagher, on the Confederate side. After the war Meade commanded successively the military division of the Atlantic, the department of the east, the third military district (Georgia and Alabama) and the department of the south. He died at Philadelphia on the 6th of November, 1872. The degree of LL.D. was conferred upon him by Harvard University, and his scientific attainments were recognized by the American Philosophical Society and the Philadelphia Academy of Natural Sciences. There are statues of General Meade in Philadelphia and at Gettysburg.

MEADE, WILLIAM (1780-1862), American Protestant Episcopal bishop, the son of Richard Kidder Meade (1740-1805), one of General Washington's aides during the War of Independence, was born on the 11th of November 1789, near Millwood, in the part of Frederick county which is now Clarke county, Virginia. He graduated as valedictorian in 1808 at the college of New Jersey (Princeton); studied theology under the Rev. Walter Addison of Maryland, and in Princeton; was ordained deacon in 1811 and priest in 1814; and preached both in the Stone Chapel, Millwood, and in Christ Church, Alexandria, for some time. He became assistant bishop of Virginia in 1829; was pastor of Christ Church, Norfolk, in 1834-1836; in 1841 became bishop of Virginia; and in 1842-1862 was president of the Protestant Episcopal Theological Seminary in Virginia, near Alexandria, delivering an annual course of lectures on pastoral theology. In 1830 he had acted as the agent of the American Colonization Society to purchase slaves, illegally brought into Georgia, which had become the property of that state and were sold publicly at Milledgeville. He had been prominent in the work of the Education Society, which was organized in 1818 to advance funds to needy students for the ministry of the American Episcopal church, and in the establishment of the Theological Seminary near Alexandria, as he was afterwards in the work of the American Tract Society, and the Bible Society. He was a founder and president of the Evangelical Knowledge Society (1847), which, opposing what it considered the heterodoxy of many of the books published by the Sunday School Union, attempted to displace them by issuing works of a more evangelical type. A low Churchman, he strongly opposed Tractarianism. He was active in the case against Bishop Henry Ustick Onderdonk (1780-1858) of Pennsylvania, who because of intemperance was forced to resign and was suspended from the ministry in 1844; in that against Bishop Benjamin Tredwell Onderdonk (1791-1861) of New York, who in 1845 was suspended from the ministry on the charge of intoxication and improper conduct; and in that against Bishop G. W. Doane of New Jersey. He fought against the threatening secession of Virginia, but acquiesced in the decision of the state and became presiding bishop of the Southern Church. He died in Richmond, Virginia, on the 14th of March 1862.

Among his publications beside many sermons, were A Brief Review of the Episcopal Church in Virginia (1845); Wilburforce, Cramer, Jewett and the Prayer Book on the Incarnation (1850); Reasons for Loving the Episcopal Church (1852); and Old Churches, Ministers and Families of Virginia (1857); a storehouse of material on the ecclesiastical history of the state.

See the Life by John Johns (Baltimore, 1867).

MEADVILLE, a city and the county-seat of Crawford county, Pennsylvania, U.S.A., on French Creek, 36 m. S. of Erie. Pop. (1900), 10,291, of whom 912 were foreign-born and 173 were negroes; (1910 census) 12,780. It is served by the Erie, and the Bessmer & Lake Erie railways. Meadville has three public parks, two general hospitals and a public library, and is the seat of the Pennsylvania College of Music, of a commercial college, of the Meadville Theological School (1844, Unitarian), and of Allegheny College (co-educational), which was opened in 1825, came under the general patronage of the Methodist Episcopal Church in 1833, and in 1909 had 322 students (200 men and 122 women). Meadville is the commercial centre of a good agricultural region, which also abounds in oil and natural gas. The Erie Railroad has extensive shops here, which in 1905 employed 46-5% of the total number of wage-earners, and there are various manufactures. The factory product in 1905 was valued at $2,074,600, being 24.4% more than that of 1900. Meadville, the oldest settlement in N.W. Pennsylvania, was founded as a fortified post by David Mead in 1793, laid out as a town in 1795, incorporated as a borough in 1823 and chartered as a city in 1866.

MEAGHER, THOMAS FRANCIS (1823-1867), Irish nationalist and American soldier, was born in Waterford, Ireland, on the 3rd of August 1823. He graduated at Stonyhurst College, Lancashire, in 1843, and in 1844 began the study of law at Dublin. He became a member of the Young Ireland Party in 1845, and in 1847 was one of the founders of the Irish Confederation. In March 1848 he made a speech before the Confederation which led to his arrest for sedition, but at his trial the jury failed to agree and he was discharged. In the following July the Confederation created a "war directory" of five, of which Meagher was a member, and he and William Smith O'Brien travelled through Ireland for the purpose of starting a revolution. The attempt proved abortive; Meagher was arrested in August, and in October was tried for high treason before a special commission at Clonmel. He was found guilty and was condemned to death, but his sentence was commuted to life imprisonment in Van Diemen's Land, whither he was transported in the summer of 1849. Early in 1852 he escaped, and in May reached New York City. He made a tour of the cities of the United States as a popular lecturer, and then studied law and was admitted to the New York bar in 1855. He made two unsuccessful ventures in journalism, and in 1857 went to Central America, where he acquired material for another series of lectures. In 1861 he was captain of a company (which he had raised) in the 69th regiment of New York volunteers and fought at the first battle of Bull Run; he then organized an Irish brigade, of whose first regiment he was colonel until the 3rd of February 1862, when he was appointed to the command of this organization with the rank of brigadier-general. He took part in the siege of Yorktown, the battle of Fair Oaks, the seven days' battle before
MEAL (1) (A word common to Teutonic languages, cf. Ger. Brot, Du. melk; the ultimate source is the root seen in various Teutonic words meaning “to grind,” and in Eng. “mill,” Lat. mola, molière, Gr. μύλον”), a powder made from the edible part of any grain or pulse, with the exception of wheat, which is known as “flour.” In America the word is specifically applied to the meal produced from Indian corn or maize, as in Scotland and Ireland to that produced from oats, while in South Africa the ears of the Indian corn itself are called “meals.” (2) Properly, eating and drinking at regular stated times of the day, as breakfast, dinner, etc., hence taking of food at any time and also the food provided. The word was in O.E. meal, which also had the meanings (now lost) of time, mark, measure, &c., which still appear in many forms of the word in Teutonic languages; thus Ger. Mahl, time, mark, cf. Denkmal, monument, Mal, meal, repast, or Du. maal, Swed. mal, also with both meanings. The ultimate source is the pre-Teutonic root me- ma-—to measure, and the word thus stood for a marked-out point of time.

MEALIE, the South African name for Indian corn or maize. This was so generally represented as the pronunciation of the Cape Dutch mije, an adaptation of milho (da India), the millet of India, the Portuguese name for millet, used in South Africa for maize.

MEAN, an homonymous word, the chief uses of which may be divided thus: (1) A verb with two principal applications, to intend, purpose or design, and to signify. This word is in O.E. meanan, and cognate forms appear in other Teutonic languages, cf. Du. meenen, Ger. meinen. The ultimate origin is usually taken to be the root me-, to think, the root of “mind.” (2) An adjective and substantive meaning “that which is in the middle.” This is derived through the O. Fr. men, meien or moien, modern moyen, from the late Lat. adjective medianus, from medius, middle. The law French form mesine is still preserved in certain legal phrases (see Mesne). The adjective “mean” is chiefly used in the sense of “average,” as in mean temperature, mean birth rate, &c., and

“Mean” as a substantive has the following principal applications: it is used of that quality, course of action, condition, state, &c., which is equally distant from two extremes, as in such phrases as the “golden (or happy) mean.” For the philosophic application see ARISTOTELE AND ETHICS.

In mathematics, the term “mean,” in its most general sense, is given to some function of two or more quantities which (1) becomes equal to each of the quantities when they themselves are made equal, and (2) is unaffected in value when the quantities suffer any transpositions. The three commonest means are the arithmetical, geometrical, and harmonic; of less importance are the contraharmonical, arithmetico-geometrical, and quadratic.

From the sense of that which stands between two things, “mean,” or the plural “means,” often with a singular construction, takes the further significance of agency, instrument, &c., of which that produces some result, hence resource capable of producing a result, particularly the pecuniary or other resources by which a person is enabled to live, and so used either of employment or of property, wealth, &c. There are many adverbial phrases, such as “by all means,” “by no means,” &c., which are extensions of “means” in the sense of agency.

The word “mean” (like the French moyen) had also the sense of middling, moderate, and this considerably influenced the use of “mean” (3). This, which is now chiefly used in the sense of inferior, low, ignoble, or of aversive, penurious, “stingy,” meant originally that which is common to more persons or things than one. The word in O. E. is gemætne, and is represented in the modern Ger. gemein, common. It is cognate with Lat. communis, from which “common” is derived. The descent in meaning from that which is shared alike by several to that which is inferior, vulgar or low, is paralleled by the use of “common.”

In astronomy the “mean sun” is a fictitious sun which moves uniformly in the celestial equator and has its right ascension always equal to the sun’s mean longitude. The time recorded by the mean sun is termed mean-solar or clock time; it is regular as distinct from the non-uniform solar or sun-time.

The “mean moon” is a fictitious moon which moves around the earth with a uniform velocity and in the same time as the real moon. The “mean longitude” of a planet is the longitude of the “mean” planet, i.e., a fictitious planet performing uniform revolutions in the same time as the real planet.

The arithmetical mean of $n$ quantities is the sum of the quantities divided by their number $n$. The geometrical mean of $n$ quantities is the $n$th root of their product. The harmonic mean of $n$ quantities is the arithmetical mean of their reciprocals. The significance of $a, b, c$ in the elementary arithmetical mean of $n$ quantities; these will be denoted by $a, b, c$. The arithmetical mean $b$, is seen to be such that the terms $a, b, c$ are in arithmetical progression, i.e., $b = \frac{1}{2} (a+c)$; the geometrical mean $b$ places $a, b, c$ in geometrical progression, i.e., $b^2 = ac$; the harmonic mean $a$, of $b, c$ is such that the harmonic mean $a$, of $b, c$ places the quantities in harmonic proportion, i.e., $a/\epsilon:b-c = b-c/a+\epsilon$.

The contraharmonical mean is the quantity $b$ given by the proportion $a : c = b-a : b-c$.

The arithmetico-geometrical mean of two quantities is obtained by first forming the geometrical and arithmetical means, then forming the means of these means, and repeating the process until the numbers become equal. They were invented by Gauss to facilitate the computation of elliptic integrals. The quadratic mean of $n$ quantities is the square root of the arithmetical mean of their squares.

MEASLES, (Morbili, Ruboel; the M. E. word is measeles, properly a diminutive of a word meaning “spot,” O.H.G. measa, cf. “mazer”); the equivalent is Ger. Masern; Fr. Rougeole, an acute infectious disease occurring mostly in children. It is mentioned in the writings of Rhazes and others of the Arabian physicians in the 10th century. For long, however, it was held to be a variety of small-pox. After the non-identity of these two diseases had been established, measles and scarlet-fever continued to be confounded with each other; and in the account given by Thomas Sydenham of epidemics of measles in London in 1670 and 1674 it is evident that even that accurate observer had not as yet clearly perceived their pathological distinction, although it would seem to have been made a century earlier by Giovanni Filippo Ingrassias (1510-1580), a physician of Palermo. The specific microorganism responsible for measles has not been definitely isolated.

Its progress is marked by several stages more or less sharply defined. After the reception of the contagion into the system, there follows a period of incubation or latency during which scarcely any disturbance of the health is perceptible. This period generally lasts for from ten to fourteen days, when it is followed by the invasion of the symptoms specially characteristic of measles. These consist in the somewhat sudden onset of acute catarrh of the mucous membranes. At this stage minute white spots in the buccal mucous membrane frequently occur; when they do, they are diagnostic of the disease. Sneezing, accompanied with a watery discharge, sometimes bleeding, from the nose, redness and watering of the eyes, cough of a short, frequent, and noisy character, with little or no expectation, hoarseness of the voice, and occasionally sickness and diarrhoea, are the chief local phenomena of this stage. With these there is well-marked febrile disturbance, the temperature being elevated to $102^\circ$-$104^\circ$ F., and the pulse rapid, while headache, thirst, and restlessness are usually present. In some instances, these initial symptoms are slight, and the child is allowed to associate with
MEASLES

others at a time when, as will be afterwards seen, the contagion of the disease is most active. In rare cases, especially in young children, convulsions usher in, or occur in the course of, this stage of invasion, which lasts as a rule for four or five days, the febrile symptoms, however, showing some tendency to undergo abatement after the second day. On the fourth or fifth day after the invasion, sometimes later, rarely earlier, the characteristic eruption appears on the skin, being first noticed on the brow, cheeks, chin, also behind the ears, and on the neck. It consists of small spots of a dusky red or crimson colour, just like flea-bites, slightly elevated above the surface, at first isolated, but tending to become grouped into patches of irregular, occasionally crepetic, outline, with portions of skin free from the eruption intervening. The face acquires a swollen and bloated appearance, which, taken with the catarrh of the nostrils and eyes, is almost characteristic, and renders the diagnosis at this stage a matter of no difficulty. The eruption spreads downwards over the body and limbs, which are soon thickly studded with the red spots or patches. Sometimes these become confluent over a considerable surface. The rash continues to come out for two or three days, and then begins to fade in the order in which it first showed itself, namely from above downwards. By the end of about a week after its first appearance scarcely any trace of it is left, and is beyond a faint tint of the skin. Usually during convalescence slight peeling of the epidermis takes place, but much less distinctly than is the case in scarlet fever. At the commencement of the eruptive stage the fever, catarrh, and other constitutional disturbance, which were present from the beginning, become aggravated, the temperature often rising to 105° or more, and there is headache, thirst, furred tongue, and soreness of the throat, upon which red patches similar to those on the surface of the body may be observed. These symptoms usually decline as soon as the rash has attained its maximum, and often there occurs a sudden and extensive fall of temperature, indicating that the crisis of the disease has been reached. In favourable cases convalescence proceeds rapidly, the patient feeling perfectly well even before the rash has faded from the skin.

Measles may, however, occur in a very malignant form, in which the symptoms throughout are of urgent character, the rash but feebly developed, and of dark purple hue, while there is great prostration, accompanied with intense catarrh of the respiratory or gastro-intestinal mucous membrane. Such cases are rare, occurring mostly beyond a faint tint of the skin. Usually during convalescence slight peeling of the epidermis takes place, but much less distinctly than is the case in scarlet fever. At the commencement of the eruptive stage the fever, catarrh, and other constitutional disturbance, which were present from the beginning, become aggravated, the temperature often rising to 105° or more, and there is headache, thirst, furred tongue, and soreness of the throat, upon which red patches similar to those on the surface of the body may be observed. These symptoms usually decline as soon as the rash has attained its maximum, and often there occurs a sudden and extensive fall of temperature, indicating that the crisis of the disease has been reached. In favourable cases convalescence proceeds rapidly, the patient feeling perfectly well even before the rash has faded from the skin.

Measles as a disease derives its chief importance from the risk, by no means slight, of certain complications which are apt to arise during its course, more especially inflammatory affections of the respiratory organs. These are most likely to occur in the colder seasons of the year and in very young and delicate children. It has been already stated that irritation of the respiratory passages is one of the symptoms characteristic of measles, but that this subsides with the decline of the eruption. Not unfrequently, however, these symptoms, instead of abating, become aggravated, and bronchitis of the capillary form (see Bronchitis), or pneumonia, generally of the diffuse or lobular variety (see Pneumonia), supervene. By far the greater proportion of the mortality in measles is due to its complications, of which those just mentioned are the most common, but which also include inflammatory affections of the larynx, with attacks of croup, oropharyngeal, and also diarrhoea, assuming a desetentary character. Or there may remain as direct results of the disease chronic ophthalmitis, or discharge from the ears with deafness, and occasionally a form of gangrene affecting the tissues of the mouth or cheeks and other parts of the body, leading to disfigurement and gravely endangering life.

Apart from those immediate risks there appears to be a tendency in many cases for the disease to leave behind a weakened and vulnerable condition of the general health, which may render children, previously robust, delicate and liable to chest complaints, and is in no a few instances the precursor of some of those tuberculous affections to which the period of childhood and youth is liable. These various effects or sequelae of measles indicate that although in itself a comparatively mild ailment, it should not be regarded with indifference. Indeed it is doubtful whether any other disease of early life demands more careful watching as to its influence on the health. Happily many of those attending evils may by proper management be averted.

Measles is a disease of the earlier years of childhood. Like other infectious maladies, it is admittedly rare, though not unknown, in nurslings or infants under six months old. It is comparatively seldom met with in adults, but this is due to the fact that most persons have undergone an attack in early life. Where this has not been the case, the old suffer equally with the young. All races of men appear liable to this disease, provided that which constitutes the essential factor in its origin and spread exists, namely, contagion. Some countries enjoy long immunity from outbreaks of measles, but it has frequently been found in such cases that when the contagion has once been introduced the disease extends with great rapidity and virulence. This was shown by the epidemic in the Faroe Islands in 1846, where, within six months after the arrival of a single case of measles, the entire community was affected and many perished; and the similarly produced and still more destructive outbreak in Fiji in 1875, in which it was estimated that about one-fourth of the inhabitants died from the disease in about three months. In both these cases the great mortality was due to the complications of the malady, specially induced by overcrowding, insanitary surroundings, the absence of proper nourishment and nursing for the sick, and the utter prostration and terror of the people, and to the disease being specially malignant, occurring on what might be termed virgin soil. 1 It may be regarded as an invariable rule that the first epidemic of any disease in a community is specially virulent, each successive attack conferring a certain immunity.

In many lands, such as the United Kingdom, measles is rarely absent, especially from large centres of population, where sporadic cases are found at all seasons. Every now and then epidemics arise from the extension of the disease among those members of a community who have not been in some measure protected by a previous attack. There are few diseases so contagious as measles, and when the epidemic outbreaks are attacked and many perished; and the similarly produced and still more destructive outbreak in Fiji in 1875, in which it was estimated that about one-fourth of the inhabitants died from the disease in about three months. In both these cases the great mortality was due to the complications of the malady, specially induced by overcrowding, insanitary surroundings, the absence of proper nourishment and nursing for the sick, and the utter prostration and terror of the people, and to the disease being specially malignant, occurring on what might be termed virgin soil. 1 It may be regarded as an invariable rule that the first epidemic of any disease in a community is specially virulent, each successive attack conferring a certain immunity.

Treatment.—The treatment embraces the preventive measures to be adopted by the isolation of the sick at as early a period as possible. Epidemics have often, especially in limited localities, been curtailed by such a precaution. In families with little house accommodation this measure is frequently, for the reason given regarding the communicable period of the disease, ineffectual; nevertheless where practicable it is always to be encouraged.

The affected child should, if possible, be kept at home from school for a time (probably about three weeks from the outbreak in the family would suffice if no other case occur in the interval), and all clothing in contact with the patient or nurses should be disinfected. In extensive epidemics it is often desirable to close the schools for a time. As regards special treatment, in an ordinary case of measles little is required beyond what is necessary in febrile conditions generally. Confinement to bed in a somewhat darkened room, into which, however, air is freely 1 Transactions of the Epidemiological Society (London, 1877).
admitted; light, nourishing, liquid diet (soups, milk, &c.), water almost ad lib., to drink, and mild diaphoretic remedies such as the acetate of ammonia or ipecacuanha, are all that is necessary in the febrile stage. When the fever is very severe, sponging the body generally or the chest and arms affords relief. The serious chest complications of measles are to be dealt with by those applicable for the relief of the particular symptoms (see BRONCHITIS; PNEUMONIA). The preparations of ammonia are of special efficacy. During convalescence the patient must be guarded from exposure to cold, and for a time after recovery the state of the health ought to be watched with a view of averting the evils, both local and constitutional, which too often follow this disease.

"German measles" (Röteln, or Epidemic Rossola) is a term applied to a contagious eruptive disorder having certain points of resemblance to the various countries to scarlet fever, but exhibiting the distinct individuality in the fact that it protects from neither of these diseases. It occurs most commonly in children, but frequently in adults also, and is occasionally seen in extensive epidemics. Beyond confinement to the house in the eruptive stage, which, from the slight symptoms experienced, is often difficult of accomplishment, no special treatment is called for. There is little doubt that the disease is often mistaken for true measles, and many of the alleged second attacks of "late measles" are really cases of rothel. The chief points of difference are the following: (1) The absence of distinct premonitory symptoms, the stage of invasion, which in measles is usually of four days' duration, and accompanied with well-marked fever, cough, and general chill, in rothel is sudden or exceedingly slight, enduring only for one day. (2) The eruption of rothel, which, although as regards its locality and manner of progress similar to measles, differs somewhat in its appearance, the spots are smaller in size, and, being on the face, neck, and hands, are less apt to group in crescentic patches. The rash attains its maximum in about one day, and quickly disappears. There is not the same increase of temperature in this stage as in measles. (3) The presence of white spots on the buccal mucous membrane, the characteristic "cheeks" of rothel. (4) The milder character of the symptoms of rothel throughout its whole course, and the absence of complications and of liability to subsequent impairment of health such as have been seen to appertain to measles.

MEAT, a word originally applied to food in general, and so still used in such phrases as "meat and drink"; but now, except as an archaism, generally used of the flesh of certain domestic animals, slaughtered for human food by butchers, "butcher's meat," as opposed to "game," that of wild animals, "fish" or "poultry." Cognate forms of the O. Eng. meæt are found in certain Teutonic languages, e.g. Swed. mat, Dan. mad, and O. H. Ger. Mas. The ultimate origin has been disputed; the New English Dictionary considers probable a connexion with the root med-, "to eat," seen in Sansk. médá, Lat. madere, "to be wet," and Eng. mat, "the fruit of the beech for food for pigs. See DIETETICS; FOOD PRESERVATION; PUBLIC HEALTH; AGRICULTURE; and the sections dealing with agricultural statistics under the name of meat.

MEATH (pronounced with th soft, as in the), a county of Ireland in the province of Leinster, bounded E. by the Irish Sea, S.E. by Dublin, S. by Kildare and King's County, W. by Westmeath, N.W. by Cavan and Monaghan, and N.E. by Louth. Area 579,330 acres, or about 905 sq. m. In some districts the surface is varied by hills and swells, which to the west reach a considerable elevation, although the general features of a fine champaign country are never lost. The coast, low and shelving, extends about 10 m., but there is no harbour of importance. Laytown is a small seaside resort, 5 m. S.E. of Drogheda. The Boyne enters the county at its south-western extremity, and flowing north-east to Drogheda divides it into two almost equal parts. At Navan it receives the Blackwater, which flows south-west from Cavan. Both these rivers are noted for their trout, and salmon are taken in the Boyne. The Boyne is navigable for barge as far as Navan whence a canal is carried to Trim. The Royal Canal passes along the southern boundary of the county from Dublin.

In the north is a broken country of Silurian rocks with much igneous material, partly contemporaneous, partly intrusive, near Slane. Carboniferous Limestone stretches from the Boyne valley to the Dublin border, giving rise to a flat plain especially suitable for grazing. Outliers of higher Carboniferous strata occur on the surface; but the Coal Measures have all been removed by denudation.

The climate is genial and favourable for all kinds of crops, there being less rain than even in the neighbouring counties. Except a small portion occupied by the Bog of Allen, the county is verdant and fertile. The soil is principally a rich deep loam resting on limestone gravel, but varies from a strong clayey loam to a light sandy-gravelly soil. The proportion of tillage to pasture is roughly 1 to 3. Oats, potatoes and turnips are the principal crops, but all decrease. The numbers of cattle, sheep and poultry, however, are increasing or well maintained. Agriculture, and its ancillary industries, are well attended to in the south of the county; the soil in the north is sown with grain. There are a few woollen manufactories.

The middle of the Midland Great Western railway skirts the southern boundary, with a branch line north from Cúisca to Dun and Kingscourt (county Cavan). From Trimession on this line a branch serves Trim and Athboy. From Drogheda (county Louth) a branch of the Great Northern railway crosses the county from east to West by Navan and Kells to Oldcastle. The county polyploids on 76,111 (1891) gave a large decrease, considerably above the average of Irish counties, and emigration is heavy. Nearly 93% are Roman Catholics. The chief towns are Navan (pop. 3,589), Kells (2,428) and Trim (1,513), the county town. Lesser market towns are Oldcastle and Athboy, an ancient town which received a charter from Henry IV. The county includes eighteen baronies. Assizes are held at Trim, and quarter sessions at Kells, Navan and Trim. The county is in the Protestant dioceses of Armagh, Kilmore and Meath, and in the Roman Catholic dioceses of Armagh and Meath. Before the Union in 1800 it sent fourteen members to parliament, but now only two members are returned, for the north and south divisions of the county respectively.

History and Antiquities.—A district known as Meath (Midhe), and including the present county of Meath as well as Westmeath and Longford, with parts of Cavan, Kildare and King's County, was formed by Tuatha (c. 130) into a kingdom to serve as mensal land or personal estate of the Ard Ri or over-king of Ireland. Kings of Meath reigned until 1173, and the title was claimed as late as the 15th century by their descendants, but at the date mentioned Hugh de Lacy obtained the lordship of the country and was confirmed in it by Henry II. Meath then came into the English "Pales." But though it was declared a county in the reign of Edward I. (1266), and though it came by descent into the possession of the Crown in the person of Edward IV., it was long before it was fully subdued and its boundaries clearly defined. In 1543 Westmeath was created a county apart from that of Meath, but as late as 1598 Meath was still regarded as a province by some, who included in it the counties Westmeath, East Meath, Longford and Cavan. In the early part of the 17th century it was at last established as a county, and no longer considered as a fifth province of Ireland.

There are two ancient round towers, one at Kells and the other in the churchyard of Donaghoire, near Navan. By the river Boyne near Sane there is an extensive ancient burial-place called Brugh. Here are some twenty burial mounds, the largest of which is that of New Grange, a domed tumulus erected above a circular chamber, which is entered by a narrow passage enclosed by great upright blocks of stone, covered with carvings. The mound is surrounded by remains of a stone circle, and the whole forms one of the most remarkable extant erections of its kind. Tara (g.v.) is famous in history, especially as the seat of a royal palace referred to in the well-known lines of Thomas Moore. Monastic buildings were very numerous in Meath, among the more important ruins being those of Duleek, which is said to have been the first ecclesiastical building in Ireland of stone and mortar; the extensive remains of Bective Abbey; and those of Clonard, where also were a cathedral and a famous college. Of the old fortresses, the castle of Trim still presents an imposing appearance. There are many fine old mansions.

MEAUX, a town of northern France, capital of an arrondissement in the department of Seine-et-Marne, and chief town of the agricultural region of Brie, 28 m. E.N.E. of Paris (pop. 10,065), 1,880. The town is built on a hill rising on the right bank of the Marne; on the left bank lies the old suburb of Le Marché, with which it is united by a bridge of the 16th century. Two rows of picturesque mills of the same period are built across the river. The cathedral of St Stephen dates from the 12th to the 16th centuries, and was restored in
MECCA

The 19th century. Of the two western towers, the completed one is that to the north of the facade, the other being disfigured by a slightly later roof. The building, which is 275 ft. long and 105 ft. high, consists of a short nave, with aisles, a fine transept, a choir and a sanctuary. The choir contains the statue and the tomb of Bossuet, bishop from 1681 to 1704, and the pulpit of the cathedral has been reconstructed with the panels of that from which the "eagle of Meaux" used to preach. The transept terminates at each end in a fine portal surmounted by a rose-window. The episcopal palace (17th century) has several curious old rooms; the buildings of the choir school are likewise of some archaeological interest. A statue of General Raoul (1870) stands in one of the squares.

Meaux is the centre of a considerable trade in cereals, wool, Brie cheeses, and other farm-produce, while its mills provide much of the flour with which Paris is supplied. Other industries are saw-milling, metal-founding, distilling, the preparation of vermicelli and preserved vegetables, and the manufacture of mustard, hosiery, plastics and machinery. There are nursery-gardens in the vicinity. The Canal de l'Oumo, which surrounds the town, and the Marne furnish the means of transport. Meaux is the seat of a bishopric dating from the 4th century, and has among its public institutions a sub-prefecture, and tribunals of first instance and of commerce.

In the Roman period Meaux was the capital of the Meldi, a small Gallic tribe, and in the middle ages of the Brie. It formed part of the kingdom of Austrasia, and afterwards belonged to the counts of Vermandois and Champagne, the latter of whom established important markets on the left bank of the Marne. Its communal charter, received from them, is dated 1170. A treaty signed at Meaux in 1229 after the Albigeois War sealed the submission of Raymond VII, Count of Toulouse. The town suffered much during the Jacquerie, the peasants receiving a severe check there in 1358; during the Hundred Years' War; and also during the Religious Wars, in which it was an important Protestant Centre. It was given to the king in 1589, and to Henry IV in 1594. On the high-road for invaders marching from Paris on the east of France, Meaux saw its environs ravaged by the army of Lorraine in 1652, and was laid under heavy requisitions in 1814, 1815 and 1870. In September 1597 Meaux was the scene of an attempt made by the Protestants to seize the French king Charles IX, and his mother Catherine de' Medicis. The plot, which is sometimes called the "enterprise of Meaux," failed, the king and queen with their courtiers escaping to Paris. This conduct, however, on the part of the Huguenots had doubtless some share in influencing Charles to assent to the massacre of St Bartholomew.

MECCA (Arab. Makkah), the chief town of the Hejaz in Arabia, and the great holy city of Islam. It is situated two camel marches (the resting-place being Bahra or Hadda), or about 45 m. almost due E., from Jidda on the Red Sea. Thus on a rough estimate Mecca lies in 21° 25' N., 39° 50' E. It is said to be the center of the world (Suerd, xx. 46), and the old geographers observe that the whole Haram or sacred territory around the city is almost without cultivation or date palms, while fruit trees, springs, wells, gardens and green valleys are found immediately beyond. Mecca in fact lies in the heart of a mass of rough hills, intersected by a labyrinth of narrow valleys and passes, and projecting into the Tehama or low country on the Red Sea, in front of the great mountain wall that divides the coast-lands from the central plateau, though in turn they are themselves separated from the sea by a second curtain of hills forming the western wall of the great Wadi Marr. The inner mountain wall is pierced by only two great passes, and the valleys descending from these embrace on both sides the Mecca hills.

Holding this position commanding two great routes between the lowlands and inner Arabia, and situated in a narrow and

Mecca, says one of its citizens, in Wâqîdî (Kremer's ed., p. 196, or Muh. in Med., p. 100), is a settlement formed for trade by the Haji—letting rooms, acting as guides and directors in the sacred ceremonies, as contractors and touts for land and sea transport, as well as exploiting the many benficaions that flow to the holy city: while the surrounding Bedouins derive support from the camel-transport it demands and from the subsidies by which they are engaged to protect or abstain from molesting the pilgrim caravans. But the ancient "fairs of heathenism" were given up, and the traffic of the pilgrim season, sanctioned by the Prophet in Sur. ii. 194, was concentrated at Minâ and Mecca, where most of the pilgrims still have something to buy or sell, so that Minâ, after the sacrifice of the feast day, presents the aspect of a huge international fancy

3 Mecca, one of the name Makkah is Bakkah (Suerd, iii. 90; Bakri, 155 seq.). For other names and honorific epithets of the city see Bakri, ul supran, Azaq, p. 197, Yaqūt iv. 617 seq. The lists are in part corrupt, and some of the names (Kūthā and Arsh or Ursh., "the buts") are not properly names of the town as a whole.
fair. In the middle ages this trade was much more important than it is now. Ibn Jubair (ed. Wright, p. 172 seq.) in the 12th century describes the part of Mecca in the eight days following the feast as full of gems, ungents, precious drugs, and all rare merchandise from India, Irak, Khorkasân, and every part of the Moslem world.

The hills east and west of Mecca, which are partly built over and rise several hundred feet above the valley, so enclose the city that the ancient walls only barred the valley at three points, where three gates led into the town. In the time of Ibn Jubair the gates still stood though the walls were ruined, but now the gates have only left their names to quarters of the town. At the northern or upper end was the Bâb el Mâlâ, or gate of the upper quarter, whence the road continues up the valley towards Minâ and Arabia as well as towards Zeima and the Nejd. Beyond the gate, in a place called the Haijûn, is the chief cemetery, commonly called el Mâlâ, and said to be the resting-place of many of the companions of Mahomet. Here a cross-road, running over the hill to join the main Medina road from the western gate, turns off to the west by the pass of Kadâ, the point from which the troops of the Prophet stormed the city (A.D. 624). Here too the body of Zainâb was brought to Mecca by Hajjâj. The lower or southern gate, at the Masfâla quarter, opened on the Yemen road, where the rain-water from Mecca flows off into an open valley. Beyond, there are mountains on both sides; on that to the east, commanding the town, is the great castle, a fortress of considerable strength. The third or western gate, Bâb el-Omra (formerly also Bâb el-Zâhir, from a village of that name), lay almost opposite the great mosque, and opened on a road leading westward round the southern spurs of the Red Mountain. This is the way to Wâdi Fâtima and Medina, the Jidda road branching off from it to the left. Considerable suburbs now lie outside the quarter named after this gate; in the middle ages a pleasant country road led for some miles through partly cultivated land with good wells, as far as the boundary of the sacred territory and gathering place of the pilgrims at Tanim, near the mosque of Ayehsa. This is the spot on the Medina road now called the Omra, from a ceremonial connected with it which will be mentioned below.

The length of the sinuous main axis of the city from the farthest suburbs on the Medina road to the suburbs in the extreme north, now frequented by Bedouins, is, according to Burckhardt, 3500 paces. About the middle of this line the longitudinal thoroughfares are pushed aside by the vast courtyard and colonnades composing the great mosque, which, with its spacious arcades surrounding the Ka’ba and other holy places, and its seven minarets, forms the only prominent architectural feature of the city. The mosque is enclosed by houses with windows opening on the arcades and commanding a view of the Ka’ba. Immediately beyond these, on the side facing Jebel Abu Kobais, a broad street runs south-east and north-west across the valley. This is the Mas’â (sacred course) between the eminences of Safâ and Merwa, and has been from very early times one of the most lively bazaars and the centre of Meccan life. The other chief bazaars are also near the mosque in smaller streets. The general aspect of the town is picturesque; the streets are fairly spacious, though ill-kept and filthy; the houses are all of stone, many of them well-built and four or five storeys high, with terraced roofs and large projecting windows as in Jidda—a style of building which has not varied materially since the 10th century (Mukaddasî, p. 71), and gains in effect from the way in which the dwellings run up the sides and spurs of the mountains. Of public institutions there are baths, ribâts, or hospices, for poor pilgrims from India, Java, &c., a hospital and a public kitchen for the poor.

1 The older fairs were not entirely deserted till the troubles of the last days of the Omayyads (Azraqî, p. 131).
2 This is the cross-road traversed by Burckhardt (i. 109), and described by him as cut through the rocks with much labour.
3 Isâkhî gives the length of the city proper from north to south as 2 m., and the greatest breadth from the Jiyād quarter east of the great mosque across the valley and up the western slopes as two-thirds of the length.

The mosque is at the same time the university hall, where between two pilgrim seasons lectures are delivered on Mahomedan law, doctrine and connected branches of science. A poorly provided public library is open to the use of students. The madrassas or buildings around the mosque, originally intended as lodgings for students and professors, have long been let out to rich pilgrims. The minor places of visitation for pilgrims, such as the birthplaces of the prophet and his chief followers, are not notable. Both these and the court of the great mosque lie beneath the general level of the city, the site having been gradually raised by accumulated rubbish. The town in fact has little air of antiquity; genuine Arab buildings do not last long, especially in a valley periodically ravaged by tremendous floods when the tropical rains burst on the surrounding hills. The history of Mecca is full of the record of these inundations, unsuccessfully combated by the great dam drawn across the valley by the caliph Omar (Kutbeddin, p. 76), and later works of Mahdî.

The fixed population of Mecca in 1878 was estimated by Assistant-Surgeon Abîl-Razzâq at 50,000 to 60,000; there are large floating populations, but at present mainly on the proper season—pilgrims. The pilgrims of other seasons are beginning to arrive before those of the former season have all dispersed. At the height of the season the town is much overcrowded, and the entire want of a drainage system is severely felt. Fortunately good water is tolerably plentiful; for, though the wells are mostly undrinkable, and even the famous Zamzam water only available for medicinal or religious purposes, the underground conduit from beyond Arabia, completed by Sultan Selim II. in 1571, supplies to the public fountains a sweet and light water, containing, according to Abîl-Razzâq, a large amount of chlorides. The water is said to be free to townsmen, but is sold to the pilgrims at a rather high rate.

Medieval writers celebrate the copious supplies, especially of fine fruits, brought to the city from Taif and other fertile parts of Arabia. These fruits are still famous; rice and other foreign products are brought by sea to Jiddà; mutton, milk and butter are plentifully supplied from the desert. The industries all centre in the pilgrimage; the chief object of every Meccan—from the nobles and sheikhs, who use their influence to gain custom for the Jidda speculators in the pilgrimage traffic, down to the cicerones, pilgrim brokers, lodging-house keepers, and mendicants at the holy places—being to pilage the visitor in every possible way. The fanaticism of the Meccan is an affair of the purse; the mongrel population (for the town is by no means purely Arab) has exchanged the virtues of the Bedouin for the worst corruptions of Eastern town life, without casting off the ferocity of the desert, and it is hardly possible to find a worse certificate of character than the three parallel gashes on each cheek, called Tashrit, which are the customary mark of birth in the holy city. The unspeakable vices of Mecca are a scandal to all Islâm, and a constant source of wonder to pious pilgrims.

The slave trade has connexions with the pilgrimage which are not thoroughly clear; but under cover of the pilgrimage a great deal of importation and exportation of slaves goes on. Since the fall of Ibn Jubair the political position of Mecca

4 For details as to the ancient quarters of Mecca, where the several families or septs lived apart, see Azraqî, 455 pp. seq., and compare Yaqūbi, ed. Juynboll, p. 100. The minor sacred places are described at length by Azraqî with genuine memories of the Prophet and his times, or have spurious legends to conceal the fact that they were originally holy stones, wells, or the like, of heathen sanctity.

5 From a passage in Burckhardt's in his chapter on the floods of Mecca (pp. 53 seq.), says that 'Omar built two dams.

6 The corruption of manners in Mecca is no new thing. See the letter of the caliph Mahdî on the subject; Wüstenfeld, Chron. Mek., iv. 168.
MECCA

has always been dependent on the movements of the greater Mahommedan world. In the splendid times of the caliphs immense sums were lavished upon the pilgrimage and the holy city; and conversely the decay of the central authority of Islam brought with it a long period of faction, wars and misery, in which the most notable episode was the sack of Mecca by the Carmathians at the pilgrimage season of A.D. 930. The victors carried off the "black stone," which was not restored for twenty-two years, and then only for a great ransom, when it was plain that even the loss of its palladium could not destroy the sacred character of the city. Under the Fatimites Egyptian influence began to be strong in Mecca; it was opposed by the sultans of Yemen, while native princes claiming descent from the Prophet—the Hashimite amirs of Mecca, and after them the amirs of the house of Qatāda (since 1202)—attained to great authority and aimed at independence; but after the final fall of the Abbasids the Egyptian overlordship was definitely established by sultan Bimar (A.D. 1269). The Turkish conquest of Egypt transferred the supremacy to the Ottoman sultans (1517), who treated Mecca with much favour, and during the 16th century executed great works in the sanctuary and temple. The Ottomans, however, held to Mecca, and that of the amirs or sheikhs increased in proportion, culminating under Ghâlib, whose accession dates from 1786. Then followed the wars of the Wahhâbîs (see ARABIA and WAHHABIS) and the restoration of Turkish rule by the troopers of Mehemet 'Ali. By him the dignity of sheikh was deprived of much of its weight, and in 1827 a change of dynasty was effected by the appointment of Ibn 'Aun. Afterwards Turkish authority again decayed. Mecca is, however, officially the capital of a Turkish province, and has a governor-general and a Turkish garrison, while Mahommedan law is administered by a judge sent from Constantinople. But the real sovereign of Mecca and the Hejâz is the sheikh, who, as head of a princely family claiming descent from the Prophet, holds a sort of feudal position. The dignity of sheikh (or grand sheikh, as Europeans usually say for the sake of distinction, since all the kin of the princely houses reckoning descent from the Prophet are also named sheikhs), although by no means a religious pontificate, is highly respected owing to its traditional descent in the line of Hasan, son of the fourth caliph, who hold to this day, with their descendants, the title of the modern counterpart of the ancient amirs of Mecca, who were named in the public prayers immediately after the reigning caliph. When the great Mahommedan sultans had become too much occupied in internecine wars to maintain order in the distant Hejâz, those branches of the Hassânids which from the beginning of Islam had retained rural property in Arabia usurped power in the holy cities and the adjacent Bedouin territories. About A.D. 960 they established a sort of kingdom with Mecca as capital. The influence of the princes of Mecca has varied from time to time, according to the strength of the foreign protectorate in the Hejâz or in consequence of feuds among the branches of the house; until about 1882 it was for most purposes much greater than that of the Turks. The latter were strong enough to hold the garrisoned towns, and thus the sultan was able within certain limits—playing off one against the other the two rival branches of the aristocracy, viz. the kin of Ghâlib and the house of Ibn 'Aun—to assert the right of designating or removing the sheikh, to whom in turn he owed the possibility of maintaining, with the aid of considerable pensions, the semblance of his much-prized lordship over the holy cities. The grand sheikh can muster a considerable force of freedmen and clients, and his kin, holding wells and lands in various places through the Hejâz, act as his deputies and administer the old Arabic customary law to the Bedouin. To this influence the Hejâz owes what little of law and order it enjoys. During the last quarter of the 19th century Turkish influence became preponderant in western Arabia, and the railway from Syria to the Hejâz tended to consolidate the sultan's supremacy. After the sheikhs, the principal family of Mecca is the house of Shâiba, which holds the hereditary custodianship of the Ka'ba.

The Great Mosque and the Ka'ba.—Long before Mahomet the chief sanctuary of Mecca was the Ka'ba, a rude stone building without windows and having a door 7 ft. from the ground; and so named from its resemblance to a monstrous astragalus (die) of about 40 ft. cube, though the shapeless structure is not really an exact cube nor even exactly rectangular.1 The Ka'ba has been rebuilt more than once since Mahomet purified it of idols and adopted it as the chief sanctuary of Islam, but the old form has been preserved, except in secondary details;2 so that the "Ancient House," as it is titled, is still essentially a heathen temple, adapted to the worship of Islam by the clumsy fiction that it was built by Abraham and Ishmael by divine revelation as a temple of pure monotheism, and that it was only temporarily perverted to idol worship from the time when 'Amr ibn Lohair introduced the statue of Hoba from Syria3 till the victory of Islam. This fiction has involved the superinduction of a new mythology over the old heathen ritual, which remains practically unchanged. Thus the chief object of veneration is the black stone, which is fixed in the external angle facing Safâ. The building is not exactly oriented, but it may be called the south-east corner. Its technical name is called the dawâr or the door name of the road (south-west, Syrian (north-west), and Irâk (north-east)) corners, from the lands to which they approximately point. The black stone is a small dark mass a span long, with an aspect suggesting volcanic or meteoric origin, fixed at such a height that it can be conveniently kissed by a person of middle size. It was broken by fire in the siege of A.D. 683 (not, as many authors relate, by the Carmathians), and the pieces are kept together by a silver setting. The history of this heavenly stone, given by Gabriel to Abraham, does not conceal the fact that it was originally a fetish, the most venerated of a multitude of idols and sacred stones which stood all round the sanctuary in the time of Mahomet. The Prophet destroyed the idols, but he left the characteristic form of worship—the tawâf, or sevenfold circuit of the sanctuary, the worshipper kissing or touching the objects of his veneration—and besides the black stone he recognized the so-called "southern" stone, the same presumably as that which is still touched in the tawâf at the Yemen corner (Muh. in Med. pp. 356, 425). The ceremony of the tawâf was not, however, connected with the Meccan sanctuary, but with other ancient Arabian sanctuaries.4 It was, as it still is, a frequent religious exercise of the Meccans, and the first duty of one who returned to the city or arrived there under a vow of pilgrimage; and thus the outside of the Ka'ba was and is more important than the inside. Islam did away with the worship of idols; what was lost in interest by their suppression

1 The exact measurements (which, however, vary according to different authorities) are stated to be: sides 37 ft. 2 in. and 38 ft. 4 in.; ends 31 ft. 7 in. and 29 ft. 4 in.; height 55 ft.

2 The Ka'ba of Mahomet's time was the successor of an older building, said to have been destroyed by fire. It was constructed in the still usual rude style of Arabic masonry, with string courses of timber between the stones (like Solomon's Temple). The roof was light and covered with tiles; the building rose on a raised platform and approached by a stair (probably on account of the floods which often swept the valley); and worshipers left their shoes under the stair before entering. During the first siege of Mecca (A.D. 683), the building was lowered and rebuilt. It was again lowered and rebuilt in 743. It became gradually smaller and better style of solid ashlar-work. After his death his most glowering innovations (the introduction of two doors on a level with the ground, and the extension of the building lengthwise to include the Hijs) were corrected by Hâjâj, under orders from the caliph, but the building retained its more solid structure. The roof now rested on three pillars, and the height was raised one-half. The Ka'ba was again entirely rebuilt after the flood of A.D. 1626, but since Hâjâj there has been no attempt to have it raised further.

3 Hoba was set up within the Temple over the pit that contained the sacred treasures. His chief function was connected with the sacred lot to which the Meccans were accustomed to betake themselves in all matters of consequence.

4 See Ibn Hāshām i. 54, Azzāki p. 80 (‘Uza‘ in Bâṣ Marr); Yâšū’il iii. 705 (Othîyâd); Bar Hebraeus on Psalm xii. 9. Stones worshipped by circling them bore the name dawâr or dawar (Krehl, Red. d. Araber, p. 69). The later Arabs not unnaturally viewed such cultus as imitated from that of Meqîth (Wâgb iv. 622, cf. Dozy, Israélite en Mecca, p. 125, who draws very perverse inferences).
has been supplied by the invention of spots consecrated by recollections of Abraham, Ishmael and Hagar, or held to be acceptable places of prayer. Thus the space of ten spans between the black stone and the door, which is on the east side, between the black and Irak corners, and a man’s height from the ground, is called the Mulaasam, and here prayer should be offered after the tawaif with outstretched arms and breast pressed against the house. On the other side of the door, against the same wall, is a shallow trough, which is said to mark the original site of the stone on which Abraham stood to build the Ka’ba. Here the growth of the legend can be traced, for the place is now called the "kneading-place" (Ma’jan), where the cement for the Ka’ba was prepared. This name and story do not appear in the older accounts. Once more, on the north side of the Ka’ba, there projects a low semicircular wall of marble, with an opening at each end between it and the walls of the house. The space within is paved with mosaic, and is called the Hijr. It is included in the tawaif, and two slabs of verde antico within it are called the graves of Ishmael and Hagar, and are places of acceptable prayer. Even the golden or gilded misal (water-spout) that projects into the Hijr marks a place where prayer is heard, and another such place is the part of the west wall close to the Yemen corner.

The feeling of religious conservatism which has preserved the structural rudeness of the Ka’ba did not prohibit costly surface decoration. In Mahomet’s time the outer walls were covered by a veil (or kiswa) of striped Yemen cloth. The caliphs substituted a covering of figured brocade, and the Egyptian government still sends with each pilgrim caravan from Cairo a new kiswa of black brocade, adorned with broad band embroidered with golden inscriptions from the Koran, as well as a richer curtain for the door. The door of two leaves, with its posts and lintel, is of silver gilt.

The interior of the Ka’ba is now opened but a few times every year for the general public, which ascends by the portable stair. The faithful proceed forward for the purpose. Foreigners can obtain admission at any time for a special fee. The modern descriptions, from observations made under difficulties, are not very complete. Little change, however, seems to have been made since the time of Ibn Jubair, who describes the floor and walls as overlaid with richly variegated marbles, and the upper half of the walls as plated with silver thickly gilt, while the roof was veiled with coloured silk. Modern writers describe the place as windowless, but Ibn Jubair mentions five windows of rich stained glass from Irak. Between the three pillars of teak hung thirteen silver lamps. A chest in the corner to the left of one entering contained Korans, and at the Irak corner a space was cut off enclosing the stair that leads to the roof. The door to this stair (called the door of mercy—Bab el-Rahma) was plated with silver by the caliph Motawakkil. Here, in the time of Ibn Jubair, the Maqam, or standing stone of Abraham was usually placed for better security, but it is now put only on great occasions.

The houses of ancient Mecca pressed close upon the Ka’ba, the noblest families, who traced their descent from Kosai, the reputed founder of the city, having their dwellings immediately round the sanctuary. To the north of the Ka’ba was the Dar el-Nadwa, or place of assembly of the Koreish. The multiplication of pilgrimages after Islam soon made it necessary to clear away the nearest dwellings and enlarge the place of prayer around the Ancient House. Omar, Othman and Ibn Jubair had all a share in this work, but the great founder of the mosque in its present form, with its spacious area and deep colonnades, was the caliph Mahdi, who spent enormous sums in bringing costly pillars from Egypt and Syria. The work was still incomplete at his death in A.D. 785, and was finished in less sumptuous style by his successor. Subsequent repairs and additions, extending down to Turkish times, have left little of Mahdi’s work untouched, though a few of the pillars probably date from his days. There are more than five hundred pillars in all, of very various style and workmanship, and the enclosure—250 paces in length and 200 in breadth, according to Burckhardt’s measurement—is entered by nineteen archways irregularly disposed.

After the Ka’ba the principal points of interest in the mosque are the well Zamzam and the Maqam Ibrahim. The former is a deep shaft enclosed in a massive vaulted building paved with marble, and, according to Mahomedan tradition, is the source (corresponding to the Beer-lahai-roi of Gen. xvi. 14) from which Hagar drew water for her son Ishmael. The legend tells that the well was long covered up and rediscovered by Abu Bakr, who, however, is said to have reddened the stone by a curative formula. Saints often appear to believers, and the site of the well is regarded as sacred. The Maqam Şuayb is a plain open space, popularly believed to have been the council chamber of Ishmael, the son of Abraham, at the time when Ishmael was taken to the Ka’ba; it is rarely entered.

Safa and Marwa.—In religious importance these two points or hillocks are connected by the Mash’ara and the principal route on pilgrimage.

The houses of ancient Mecca pressed close upon the Ka’ba, the noblest families, who traced their descent from Kosai, the reputed founder of the city, having their dwellings immediately round the sanctuary. To the north of the Ka’ba was the Dar el-Nadwa, or place of assembly of the Koreish. The multiplication of pilgrimages after Islam soon made it necessary to clear away the nearest dwellings and enlarge the place of prayer around the Ancient House. Omar, Othman and Ibn Jubair had all a share in this work, but the great founder of the mosque in its present form, with its spacious area and deep

1 The old kiswa is removed on the 25th day of the month before the pilgrimage, and fragments of it are bought by the pilgrims as souvenirs. Till the 10th day of the pilgrimage month the Ka’ba is bare.

2 Before Islam the Ka’ba was opened every Monday and Thursday; in the time of Ibn Jubair it was opened with considerable ceremony every Monday and Friday, and daily in the month Rajab. But, though prayer within the building is favoured by the example of the Prophet, it is not compulsory on the Moslem, and even in the time of Ibn Batuta the opportunities of entrance were reduced to Friday and the birthday of the Prophet.

4 Ibn Jubair speaks of fourteen steps, Ali Bey of four, Burckhardt of three. The surrounding ground no doubt has risen so that the Arab naive “hill of Safa” is now inapplicable.
sacrifice, where oaths were administered and hard cases submitted to divine sentence according to the immemorial custom of Semitic shrines. But, besides this, Mecca was already a place of pilgrimage. Pilgrimage with the ancient Arabs was the fulfilment of a vow, which appeared to be generally predominant—at least on the plane of the well-to-do—in a sacrificial feast. A vow of pilgrimage might be directed to other sanctuaries than Mecca—the technical word for it (iḥlāl) is applied, for example, to the pilgrimage to Manāth. The custom followed a form of ceremonial observances of abstinence from certain acts (e.g. hunting) and sexual pleasures, and in particular was forbidden to shear or comb his hair till the fulfilment of the vow. This old Semitic usage has its close parallel in the vow of the Nazarite. It was not peculiarly pronounced, like the fingers of a grafter, but on the return to the city after an absence to present oneself at the sanctuary, and there shave the hair (Muh. in Med., p. 381). Pilgrimages to Mecca were not tied to a single time, but were naturally associated with the Gebrāh month, and the annual feast and market. The pilgrimage was so intimately connected with the wellbeing of Mecca, and had already such a hold on the Arabs round about, that Mahomet could not afford to sacrifice it to another place, and calmly transplanted into Islam in the double form of the omra or vow of pilgrimage to Mecca, which can be discharged at any time, and the bājr or pilgrimage at the great annual feast. The latter closes with a visit to the Ka'ba, but its essential ceremonies are performed at the neighbour shrines where the old Arabs gathered before the Meccan fair. The omra begins at some point outside the Haram (or holy territory), and is performed by every stranger or pilgrim who is not an inhabitant of Mecca. There are no cases for consequences. The ceremony begins by the pilgrim standing before the Ka'ba, and at the neighbour shrines the omra there in the year 10 of the Hegira. The pilgrim enters the Haram in the antique and scanty pilgrimage dress (ihrām), consisting of two cloths wound round his person in a way prescribed by ritual. His devotion is expressed in shouts of "Labbeya" (a word of love for God), and the usages of Islam and the abstinence already referred to is assumed at a considerable distance from the city. But it is also proper during one’s residence in the holy city to perform at least one omra from Tanim in connexion with the imam and that of the non-Arab pilgrim. The rites are ill concealed by the legends of the sa’y of Hagar and of the tawāf being first performed by Adam in imitation of the circuit of the angels about the throne of God; the meaning of their ceremonies has been much lost, almost all the beliefs of whose religion had become a mere formal tradition. We do not even know to what deity the worship expressed in the tawāf was properly addressed. There is a tradition that the Ka'ba was a temple of the ancient Arabs, and hence the omra is a visit to the Ka'ba, but the essential ceremonies are performed outside Mecca, at the neighbour shrines where the old Arabs gathered before the Meccan fair. The omra begins at some point outside the Haram (or holy territory), and is performed by every stranger or pilgrim who is not an inhabitant of Mecca. There are no cases for consequences. and Irāk, the pilgrims who reach Medina from Yanbu and go on to Mecca, and those from all parts of the peninsula. Burckhardt in 1814 estimated the crowd at Arafat at 70,000, Burton in 1853 at 50,000, 'Abd el-Razzāk in 1858 at 60,000. This great assemblage is always a dangerous centre of infection, and the day of Mina especially, spent under circumstances originally adapted only for a Bedouin fair, with no provisions for proper cleanliness, and with the air full of the smell of purifying offal and flesh drying in the sun, produce much sickness.

LITERATURE. Besides the Arabic geographers and cosmographers, we have Ibn 'Abd Rabbīh's description of the mosque, early in the 10th century ('Ibād Pārīd, Cairo ed., iii. 362 sq.), but above all the admirable record of Ibn Jūbih (A.D. 1184), by far the best account extant of how the pilgrimage is performed, as it was shortly before that of Ibn Baṭūṭa. The Arabic historians are largely occupied with fabulous matter as to Mecca before Islām; for these legends the reader may refer to C. de Perceval's Essai. How little confidence can be placed in the pre-Islamic version of history is very forcibly brought out by the second account of Abū Bakr's expedition against the Hejāz, which fell but a few years before the birth of the Prophet, and is the first event in Meccan history which has confirmation from other sources. See Noldeke's version of Tabāri, p. 204 sqq. For the period of the Prophet, Ibn Khīṭāb and Wākidī are valuable sources in topography as well as history. Of the special histories and descriptions of Mecca published by Wüstenfeld (Chroniken der Stadt Mecca, 3 vols., 1857-1858), with an abstract in German, 1861), the most valuable is that of Al-Furqān, a Reflexionsbuch in several books, which, although the oldest part goes back to the beginning of the 9th century, Kuttubeddīn's history (vol. iii. of the Chroniken) goes down with the additions of his nephew to A.D. 1892.

1. MECHANICS. The subject of mechanics may be divided into two parts: (1) theoretical or abstract mechanics, and (2) applied mechanics.

I. THEORETICAL MECHANICS

Historically theoretical mechanics began with the study of practical contrivances such as the lever, and the name mechanics Gr. ἑλμακατάκι, which might more properly be restricted to the theory of mechanisms, and which was indeed used in this narrower sense by Newton, has clung to it, although the subject includes in its purview a far wider field. Previously it has been proposed to adopt the term dynamics (from Gr. δύναμις force,) as including the whole science of the action of force on bodies, whether at rest or in motion. The subject is usually expounded under the two divisions of statics and kinetics, the former dealing with the conditions of rest or equilibrium and the latter with the phenomena of motion as affected by force. To this latter division the old name of dynamics (in a restricted sense) is still often applied. The mere geometrical description and analysis of various types of motion, apart from the consideration of the forces concerned, belongs to kinematics. This is sometimes discussed as a separate theory, but for our present purposes it is more convenient to introduce kinematical motions as they are required. We follow also the traditional practice of dealing first with statics and then with kinetics. This is, in the main, the historical order of development, and for purposes of exposition it has many advantages. The laws of equilibrium are, in fact, necessarily included as a particular case under those of motion; but there is no real inconvenience in formulating as the basis of statics a few provisional postulates which are afterwards seen to be comprehensible in more general schemes.

The whole subject rests ultimately on the Newtonian laws of motion and on some natural extensions of them. As these laws are discussed under a separate heading (Motion, Laws of), it is here only necessary to indicate the standpoint from which the present article is written. It is a purely empirical one. Guided by experience, we are able to frame rules which enable us to say with more or less accuracy what will be the consequences, or what were the antecedents, of a given state of things. These rules are sometimes dignified by the name of laws of nature, but they have relation to our present state of knowledge and to the degree of skill with which we have succeeded in giving more or less compact expression to it. They are therefore liable to be modified from time to time, or to be superseded by more convenient or more comprehensive modes of statement. Again, we do not aim at anything so hopeless, or indeed so useless, as a complete description of any phenomenon. Some features are naturally more important or more interesting to us than others; by their relative simplicity and evident constancy they have the first hold on our attention, whilst those which are apparently accidental and vary from one occasion to another are ignored, or postponed for later examination. It follows that for the purposes of such description as is possible some process of abstraction is inevitable if our statements are to be simple and definite. Thus in studying the flight of a stone through the air we replace the body in imagination by a mathematical point endowed with a mass-coefficient. The size and shape, the complicated spinning motion which it is seen to execute, the internal strains and contractions which doubtless take place, are all sacrificed in the mental picture. In order that the abstraction may be concentrated on those features of the phenomenon which are in the first place most interesting to us. At a later stage in our subject the conception of the ideal rigid body is introduced; this enables us to fill in some details which were previously wanting, but others are still omitted. Again, the conception of a force as concentrated in a mathematical line is as unreal as that of a mass concentrated in a point, but it is a convenient fiction for our purpose, owing to the simplicity which it lends to our statements.

The laws which we are to impose on these ideal representations are in the first instance largely at our choice. Any scheme of abstract dynamics constructed in this way, provided it be self-consistent, is mathematically legitimate; but from the physical point of view we require that it should help us to picture the sequence of phenomena as they actually occur. Its success or failure in this respect can only be judged a posteriori by comparison of the results to which it leads with the facts. It is to be noticed, moreover, that all available tests apply only to the scheme as a whole; owing to the complexity of phenomena we cannot submit any one of its postulates to verification.

It is from this point of view that the question of relativity of motion, which is often felt to be a stumbling-block on the very threshold of the subject, is to be judged. By "motion" we mean of necessity motion relative to some frame of reference which is conventionally spoken of as "fixed." In the earlier stages of our subject this may be any rigid, or apparently rigid, structure fixed relatively to the earth. If we meet with phenomena which do not fit easily into this view, we have the alternatives either to modify our assumed laws of motion, or to call to our aid adventitious forces, or to examine whether the discrepancy can be reconciled by the simpler expedient of a new basis of reference. It is hardly necessary to say that the latter procedure has hitherto been found to be adequate. As a first step we adopt a system of rectangular axes whose origin is fixed in the earth, but whose directions are fixed by relation to the stars; in the planetary theory the origin is transferred to the sun, and afterwards to the mass-centre of the solar system; and so on. At each step there is a gain in accuracy and comprehensiveness; and the conviction is cherished that some system of rectangular axes exists with respect to which the Newtonian scheme holds with all imaginable accuracy.

A similar account might be given of the conception of time as a measurable quantity, but the remarks which it is necessary to make under this head will find a place later.
The following synopsis shows the scheme on which the treatment is based:

1. Statics of a particle.
2. Statics of a system of particles.
3. Plane kinematics of a rigid body.
4. Plane statics.
5. Graphical statics.
7. Three-dimensional kinematics of a rigid body.
8. Three-dimensional statics.
10. Theory of mass-systems.

**Part I.** Statics

§ 1. Statics of a Particle.—By a particle is meant a body whose position can for the purpose in hand be sufficiently specified by a mathematical point. It need not be "infinitely small," or even small compared with ordinary standards; thus in astronomy such vast bodies as the sun, the earth, and the other planets can for many purposes be treated merely as points endowed with mass.

A force is conceived as an effort having a certain direction and a certain magnitude. It is therefore adequately represented, for mathematical purposes, by a straight line AB drawn in the direction in question, of length proportional (on any convenient scale) to the magnitude of the force. In other words, a force is mathematically of the nature of a "vector" (see Vector Analysis, Quaternions). In most questions of pure statics we are concerned only with the ratios of the various forces which enter into the problem, so that it is indifferent what unit of force is adopted. For many purposes a gravitational system of measurement is most natural; thus we speak of a force of so many pounds or so many kilogrammes. The "absolute" system of measurement will be referred to below in Part II, Kinetics. It is to be remembered that all "force" is of the nature of a push or a pull, and that according to the accepted terminology of modern mechanics such phrases as "force of inertia," "accelerating force," "moving force," once classical, are proscribed. This rigorous limitation of the meaning of the word is of comparatively recent origin, and it is perhaps to be regretted that some more technical term has not been devised, but the convention must now be regarded as established.

The fundamental postulate of this part of our subject is that the two forces acting on a particle may be compounded by the "parallelogram rule." Thus, if the two forces \( P, Q \) be represented by the lines OA, OB, they can be replaced by a single force \( \mathbf{R} \) represented by the diagonal OC of the parallelogram determined by OA, OB. This is of course a physical assumption whose propriety is justified solely by experience. We shall see later that it is implied in Newton's statement of his Second Law of motion. In modern language, forces are compounded by "vector-addition"; thus, if we draw in succession vectors \( \mathbf{H}, \mathbf{K}, \mathbf{L} \) to represent \( F, Q \), the force \( \mathbf{R} \) is represented by the vector \( \mathbf{H} \mathbf{L} \) which is the "geometric sum" of \( \mathbf{H}, \mathbf{L} \).

By successive applications of the above rule any number of forces acting on a particle may be replaced by a single force which is the vector-sum of the given forces; this single force is called the resultant. Thus if \( \mathbf{A}, \mathbf{B}, \mathbf{C}, \mathbf{D}, \ldots, \mathbf{K} \) be vectors representing the given forces, the resultant will be given by \( \mathbf{A} \mathbf{K} \). It will be understood that the figure \( \mathbf{A} \mathbf{B} \mathbf{C} \mathbf{D} \ldots \mathbf{K} \) need not be confined to one plane.

If, in particular, the point \( \mathbf{K} \) coincides with \( \mathbf{A} \), so that the resultant vanishes, the given system of forces is said to be in equilibrium—i.e. the particle could remain permanently at rest under its action. This is the proposition known as the polygon of forces. In the particular case of three forces it reduces to the triangle of forces, viz. "If three forces acting on a particle are represented as to magnitude and direction by the sides of a triangle taken in order, they are in equilibrium." A sort of converse proposition is frequently useful, viz. if three forces acting on a particle be in equilibrium, and any triangle be constructed whose sides are respectively parallel to the forces, the magnitudes of the forces will be to one another as the corresponding sides of the triangle. This follows from the fact that all such triangles are necessarily similar.

As a simple example of the geometrical method of treating statical problems we may consider the equilibrium of a particle on a "rough" inclined plane. The usual empirical law of sliding friction is that the mutual action between two plane surfaces in contact, or between a particle and a curved or surface, cannot make with the normal an angle exceeding a certain limit \( \lambda \) called the angle of friction. If the conditions of equilibrium require an obliquity greater than this, sliding will take place. The precise value of \( \lambda \) will vary with the nature and condition of the surfaces in contact. In the case of a body simply resting on an inclined plane, the reaction must of course be vertical, for equilibrium, and the slope \( \alpha \) of the plane must therefore not exceed \( \lambda \). For this reason \( \lambda \) is also known as the angle of repose. If \( \alpha > \lambda \), a force \( P \) must be applied in order to maintain equilibrium; let \( \theta \) be the inclination of \( P \) to the plane, as shown in the left-hand diagram. The relations between this force \( F \), the gravity \( W \) of the body, and the reaction \( S \) of the plane are determined by a triangle of forces \( HKL \). Since the inclination of \( S \) to the normal cannot exceed \( \lambda \) on either side, the value of \( P \) must lie between those limits which are represented by \( L \mathbf{H} \mathbf{L} \), \( L \mathbf{H} \mathbf{K} \), \( L \mathbf{H} \mathbf{K} \). Denoting these limits by \( P_1, P_2 \), we have

\[
P_1/W = L\mathbf{H}/\mathbf{K} = \sin(\alpha - \lambda)/\cos(\theta + \lambda),
\]

\[
P_2/W = L\mathbf{H}/\mathbf{K} = \sin(\alpha - \lambda)/\cos(\theta - \lambda).
\]

It appears, moreover, that if \( \theta \) be varied \( P \) will be least when \( L \mathbf{H} \) is at right angles to \( \mathbf{K} \), in which case \( P_1 = W \sin(\alpha - \lambda) \), corresponding to \( \theta = \lambda \).

Just as two or more forces can be combined into a single resultant, so a single force may be resolved into components.
acting in assigned directions. Thus a force can be uniquely resolved into two components acting in two assigned directions in the same plane with it by an inverse of the parallelogram construction of fig. 1. If, as is usually most convenient, the two assigned directions are at right angles, the two components of a force $P$ will be $P \cos \theta, P \sin \theta$, where $\theta$ is the inclination of $P$ to the direction of the former component. This leads to formulate for the analytical reduction of a system of co-planar forces acting on a particle. Adopting rectangular axes $Ox, Oy$, in the plane of the forces, and distinguishing the various forces of the system by suffixes, we can replace the system by two forces $X, Y$, in the direction of co-ordinate axes; viz.:

$$
X = P \cos \theta_1 + P \cos \theta_2 + \ldots = \Sigma (P \cos \theta),
$$

$$
Y = P \sin \theta_1 + P \sin \theta_2 + \ldots = \Sigma (P \sin \theta).
$$

These two forces $X, Y$, may be combined into a single resultant $R$ making an angle $\phi$ with $Ox$, provided

$$
X = R \cos \phi,
$$

$$
Y = R \sin \phi.
$$

whence

$$
R^2 = X^2 + Y^2,
$$

$$
\tan \phi = Y/X.
$$

Fig. 4.

For equilibrium we must have $R = 0$, which requires $X = 0, Y = 0$; in words, the sum of the components of the system must be zero for each of two perpendicular directions in the plane.

A similar procedure applies to a three-dimensional system, thus if, $O$ being the origin, $OH$ represent any force $P$ of the system, the planes drawn through $H$ parallel to the co-ordinate planes will enclose with the latter a parallelepiped, and it is evident that $OH$ is the geometric sum of $OA, AN, NH, or OA, OB, OC$ in the figure. Hence $P$ is equivalent to three forces $P_1, P_2, P_3$ acting along $Ox, Oy, Oz$, respectively, where $P_1, P_2, P_3$ are the "direction-ratios" of $Ox$. The whole system can be reduced in this way to three forces

$$
X = \Sigma (P_i),
$$

$$
Y = \Sigma (P_m),
$$

$$
Z = \Sigma (P_n),
$$

acting along the co-ordinate axes. These can again be combined into a single resultant $R$ acting in the direction $(\lambda, \mu, \nu)$, provided

$$
X = RA,
$$

$$
Y = RB,
$$

$$
Z = RC.
$$

If the axes are rectilinear, the direction-ratios become direction-cosines, so that $X^2 + \mu^2 + \nu^2 = 1$, whence

$$
R^2 = X^2 + Y^2 + Z^2.
$$

The conditions of equilibrium are $X = 0, Y = 0, Z = 0$.

§ 2. Statics of a System of Particles.—We assume that the mutual forces between the pairs of particles, whatever their nature, are subject to the "Law of Action and Reaction" (Newton's Third Law); i.e. the force exerted by a particle $A$ on a particle $B$, and the force exerted by $B$ on $A$, are equal and opposite in the line $AB$. The problem of determining the possible configurations of equilibrium of a system of particles subject to external forces which are known functions of the positions of the particles, and to internal forces which are known functions of the distances of the pairs of particles between which they act, is in general determinate. For if $n$ be the number of particles, the $3n$ conditions of equilibrium (three for each particle) are equal in number to the $3n$ Cartesian (or other) co-ordinates of the particles, which are to be found. If the system be subject to frictionless constraints, e.g. if some of the particles be constrained to lie on smooth surfaces, or if pairs of particles be connected by inextensible strings, then for each geometrical relation thus introduced we have an unknown reaction (e.g. the pressure of the smooth surface, or

the tension of the string), so that the problem is still determinate.

The case of the funicular polygon will be of use to us later. A number of particles attached at various points of a string are acted on by given extraneous forces $P_1, P_2, P_3, \ldots$ respectively. The relation between the three forces acting on any particle, viz. the extraneous force and the tensions in the two adjacent portions of the string can be exhibited by means of a triangle of forces; and if the successive triangles be drawn to the same scale they can be fitted together so as to constitute a single force-diagram, as shown in fig. 6. This diagram consists of a polygon whose successive sides represent

the given forces $P_1, P_2, P_3, \ldots$, and of a series of lines connecting the vertices with a point $O$. These latter lines measure the tensions in the successive portions of string. As a special, but very important case, the forces $P_1, P_2, P_3, \ldots$ may be parallel, e.g. they may be the weights of the several particles. The polygon of forces is then made up of segments of a vertical line. We note that the tensions have now the same horizontal projection (represented by the dotted line in fig. 7). It is further of interest to note that if the weights are all equal, and at equal horizontal intervals, the vertices of the funicular will lie on a parabola whose axis is vertical. To prove this statement, let $A, B, C, D, \ldots$ be successive vertices, and let $H, K, \ldots$ be the middle points of $AC, BD, \ldots$; then $BH, CK, \ldots$ will be vertical by the hypothesis, and since the geometric sum of $BA, BC$ is represented by $2BH$, the tension in $BA$ is the same at $BC$: weight at $A$ as $BA$: $BC: 2BH$.

The tensions in the successive portions of the string are therefore proportional to the respective lengths, and the lines $BH, CK, \ldots$ are all equal. Hence $AD, BC$ are parallel and are bisected by the same vertical line; and a parabola with vertical axis can therefore be described through $A, B, C, D$. The same holds for the four points $B, C, D, E$ and so on; but since a parabola is uniquely determined by the direction of its axis and by three points on the curve, the successive parabolas $ABCD, BCDE, CDEF \ldots$ must be coincident.

§ 3. Plane Kinematics of a Rigid Body.—The ideal rigid body is one in which the distance between any two points is invariable. For the present we confine ourselves to the consideration of displacements in two dimensions, so that the body is adequately represented by a thin lamina or plate.

The position of a lamina movable in its own plane is determinate when we know the positions of any two points $A, B$ of it. Since the four co-ordinates (Cartesian or other) of these two points are connected by the relation which expresses the invariable of the length $AB$, it is plain that virtually three independent elements are required and suffice to specify the position of the lamina. For instance, the lamina may in general be fixed by connecting any three points of it by rigid links to three fixed points in its plane. The three independent elements may be chosen in a variety of ways (e.g. they may be the lengths
of the three links in the above example). They may be called (in a generalized sense) the co-ordinates of the lamina. The lamina when perfectly free to move in its own plane is said to have three degrees of freedom.

By a theorem due to M. Chasles any displacement whatever of the lamina in its own plane is equivalent to a rotation about some finite or infinitely distant point J. For suppose that in consequence of the displacement a point of the lamina is brought from A to B, whilst the point of the lamina which was originally at B is brought to C. Since AB, BC, are two different positions of the same line in the lamina they are equal, and it is evident that the rotation could have been effected by a rotation about J, the centre of the circle ABC, through an angle AJB. As a special case the three points A, B, C may be in a straight line; J is then at infinity, and the displacement is equivalent to a pure translation, since every point of the lamina is now displaced parallel to AB through a space equal to AB.

Next, consider any continuous motion of the lamina. The latter may be brought from any one of its positions to a neighbouring one by a rotation about the proper centre. The limiting position J of this centre, when the two positions are taken infinitely close to one another, is called the instantaneous centre. If P, P' be consecutive positions of the same point, and the corresponding angle of rotation, then ultimately PP' is at right angles to JP and equal to JP. The instantaneous centre will have a certain locus in space, and a certain locus in the lamina. These two loci are called pole-curves or centrodes, and are sometimes distinguished as the space-centrode and the body-centrode, respectively. In the continuous motion in question the latter curve rolls without slipping on the former (M. Chasles). Consider in fact any series of successive positions of the lamina (fig. 11); and let J₁, J₂, J₃, . . . be the positions in space of the centrodes of the rotations by which the lamina can be brought from the first position to the second, from the second to the third, and so on. Further, in the position 1, let J₁, J₂, J₃, . . . be the points of the lamina which have become the successive centres of rotation. The given series of positions will be assumed in succession if we imagine the lamina to rotate first about J₁ until J₂ comes into coincidence with J₁, then about J₂ until J₃ comes into coincidence with J₂, and so on. This is equivalent to imagining the lamina, supposed fixed in the lamina, to roll on the polygon J₁ J₂ J₃ . . ., which is supposed fixed in space. By imagining the successive positions to be taken infinitely close to one another we derive the theorem stated. The particular case where both centrodes are circles is specially important in mechanics.

The theory may be illustrated by the case of "three-bar motion." Let ABCD be any quadrilateral formed of jointed links. If AB be held fixed, the quadrilateral be slightly deformed, it is obvious that the instantaneous centre J will be at the intersection of the straight lines AD, BC, since the displacements of the points D, C are necessarily at right angles to AD, BC, respectively. Hence these displacements are proportional to AD, BC, and therefore to DD', CC', where C'D' is any line drawn parallel to CD meeting BC, AD in C', D', respectively.

The determination of the centrodes in three-bar motion is in general complicated, but in one case, that of the "crossed parallelogram" (fig. 13), they assume simple forms. We then have AB=DC and AD=BC, and from the symmetries of the figure it is plain that

$$AJ + JB = CJ + JD = AD.$$  

Hence the locus of J relative to AB, and the locus relative to CD are equal ellipses of which A, B and C, D are respectively the foci. It may be noticed that the lamina in fig. 9 is not, strictly speaking, fixed, but admits of infinitesimal displacement, whenever the directions of the three links are concurrent (or parallel).

The matter may of course be treated analytically, but we shall only require the formula for infinitely small displacements. If the origin of rectangular axes fixed in the lamina be shifted through a space whose projections on the original directions of the axes are $\lambda$, $\mu$, and if the axes are simultaneously turned through an angle $\theta$, the co-ordinates of a point of the lamina, relative to the original axes, are changed from $x$, $y$ to $\lambda x + \cos \theta - y \sin \theta$, $\mu + x \sin \theta + y \cos \theta$, or $\lambda + x - y \theta$, $\mu + x \theta + y \theta$, ultimately. Hence the component displacements are ultimately

$$dx = \lambda - ye, dy = \mu + xe.$$  

If we equate these to zero we get the co-ordinates of the instantaneous centre.

§ 4. Plane Statics.—The statics of a rigid body rests on the following two assumptions:

(i) A force may be supposed to be applied indifferently at any point in its line of action. In other words, a force is of the nature of a "bound" or "localized" vector; it is regarded as resident in a certain line, but has no special reference to any particular point of the line.

(ii) Two forces in intersecting lines may be replaced by a single force which is their geometric sum, acting through the intersection. The theory of parallel forces is included as a limiting case. For if O, A, B be any three points, and $m$, $n$ any scalar quantities, we have in vectors

$$m \vec{OA} + n \vec{OB} = (m + n) \vec{OC}.$$  

provided

$$m \vec{CA} + n \vec{CB} = \vec{0}.$$  

Hence if forces $P$, $Q$ act in $OA$, $OB$, the resultant $R$ will pass through $C$, provided

$$m = P/OA, \quad n = Q/OB;$$

also

$$R = P \cdot OC/OA + Q \cdot OC/OB,$$

and

$$P \cdot AC = Q \cdot CB = OA \cdot OB.$$  

These formulae give a means of constructing the resultant by means of any transverse AB cutting the lines of action. If we now imagine the point $O$ to recede to infinity, the forces $P$, $Q$ and the resultant $R$ are parallel, and we have

$$R = P + Q, \quad P \cdot AC = Q \cdot CB.$$  

When $P$, $Q$ have opposite signs the point $C$ divides $AB$ externally on the side of the greater force. The investigation fails when $P + Q = 0$, since it leads to an infinitely small resultant acting in an infinitely distant line. A combination of two equal, parallel, but oppositely directed forces cannot in fact be replaced by anything simpler, and must therefore be recognized as an independent entity in statics. It was called by Poinsot, who first systematically investigated its properties, a couple.

We now restrict ourselves for the present to the systems of forces in one plane. By successive applications of (ii) any
such coplanar system can in general be reduced to a single resultant acting in a definite line. As exceptional cases the system may reduce to a couple, or it may be in equilibrium.

The moment of a force about a point O is the product of the force into the perpendicular drawn to its line of action from O, this perpendicular being reckoned positive or negative according as O lies on one side or other of the line of action. If we mark off a segment AB along the line of action so as to represent the force completely, the moment is represented as to magnitude by twice the area of the triangle OAB, and the usual convention as to sign is that it is to be reckoned positive or negative according as the letters O, A, B, occur in “counter-clockwise” or “clockwise” order.

The sum of the moments of two forces about any point O is equal to the moment of their resultant (P. Varignon, 1687). Let AB, AC (fig. 16) represent the two forces, AD, their resultant; we have to prove that the sum of the triangles OAB, OAC is equal to the triangle OAD, regard being had to signs. Since the side OA is common, we have to prove that the sum of the perpendiculars from B and C on OA is equal to the perpendicular from D on OA, these perpendiculars being reckoned positive or negative according as they lie to the right or left of AO.

Regarded as a statement concerning the orthogonal projections of the vectors AB and AC (or BD), and of their sum AD, on a line perpendicular to AO, this is obvious.

It is now evident that in the process of reduction of a coplanar system no change is made at any stage either in the sum of the projections of the forces on any line or in the sum of their moments about any point. It follows that the single resultant to which the system in general reduces is uniquely determinate, i.e. it acts in a definite line and has a definite magnitude and sense. Again it is necessary and sufficient for equilibrium that the sum of the projections of the forces on each of two perpendicular directions should vanish, and (moreover) that the sum of the moments about some one point should be zero. The fact that three independent conditions must hold for equilibrium is important. The conditions may of course be expressed in different (but equivalent) forms; e.g. the sum of the moments of the forces about each of the three points which are not collinear must be zero.

The particular case of three forces is of interest. If they are not all parallel they must be concurrent, and their vector-sum must be zero. Thus three forces acting perpendicular to the sides of a triangle at the middle points will be in equilibrium provided they are proportional to the respective sides, and act all inwards or all outwards. This result is easily extended to the case of a polygon of any number of sides; it has an important application in hydrostatics.

Again, suppose we have a bar AB resting with its ends on two smooth inclined planes which face each other. Let G be the centre of gravity (§ 11), and let AG = a, GB = b. Let a, b be the inclinations of the planes, and the angle which the bar makes with the vertical. The position of equilibrium is determined by the consideration that the reactions at A and B, which are by hypothesis normal to the planes, must meet at a point J on the vertical through G. Hence

\[ \frac{JG}{a} = \sin (\theta - \alpha)/\sin \alpha, \quad \frac{JG}{b} = \sin (\theta + \beta)/\sin \beta, \]

whence

\[ \cot \theta = \frac{a \cot a - b \cot b}{a + b}. \]  

(6)

If the bar is uniform we have \( a = b \), and

\[ \cot \theta = \frac{1}{2} (\cot a - \cot b). \]  

(7)

The problem of a rod suspended by strings attached to two points of it is virtually identical, the tensions of the strings taking the place of the reactions of the planes.

Just as a system of forces is in general equivalent to a single force, so a given force can conversely be replaced by combinations of other forces, in various ways. For instance, a given force (and consequently a system of forces) can be replaced in one and only one way by three forces acting in three assigned straight lines, provided these lines be not concurrent or parallel. Thus if the three lines form a triangle ABC, and if the given force F meet BC in H, then F can be resolved into two components acting in HA, BC, respectively. And the force in HA can be resolved into two components acting in BC, CA, respectively. A simple graphical construction is indicated in fig. 19, where the dotted lines are parallel. As an example, any system of forces acting on the lamina in fig. 9 is balanced by three determinate tensions (or thrusts) in the three links, provided the directions of the latter are not concurrent.

If P, Q, R, be any three forces acting along BC, CA, AB, respectively, the line of action of the resultant is determined by the consideration that the sum of the moments about any point on it must vanish. Hence in "trilinear" co-ordinates, with ABC as fundamental triangle, its equation is \( Pa + Qb + Rc = 0 \). If \( P + Q + R = 0 \), \( P + Q + R = 0 \), this sum is called the moment of the couple; it must of course have the proper sign attributed to it. It easily follows that any two couples of the same moment are equivalent, and that any number of couples can be replaced by a single couple whose moment is the sum of their moments. Since a couple is for our purposes sufficiently represented by its moment, it has been proposed to substitute the name torque (or twisting effort), as free from the suggestion of any special pair of forces.

A system of forces represented completely by the sides of a plane polygon taken in order is equivalent to a couple whose
moment is represented by twice the area of the polygon; this is proved by taking moments about any point. If the polygon intersects itself, care must be taken to attribute to the different parts of the area their proper signs.

The formal analytical reduction of a system of coplanar forces is as follows. Let \((x_1, y_1), (x_2, y_2), \ldots\) be the rectangular co-ordinates of any points \(A_1, A_2, \ldots\) on the lines of action of the respective forces. The force at \(A_1\) may be replaced by its components \(X_1, Y_1\), parallel to the co-ordinate axes; that at \(A_2\) by its components \(X_2, Y_2\), and so on. Introducing at \(O\) two equal and opposite forces \(-X_1\) in \(Ox\), we see that \(X_1\) at \(A_1\) may be replaced by an equal and parallel force at \(O\) together with a couple \(-Y_1\). Similarly the force \(Y_1\) at \(A_1\) may be replaced by a force \(Y_1\) at \(O\) together with a couple \(-X_1\). The forces \(X_1, Y_1\), at \(O\) can thus be transferred to \(O\) provided we introduce a couple \(x_1Y_1\). Treating the remaining forces in the same way we get a force \(X_1 + X_2 + \ldots\) or \(\Sigma(X)\) along \(Ox\), a force \(Y_1 + Y_2 + \ldots\) or \(\Sigma(Y)\) along \(Oy\), and a couple \((x_1Y_1 - y_1X_1) + (x_2Y_2 - y_2X_2) + \ldots\) or \(\Sigma(xY - yX)\). The three conditions of equilibrium are therefore

\[
\Sigma(X) = 0, \quad \Sigma(Y) = 0, \quad \Sigma(xY - yX) = 0. \tag{8}
\]

If \(O^\prime\) be a point whose co-ordinates are \((\xi, \eta)\), the moment of the couple when the forces are transferred to \(O^\prime\) as a new origin will be \(\Sigma(x - \xi)Y - (y - \eta)X\). This vanishes, i.e. the system reduces to a single resultant through \(O^\prime\), provided

\[
\xi \Sigma(Y) + \eta \Sigma(X) + \Sigma(xY - yX) = 0. \tag{9}
\]

If \(\xi, \eta\) be regarded as current co-ordinates, this is the equation of the line of action of the single resultant to which the system is in general reducible.

If the forces are all parallel, making say an angle \(\theta\) with \(Ox\), we may write \(X_1 = P_1 \cos \theta, \ Y_1 = P_1 \sin \theta, \ X_2 = P_2 \cos \theta, \ Y_2 = P_2 \sin \theta, \ldots\). The equation (9) then becomes

\[
(\Sigma(xP)) \sin \theta - (\Sigma(yP)) \cos \theta = 0. \tag{10}
\]

If the forces \(P_1, P_2, \ldots\) be turned in the same sense through the same angle about the respective points \(A_1, A_2, \ldots\) so as to remain parallel, the value of \(\theta\) is alone altered, and the resultant \(\Sigma(P)\) passes always through the point

\[
\xi = \Sigma(xP)/\Sigma(P), \quad \eta = \Sigma(yP)/\Sigma(P), \tag{11}
\]

which is determined solely by the configuration of the points \(A_1, A_2, \ldots\) and by the ratios \(P_1; P_2; \ldots\) of the forces acting at them respectively. This point is called the centre of the given system of parallel forces; it is finite and determinate unless \(\Sigma(P) = 0\). A geometrical proof of this theorem, which is not restricted to a two-dimensional system, is given later (§11). It contains the theory of the centre of gravity as ordinarily understood. For if we have an assemblage of particles whose mutual distances are small compared with the dimensions of the earth, the forces of gravity on them constitute a system of sensibly parallel forces, sensibly proportional to the respective masses. If now the assemblage be brought into any other position relative to the earth, without alteration of the mutual distances, this is equivalent to a rotation of the directions of the forces relatively to the assemblage, the ratios of the forces remaining unaltered. Hence there is a certain point, fixed relatively to the assemblage, through which the resultant of gravitational action always passes; this resultant is moreover equal to the sum of the forces on the several particles.

The theorem that any coplanar system of forces can be reduced to a force acting through any assigned point, together with a couple, has an important illustration in the theory of the distribution of shearing stress and bending moment in a horizontal beam, or other structure, subject to vertical extraneous forces. If we consider any vertical section \(P\), the forces exerted across the section by the portion of the structure on one side on the portion on the other may be reduced to a vertical force \(F\) at \(P\) and a couple \(M\). The force measures the shearing stress, and the couple the bending moment at \(P\); we reckon these quantities positive when the senses are as indicated in the figure.

If the remaining forces acting on the portion of the structure on either side of \(P\) are known, then resolving vertically we find \(F\), and taking moments about \(P\) we find \(M\). Again if \(PQ\) be any segment of the beam which is free from load, \(Q\) lying to the right of \(P\), we find

\[
F_P - F_Q = -W, \quad M_P - M_Q = -FQ^2. \tag{12}
\]

hence \(F\) is constant between the loads, whilst \(M\) decreases as we travel to the right, with a constant gradient \(-F\). If \(PQ\) be a short segment containing an isolated load \(W\), we have

\[
F_P - F_Q = -W, \quad M_P - M_Q = W. \tag{13}
\]

hence \(F\) is discontinuous at a concentrated load, diminishing by an amount equal to the load as we pass the loaded point to the right, whilst \(M\) is continuous. Accordingly the graph of \(F\) for any system of isolated loads will consist of a series of horizontal lines, whilst that of \(M\) will be a continuous polygon.

To pass to the case of continuous loads, let \(x\) be measured horizontally along the beam to the right. The load on an element \(dx\) of the beam may be represented by \(w\), where \(w\) is in general a function of \(x\). The equations (12) are now replaced by

\[
\delta F = -w dx, \quad \delta M = -F dx. \tag{14}
\]

The latter relation shows that the bending moment varies as the area cut off by the ordinate in the graph of \(F\). In the case of uniform load we have

\[
F = -w x + A, \quad M = \frac{1}{2}w x^2 + Ax + B, \tag{15}
\]

where the arbitrary constants \(A, B\) are to be determined by the conditions of the special problem, e.g. the conditions at the ends of the beam. The graph of \(F\) is a straight line; that of \(M\) is a parabola with vertical axis. In all cases the graphs due to different distributions of load may be superposed. The figure shows the case of a uniform heavy beam supported at its ends.

The graphical method of reducing a plane system of forces was introduced by C. Culmann (1864). It involves the construction of two figures, a force-diagram and a funicular polygon. The force-diagram is constructed by placing end to end a series of vectors representing the given forces in
mechanics and direction, and joining the vertices of the polygon thus formed to an arbitrary pole O. The funicular or link polygon has its vertices on the lines of action of the given forces, and its sides respectively parallel to the lines drawn from O in the force-diagram; in particular, the two sides meeting in any vertex are respectively parallel to the lines drawn from O to the ends of that side of the force-polygon which represents the corresponding force. The relations will be understood from the annexed diagram, where corresponding lines in the force-diagram (to the right) and the funicular (to the left) are numbered similarly.

The sides of the force-polygon may in the first instance be arranged in any order; the force-diagram can then be completed in a doubly infinite number of ways, owing to the arbitrary position of O; and for each force-diagram a simply infinite number of funiculars can be drawn. The two diagrams being supposed constructed, it is seen that each of the given systems of forces can be replaced by two components acting in the sides of the funicular which meet at the corresponding vertex, and that the magnitudes of these components will be given by the corresponding triangle of forces in the force-diagram; thus the force r in the figure is equivalent to two forces represented by O't and 02'. When this process of replacement is complete, each terminated side of the funicular is the seat of two forces which neutralize one another, and there remain only two uncompensated forces, viz., those resident in the first and last sides of the funicular. If these sides intersect, the resultant acts through the intersection, and its magnitude and direction are given by the line joining the first and last sides of the force-polygon (see fig. 26, where the resultant of the four given forces is denoted by R). As a special case it may happen that the force-polygon is closed, i.e., its first and last points coincide; the first and last sides of the funicular will then be parallel (unless they coincide), and the two uncompensated forces form a couple. If, however, the first and last sides of the funicular coincide, the two outstanding forces neutralize one another, and we have equilibrium. Hence the necessary and sufficient conditions of equilibrium are that the force-polygon and the funicular should both be closed. This is illustrated by fig. 26 if we imagine the force R, reversed, to be included in the system of given forces.

It is evident that a system of joinders bars having the shape of the funicular polygon would be in equilibrium under the action of the given forces, supposed applied to the joints; moreover any bar in which the stress is of the nature of a tension (as distinguished from a thrust) might be replaced by a string. This is the origin of the names "link-polygon" and "funicular" (cf. § 2).

If funiculars be drawn for two positions O, O' of the pole in the force-diagram, their corresponding sides will intersect on a straight line parallel to OO'. This is essentially a theorem of projective geometry, but the following statistical proof is interesting. Let AB (fig. 27) be any side of the force-polygon, and construct the corresponding portions of the two diagrams, first with O and then with O' as pole. The force corresponding to AB may be replaced by the two components marked x, y; and a force corresponding to BA may be represented by the two components marked x', y'. Hence the forces x, y, x', y' are in equilibrium. Now x, x' have a resultant through H, represented in magnitude and direction by O'O; whilst y, y' have a resultant through K represented in magnitude and direction by O'O. Hence HK must be parallel to O'O. This theorem enables us, when one funicular has been drawn, to construct another without further reference to the force-diagram.

The complete figures obtained by drawing first the force-diagrams of a system of forces in equilibrium with two distinct poles O, O', and secondly the corresponding funiculars, have various interesting relations. In the first place, each of these figures may be conceived as an orthogonal projection of a closed plane-faced polyhedron. As regards the former figure this is evident at once; viz. the polyhedron consists of two pyramids with vertices represented by O, O', and a common base whose perimeter is represented by the force-polygon (only one of these is shown in fig. 28). As regards the funicular diagram, let LM be the line on which the pairs of corresponding sides of the two polygons meet, and through LM draw any two planes ω, ω'. Through the vertices A, B, C, ... and A', B', C', ... of the two funiculars draw normals to the plane of the diagram to meet ω and ω' respectively. The points thus obtained are evidently the vertices of a polyhedron with plane faces.

To every line in either of the original figures corresponds of course a parallel line in the other; moreover, it is seen that concurrent lines in either figure correspond to lines forming a closed polygon in the other. Two plane figures so related are called reciprocal, since the properties of the first figure in relation to the second are the same as those of the second with respect to the first. A still simpler instance of reciprocal figures is supplied by the case of concurrent forces in equilibrium (fig. 29). The theory of these reciprocal figures was first studied by J. Clerk Maxwell, who showed amongst other things that a reciprocal can always be drawn to any figure which is the orthogonal projection of a plane-faced polyhedron. If in fact we take the pole of each face of such a polyhedron with respect to a paraboloid of revolution, these poles will be the vertices of a second polyhedron whose edges are the "conjugate lines" of those of the former. If we project both polyhedra orthogonally on a plane perpendicular to the axis of the paraboloid, we obtain two figures which are reciprocal, except that corresponding lines are orthogonal instead of parallel. Another proof will be indicated later (§ 8) in connexion with the properties of the linear complex. It is
MECHANICS

In structural applications a frame must be stiff, or rigid, i.e. it must be incapable of deformation without alteration of length in at least one of its bars. It is said to be just rigid if it ceases to be rigid when any one of its bars is removed. A frame which has more bars than are essential for rigidity may be called over-rigid; such a frame is in general self-stressed, i.e. it is in a state of stress independently of the action of extraneous forces. A plane frame of \( n \) joints which is just rigid (as regards deformation in its own plane) has \( 2n - 3 \) bars, for if one bar be held fixed the \( 2(n-2) \) co-ordinates of the remaining \( n - 2 \) joints must just be determined by the lengths of the remaining bars. The total number of bars is therefore \( 2(n-2) + 1 \). When a plane frame which is just rigid is subject to a given system of equilibrating extraneous forces (in its own plane) acting on the joints, the stresses in the bars are in general uniquely determinate. For the conditions of equilibrium of the forces on each pin furnish \( 2n \) equations, viz. two for each point, which are linear in respect of the stresses and the extraneous forces. This system of equations must involve the three conditions of equilibrium of the extraneous forces which are already ideitically satisfied, by hypothesis; there remain therefore \( 2n - 3 \) independent relations to determine the \( 2n - 3 \) unknown stresses. A frame of \( n \) joints and \( 2n - 3 \) bars may of course fail to be rigid owing to some parts being over-stiff whilst others are deformable; in such a case it will be found that the statistical equations, apart from the three identical relations imposed by the equilibrium of the extraneous forces, are not all independent but are equivalent to less than \( 2n - 3 \) relations. Another exceptional case, known as the critical case, will be noticed later (§ 6).

A plane frame which can be built up from a single bar by successive steps, at each of which a new joint is introduced by two
new bars meeting there, is called a simple frame; it is obviously just rigid. The stresses produced by extraneous forces in a simple frame can be found by considering the equilibrium of the various joints in a proper succession; and if the graphical method be employed the various polygons of force can be combined into a single force-diagram. This procedure was introduced by W. J. M. Rankine and J. Clerk Maxwell (1864). It may be noticed that if we take an arbitrary pole in the force-diagram, and draw a corresponding horizontal in the skeleton diagram which represents the frame together with the lines of action of the extraneous forces, we obtain two complete reciprocal figures, in Maxwell's sense. It is accordingly convenient to use Bow's notation (§ 3), and to distinguish the several compartments of the frame-diagram by letters. See fig. 33, where the successive triangles in the diagram of forces may be constructed in the order XYZ, XZ, AY, AZB. The class of "simple" frames includes many of the frameworks used in the construction of roofs, lattice girders and suspension bridges; a number of examples will be found in the article Bridges. By examining the senses in which the respective forces act at each joint we can ascertain which members are in tension and which are in thrust; in fig. 33 this is indicated by the directions of the arrowheads.

When a frame, though just rigid, is not "simple" in the above sense, the preceding method must be replaced, or supplemented, by one or other of various articifacies. In some cases the method of sections is sufficient for the purpose. If an ideal section be drawn across the frame, the extraneous forces on either side must be in equilibrium with the forces in the bars cut across; and if the section can be drawn so as to cut only three bars, the forces in these can be found, since the problem reduces to that of resolving a given force into three components acting in three given lines (§ 4). The "critical case" where the directions of the three bars are concurrent is of course excluded. Another method, always available, will be explained under "Work" (§ 9).

When extraneous forces act on the bars themselves the stress in each bar no longer consists of a simple longitudinal tension or thrust. To find the reactions at the joints we may proceed as follows. Each extraneous force W acting on a bar may be replaced (in an infinite number of ways) by two components P, Q in lines through the centres of the pins at the extremities. In practice the forces W are usually vertical, and the components P, Q are then conveniently taken to be vertical also. We first alter the problem by transferring the forces P, Q to the pins. The stresses in the bars, in the problem as thus modified, may be supposed found by the preceding methods; it remains to infer from the results thus obtained the reactions in the original form of the problem. To find the pressure exerted by a bar AB on the pin A we compound with the force in AB given by the diagram a force equal to P. Conversely, to find the pressure of the pin A on the bar AB we must compound with the force given by the diagram a force equal and opposite to P. This question arises in practice in the theory of "three-jointed" structures; for the purpose in hand such a structure is sufficiently represented by two bars AB, BC. The right-hand figure represents a portion of the force-diagram; in particular XZ represents the pressure of AB on B in the modified problem where the loads W1 and W2 on the two bars are replaced by loads P1, Q1, and P2, Q2 respectively, acting on the pins. Compounding with this XV which represents Q1, we get the actual pressure ZV exerted by AB on B. The directions and magnitudes of the reactions at A and C are then easily ascertained. On account of its practical importance several other graphical solutions of this problem have been devised.

§ 7. Three-dimensional Kinematics of a Rigid Body.—The position of a rigid body is determined when we know the positions of three points A, B, C of which are not collinear, for the position of any other point P is then determined by the three distances PA, PB, PC. The nine co-ordinates (Cartesian or other) of A, B, C are subject to the three relations which express the invariance of the distances BC, CA, AB, and are therefore equivalent to six independent quantities. Hence a rigid body not constrained in any way is said to have six degrees of freedom. Conversely, any six geometrical relations restrict the body in general to one or other of a series of definite positions, none of which can be departed from without violating the conditions in question. For instance, the position of a theodolite is fixed by the fact that its rounded feet rest in contact with six given plane surfaces. Again, a rigid three-dimensional frame can be rigidly fixed relatively to the earth by means of six links.

The six independent quantities, or "co-ordinates," which serve to specify the position of a rigid body in space may of course be chosen in an endless variety of ways. We may, for instance, employ the three Cartesian co-ordinates of a particular point O of the body, and three angular co-ordinates which express the orientation of the body with respect to O. Thus in fig. 36, if OA, OB, OC be the mutually perpendicular lines in the solid, we may denote by \( \theta \) the angle which OC makes with a fixed direction OZ, by \( \psi \) the azimuth of the plane ZOC measured from some fixed plane through OZ, and by \( \phi \) the inclination of the plane COA to the plane ZOC. In fig. 36 these various lines and planes are represented by their intersections with a unit sphere having O as centre. This very useful, although unsymmetrical, system of angular co-ordinates was introduced by L. Euler. It is exemplified in "Cardan's suspension," as used in connexion with a compass-bowl or a gyroscope. Thus in the gyroscope the "flywheel" (represented by the globe in fig. 37) can turn about a diameter OC of a ring which is itself free to turn about a diametral axis OX at right angles to the former; this axis is carried by a second ring which is free to turn about a fixed diameter OZ, which is at right angles to OX.

We proceed to sketch the theory of the finite displacements of a rigid body. It was shown by Euler (1776) that any displacement
in which one point O of the body is fixed is equivalent to a pure rotation about some axis through O. Imagine two spheres of equal radius with O as their common centre, one fixed in the body and moving with it, the other fixed in space. In any displacement about O as a fixed point, the former sphere slides over the latter, as in a “ball-and-socket” joint. Suppose that as the result of the displacement a point of the moving sphere is brought from A to B, whilst the point which was at B is brought to C (cf. fig. 10). Let J be the pole of the circle ABC (usually a “small circle” of the fixed sphere), and join JA, JB, JC, AB, BC by great-circle arcs. The spherical isosceles triangles AJB, BJc are congruent, and we see that AB can be brought into the position BC by a rotation about the axis OJ through an angle AJB.

It is convenient to distinguish the two senses in which rotation may take place about an axis OA by opposite signs. We shall reckon a rotation as positive when it is related to the direction from O to A as the direction of rotation is related to that of translation in a right-handed screw. Thus a negative rotation about OA may be regarded as a positive rotation about OA’, the prolongation of AO. Now suppose that a body receives first a positive rotation a about OA, and secondly a positive rotation b about OB; and let A, B be the intersections of these axes with a sphere described about O as centre. If we construct the spherical triangles ABC, ABC’ (fig. 38), having in each case the angles at A and B equal to a and b respectively, it is evident that the first rotation will bring a point from C to C’ and that the second will bring it back to C; the result is therefore equivalent to a rotation about OC. We note also that if the given rotations had been effected in the inverse order, the axis of the resultant rotation would have been OC’, so that finite rotations do not obey the “commutative law.” To find the angle of the equivalent rotation, in the actual case, suppose that the second rotation (about OB) brings a point from A to A’. The spherical triangles ABC, A’BC (fig. 39) are “symmetrically equal,” and the angle of the resultant rotation, viz. ACA’, is π − α. This is equivalent to a negative rotation 2γ about OC, whence the theorem that the effect of three successive positive rotations 2α, 2β, 2γ about OA, OB, OC respectively, is to leave the body in its original position, provided the circuit ABC is left-handed as seen from O. This theorem is due to O. Rodrigues (1840).

The composition of finite rotations about parallel axes is a particular case of the preceding; the radius of the sphere is now infinite, and the triangles are plane.

In any continuous motion of a solid about a fixed point O, the limiting position of the axis of the rotation by which the body can be brought from any one of its positions to a consecutive one is called the instantaneous axis. This axis traces out a certain cone in the body, and a certain cone in space, and the continuous motion in question may be represented as consisting in a rolling of the former cone on the latter. The proof is similar to that of the corresponding theorem of plane kinematics (§ 3).

It follows from Euler’s theorem that the most general displacement of a rigid body may be effected by a pure translation which brings any one point of it to its final position O, followed by a pure rotation about some axis through O. Those planes in the body which are perpendicular to this axis obviously remain parallel to their original positions. Hence, if σ, σ’ denote the initial and final positions of any figure in one of these planes, the displacement could evidently have been effected by (1) a translation perpendicular to the planes in question, bringing σ into some position σ’ in the plane of σ, and (2) a rotation about a normal to the planes, bringing σ’ into coincidence with σ (§ 3).

In other words, the most general displacement is equivalent to a translation parallel to a certain axis combined with a rotation about that axis; i.e. it may be described as a twist about a certain screw. In particular cases, of course, the translation, or the rotation, may vanish.

The preceding theorem, which is due to Michel Chasles (1830), may be proved in various other interesting ways. Thus if a point of the body be displaced from A to B, whilst the point which was at B was brought to C, and that which was at C to D, the four points A, B, C, D lie on a helix whose axis is the common perpendicular to the bisectors of the angles ABC, BCD. This is the axis of the required screw; the amount of the translation is measured by the projection of AB or BC or CD on the axis; and the angle of rotation is given by the inclination of the aforesaid bisectors. This construction was given by M. W. Crofton. Again, H. Wiener and W. Burnside have employed the half-turn (i.e. a rotation through two right angles) as the fundamental operation. This has the advantage that it is completely specified by the axis of the rotation, the sense being immaterial. Successive half-turns about parallel axes a, b are equivalent to a translation measured by double the distance between these axes in the direction from a to b. Successive half-turns about intersecting axes a, b are equivalent to a rotation about the common perpendicular to a, b at the intersection of a and b, amount equal to twice the acute angle between them, in the direction from a to b. Successive half-turns about skew axes a, b are equivalent to a twist about a screw whose axis is the common perpendicular to a, b, the translation being double the shortest distance, and the angle of rotation being twice the acute angle between a and b, in the direction from a to b. It is easily shown that any displacement whatever is equivalent to two half-turns and therefore to a screw.

In mechanics we are specially concerned with the theory of infinitesimal displacements. This is included in the preceding, but it is simpler in that the various operations are commutative. An infinitesimally small rotation about any axis is conveniently represented geometrically by a length AB measures along the axis and proportional to the angle of rotation, with the convention that the direction from A to B shall be related to the rotation as is the direction of translation to that of rotation in a right-handed screw. The consequent displacement of any point P will then be at right angles to the plane PAB, its amount will be represented by double the area of the triangle PAB, and its sense will depend on the cyclical order of the letters P, A, B. If AB, AC represent infinitesimal rotations about intersecting axes, the consequent displacement of any point O in the plane ABC will be at right angles to this plane, and will be represented by twice the sum of the areas OAB, OAC, with proper signs. It follows by analogy with the theory of moments (§ 4) that the resultant rotation will be represented by AD, the vector-sum of AB, AC (see fig. 16). It is easily inferred as a limiting case, or proved directly, that two infinitesimal rotations a, b about parallel axes are equivalent to a rotation a + b about a parallel axis in the same plane with the two former, and dividing a common perpendicular AB in a point C so that AC/CB = b/a. If the rotations are equal and opposite, so that a + b = 0, the point C is at infinity, and the effect is a translation perpendicular to the plane of the two given axes, of amount a. AB. It thus appears that an infinitesimal rotation is of the nature of a “localized translation,” and is subject in all respects to the same mathematical laws as a force, conceived as acting on a rigid body. Moreover, that an infinitesimal translation is analogous to a couple and follows the same laws. These results are due to Poinsot.

The analytical treatment of small displacements is as follows. We first suppose that one point O of the body is fixed, and take this as the origin of a “right-handed” system of rectangular...
co-ordinates; i.e. the positive directions of the axes are assumed to be so arranged that a positive rotation of \(90^\circ\) about \(Ox\) would bring \(Oy\) into the position of \(Oz\), and so on. The displacement will consist of an infinitesimal rotation \(\varepsilon\) about some axis through \(O\), whose direction-cosines are, \(l, m, n\). From the equivalence of a small rotation to a localized vector it follows that the rotation \(\varepsilon\) will be equivalent to rotations \(\xi, \eta, \zeta\) about \(Ox, Oy, Oz\), respectively, provided

\[ \xi = l\varepsilon, \eta = m\varepsilon, \zeta = n\varepsilon, \]

and we note that

\[ \xi^2 + \eta^2 + \zeta^2 = \varepsilon^2. \]  

Thus in the case of fig. 36 it may be required to connect the infinitesimal rotations \(\xi, \eta, \zeta\) about \(OA, OB, OC\) with the variations of the angular co-ordinates \(\theta, \phi, \psi\). The displacement of the point \(C\) of the body is made up of \(60^\circ\) tangential to the meridian \(ZC\) and \(sin \phi\) perpendicular to the plane of this meridian. Hence, solving along the tangents to the axes \(BC, CA\), respectively, we have

\[ \xi = 60 \sin \phi - sin \theta \cos \phi, \eta = 60 \cos \phi + sin \theta \cos \phi. \]  

Again, consider the point of the solid which was initially at \(A\) in the figure. This is displaced relatively to \(A\) through a space \(6\phi\) perpendicular to the plane of the meridian, whilst \(A\) itself is displaced through a space \(cos \phi \phi\) in the same direction. Hence

\[ \xi = 6\phi + cos \theta \phi. \]  

To find the component displacements of a point \(P\) of the body, whose co-ordinates are \(x, y, z\), we draw \(PL\) normal to the plane \(Oy\), and \(LH, LK\) perpendicular to \(Oy, Oz\), respectively. The displacement of \(P\) parallel to \(Ox\) is the same as that of \(L\), which is made up of \(\xi\) and \(-\eta\). In this way we obtain the formulae

\[ \Delta x = \xi - \nu, \Delta y = \mu - \xi, \Delta z = \eta - \nu. \]

The most general case is derived from this by adding the component displacements \(\lambda, \mu, \nu\) (say) of \(O\) to \(P\); thus

\[ \Delta x = \lambda + \xi - \nu, \Delta y = \mu + \xi - \nu, \Delta z = \nu + \xi - \nu. \]

The displacement is thus expressed in terms of the six independent quantities \(\xi, \eta, \zeta, \lambda, \mu, \nu\). The points whose displacements are in the direction of the resultant axis of rotation are determined by \(\Delta x, \Delta y, \Delta z\); or

\[ (\lambda + \xi - \nu)t, (\mu + \xi - \nu)t, (\nu + \xi - \nu)t. \]

These are the equations of a straight line, and the displacement is in fact equivalent to a twist about a screw having this line as axis. The translation parallel to this axis is

\[ \Delta x = \mu + \nu + \Delta x = (\lambda + \xi + \mu + \nu)t. \]

The linear magnitude which measures the ratio of translation to rotation in a screw is called the pitch. In the present case the pitch is

\[ (\lambda + \mu + \nu)t/(\xi + \nu + t). \]

Since \(\xi^2 + \eta^2 + \zeta^2\), or \(\varepsilon^2\), is necessarily an absolute invariant for all transformations of the (rectangular) co-ordinate axes, we infer that \(\lambda \xi + \mu \eta + \nu \zeta\) is also an absolute invariant. When the latter invariant, but not the former, vanishes, the displacement is equivalent to a pure rotation.

If the small displacements of a rigid body be subject to one constraint, e.g. if a point of the body be restricted to lie on a given surface, the mathematical expression of this fact leads to a homogeneous linear equation between the infinitesimals \(\xi, \eta, \zeta, \lambda, \mu, \nu\), say

\[ A\xi + B\eta + C\zeta + D\lambda + E\mu + F\nu = 0. \]

The quantities \(\xi, \eta, \zeta, \lambda, \mu, \nu\) are no longer independent, and the body has now only five degrees of freedom. Every additional constraint introduces an additional equation of the type (10) and reduces the number of degrees of freedom by one. In Sir R. S. Ball's "Theory of Screws" an analysis is made of the possible displacements of a body which has respectively two, three, four, five degrees of freedom. We will briefly notice the case of two degrees, which involves an interesting generalization of the method (already explained) of combining rotations about intersecting axes. We assume that the body receives arbitrary twists about two
given screws, and it is required to determine the character of the resultant displacement. We examine first the case where the axes of the two screws are at right angles and intersect. We take these as axes of \(x\) and \(y\); then if \(\xi, \eta\) be the component rotations about them, we have

\[ \lambda = k\xi, \mu = k\eta, \nu = 0, \]

where \(k\) is the pitch of the two given screws. The equations (7) of the axis of the resultant screw then reduce to

\[ x/\xi = y/\eta, z(\xi^2 + \eta^2) = (k - h)\xi. \]

Hence, whatever the ratio \(\xi : \eta\), the axis of the resultant screw lies on the conical surface

\[ z(\xi^2 + \eta^2) = cx^2, \]

where \(c = 1/(k - h)\). The co-ordinates of any point on (15) may be written

\[ x = r \cos \theta, y = r \sin \theta, z = c \sin 2\theta; \]

hence if we imagine a curve of slices to be traced on a circular cylinder so that the circumference just includes two complete revolutions, a straight line cutting the axis of the cylinder at right angles and meeting this curve will generate the surface. This is called a cylindroid. Again, the pitch of the resultant screw is

\[ \rho = (\lambda + \mu + \nu)/(\xi + \eta + \zeta) = k \cos \theta + \nu \sin \theta. \]

The distribution of pitch among the various screws has therefore a simple relation to the pitch-conic

\[ h_x^2 + h_y^2 = \text{const}; \]

viz. the pitch of any screw varies inversely as the square of the diameter of the cone which is parallel to its axis. It is to be noticed that the parameter \(c\) of the cylindroid is unaltered if the two pitches \(h, k\) be increased by equal amounts; the only change is that all the pitches are increased by the same amount. It remains to show that a system of screws of the above type can be constructed so as to contain any two given screws whatever. In the first place, a cylindroid can be constructed so as to have its axis coincident with the common perpendicular to the axes of the two given screws and to satisfy three other conditions, for the position of the centre, the parameter, and the orientation about the axis are still at our disposal. Hence we can adjust these so that the surface shall contain the axes of the two given screws as generators, and that the difference of the corresponding pitches shall have the proper value. It follows that when a body has two degrees of freedom it can twist about any one of a singly infinite system of screws whose axes lie on a certain cylindroid. In particular cases the cylindroid may degenerate into a plane, the pitches being then all equal.

§ 8. Three-dimensional Statics.—A system of parallel forces can be combined two and two until they are replaced by a single resultant equal to their sum, acting in a certain line. As special cases, the system may reduce to a couple, or it may be in equilibrium.

In general, however, a three-dimensional system of forces cannot be replaced by a single resultant force. But it may be reduced to simpler elements in a variety of ways. For example, it may be reduced to two forces in perpendicular skew lines. For consider any plane, and let each force, at its intersection with the plane, be resolved into two components, one (\(P\)) normal to the plane, the other (\(Q\)) in the plane. The assemblage of parallel forces \(P\) can be replaced in general by a single force, and the coplanar system of forces \(Q\) by another single force.
If the plane in question be chosen perpendicular to the direction of the vector-sum of the given forces, the vector-sum of the components Q is zero, and these components are therefore equivalent to a couple (§ 4). Hence any three-dimensional system can be reduced to a single force R acting in a certain line, together with a couple G in a plane perpendicular to the line. This theorem was first given by L. Poinsot, and the line of action of R was called by him the central axis of the system. The combination of a force and a couple in a perpendicular plane is termed by Sir R. S. Ball a wrench. Its type, as distinguished from its absolute magnitude, may be specified by a screw whose axis is the line of action of R, and whose pitch is the ratio G/R.

The case of two forces may be specially noticed. Let AB be the shortest distance between the lines of action, and let AA', BB' (fig. 42) represent the forces. Let \( \alpha \) be the angles which AA', BB' make with the direction of the vector-sum, on opposite sides. Divide AB in O, so that AA' cos \( \alpha \) = + BB' cos \( \alpha \). and draw OC parallel to the vector-sum. Resolving AA', BB' each into two components parallel and perpendicular to OC, we see that the former components have a single resultant in OC, of amount

\[
R = AA' \cos \alpha + BB' \cos \alpha,
\]

whilst the latter components form a couple of moment

\[
G = AA' \sin \alpha = BB' \sin \alpha.
\]

Conversely it is seen that if any wrench can be replaced in an infinite number of ways by two forces, and that the line of action of one of these may be chosen quite arbitrarily. Also, we find from (2) and (3) that

\[
G.R = AA' \cdot BB'. \sin (\alpha - \beta).
\]

The right-hand expression is six times the volume of the tetrahedron of which the lines AA', BB' representing the forces are opposite edges; and we infer that, in whatever way the wrench be resolved into two forces, the volume of the tetrahedron is invariable.

To define the moment of a force about an axis HK, we project the force orthogonally on a plane perpendicular to HK and take the moment of the projection about the intersection of HK with the plane (see § 4). Some convention as to sign is necessary; we shall reckon the moment to be positive when the tendency of the force is right-handed as regards the direction from H to K. Since two concurrent forces and their resultant obviously project into two concurrent forces and their resultant, we see that the sum of the moments of two concurrent forces about any axis HK is equal to the moment of their resultant. Parallel forces may be included in this statement as a limiting case. Hence, in whatever way one system of forces is by successive steps replaced by another, no change is made in the sum of the moments about any assigned axis. By means of this theorem we can show that the previous reduction of any system to a wrench is unique.

From the analogy of couples to translations which was pointed out in § 7, we may infer that a couple is sufficiently represented by a "free" (or non-localized) vector perpendicular to its plane. The length of the vector must be proportional to the moment of the couple, and its sense must be such that the sum of the moments of the two forces of the couple about it is positive. In particular, we infer that couples of the same moment in parallel planes are equivalent; and that couples in any two planes may be compounded by geometrical addition of the corresponding vectors. Independent statical proofs are of course easily given. Thus, let the plane of the paper be perpendicular to the planes of two couples, and therefore perpendicular to the line of intersection of these planes. By § 4, each couple can be replaced by two forces \( \pm P \) (fig. 43) perpendicular to the plane of the paper, and so that one force of each couple is in the line of intersection (B); the arms (AB, BC) will then be proportional to the respective moments. Then the forces at B will cancel, and we are left with a couple of moment P AC in the plane AC. If we draw three vectors to represent these three couples, they will be perpendicular and proportional to the respective sides of the triangle ABC; hence the third vector is the geometric sum of the other two.

Since, in this proof the magnitude of \( P \) is arbitrary, it follows incidentally that couples of the same moment in parallel planes, e.g. planes parallel to AC, are equivalent.

Hence a couple of moment \( G \), whose axis has the direction \((l, m, n)\) relative to a right-handed system of rectangular axes,
MECHANICS

These are the equations of the central axis. Since the moment of the resultant couple is now
\[ G' = \frac{X}{R'} + Y'M' + Z'N' = \frac{LX + MY + NZ}{R}, \] (10)
the pitch of the equivalent wrench is
\[ (LX + MY + NZ)/(X' + Y' + Z'). \]
It appears that \( X^2 + Y^2 + Z^2 \) and \( LX + MY + NZ \) are absolute invariants (cf. § 7). When the latter invariant, but not the former, vanishes, the system reduces to a single force.

The analogy between the mathematical relations of infinitely small displacements on the one hand and those of force-systems on the other enables us immediately to convert any theorem in the one subject into a theorem in the other. For example, we can assert without further proof that any infinitely small displacement may be resolved into two rotations, and that the axis of one of these can be chosen arbitrarily. Again, that wrenches of arbitrary amounts about two given screws compound into a wrench of the locus of whose axes is a cylinder.

The mathematical properties of a twist or of a wrench have been the subject of many remarkable investigations, which are, however, of secondary importance from a physical point of view. In the "Null-System" of A. F. Möbius (1790-1886), a line such that the moment of any given wrench about it is zero is called a null-line. The tripod infinitely short system of null-lines forms what is called in linegeometry a "complex." As regards the configuration of this complex, consider a line whose shortest distance from the central axis is \( k \), and whose inclination to the central axis is \( \theta \). The moment of the resultant force \( R \) of the wrench about this line is \(-kR \sin \theta\), and of the couple \( G \) is \( G \cos \theta \). Hence the line will be a null-line provided
\[ \tan \theta = k/R, \]
where \( \theta \) is the pitch of the wrench. The null-lines which are at a given distance \( r \) from a point \( O \) of the central axis will therefore form one system of generators of a hyperboloid of revolution, and by varying \( r \) we get a series of such hyperboloids with a common centre and axis. By moving \( O \) along the central axis we obtain the whole complex of null-lines. It appears also from (11) that the null-lines whose distance from the central axis is \( k \) are tangent lines of the surfaces of slope \( k/R \), and it is evident that these helices are left-handed if the given wrench is right-handed, and vice versa.

Since the given wrench can be replaced by a force acting through any arbitrary point \( P \), and a couple, the locus of the null-lines through \( P \) is a plane, viz. a plane perpendicular to the vector which represents the couple. The complex is therefore of the type called "linear" (in relation to the degree of this locus). The plane is called the null-plane of \( P \). If the null-plane of \( P \) pass through \( Q \), the null-plane of \( Q \) will pass through \( P \), since \( PQ \) is a null-line. Again, any point \( \omega \) is the locus of a system of null-lines meeting in a point, called the null-point of \( \omega \). If a plane is given a fixed straight line \( \rho \) in it, its null-point describes another straight line \( \rho' \), which is called the conjugate line of \( \rho \). We have seen that the wrench may be replaced by two forces, one of which may act at any arbitrary line \( \rho \). It is now evident that an arbitrary force must act in the conjugate line \( \rho' \), since every line meeting \( \rho \), \( \rho' \) is a null-line. Again, since the shortest distance between any two conjugate lines cuts the central axis at right angles, the orthogonal projections of two conjugate lines on a plane perpendicular to the central axis are equal. If a straight line parallel to a solid, a \"null-line\" is a line such that the lengthwise displacement of any point on it is zero.

Since a wrench is defined by six independent quantities, it can in general be replaced by any system of forces which involves six adjustable elements. For instance, it can in general be replaced by six forces acting in six given lines, e.g. in the six edges of a given tetrahedron. An exception to the general statement occurs when the lines are such that they are possible lines of action of any system of six forces in equilibrium; they are then said to be in involution. The theory of forces in involution has been studied by A. Cayley, J. J. Sylvester, and others. We have seen that a rigid structure may be fixed to the earth by six links, and that now appears that any system of forces acting on the structure can in general be balanced by six determinate forces exerted by the links.

If, however, the links are in involution, these forces become infinite or indeterminate. There is a corresponding kinematic peculiarity, in that the connexion is now not strictly rigid, an infinitely small relative displacement being possible. See § 9.

When parallel forces of given magnitudes act at given points, the resultant acts through a definite point, or centre of parallel forces, which is independent of the special direction of the forces. If \( P \), be the force at \((x, y, z)\), acting in the direction \((l, m, n)\), the formulae (6) and (7) reduce to
\[ X = \Sigma(P)l, \quad Y = \Sigma(P)m, \quad Z = \Sigma(P)n, \]
and
\[ L = \Sigma(P)(n^2 - m^2), \quad M = \Sigma(P)(l^2 - n^2), \quad N = \Sigma(P)(l^2 - m^2). \]
These are the same as if we had a single force \( \Sigma(P) \) acting at the point \((\bar{x}, \bar{y}, \bar{z})\), which is the same for all directions \((l, m, n)\). We can hence derive the theory of the centre of gravity, as in § 4. An exceptional case occurs when \( \Sigma(P) = 0 \).

If we imagine a rigid body to be acted on at given points by forces of given magnitudes in directions (not all parallel) which are fixed in space, then as the body is turned about the resultant wrench will assume different configurations in the body, and will in certain positions reduce to a single force. The investigation of such questions forms the subject of "Statics," which has been cultivated by M. W. H. F. Abert, Minding, G. Darboux and others. As it has no physical bearing it is passed over here.

§ 9. Work. The work done by a force acting on a particle, in any infinitely small displacement, is defined as the product of the force into the orthogonal projection of the displacement on the direction of the force; i.e., it is equal to \( F \cdot \delta \cdot \cos \theta \), where \( F \) is the force, \( \delta \) the displacement, and \( \theta \) is the angle between the directions of \( F \) and \( \delta \). In the language of vector analysis \((a, v)\) it is the "scalar product" of the vector representing the force and the displacement. In the same way, the work done by a force acting on a rigid body in any infinitely small displacement of the body is the scalar product of the force into the displacement of any point on the line of action. This product is the same whatever point on the line of action be taken, since the lengthwise components of the displacements of any two points \( A, B \) on a line \( AB \) are equal, to the first order of small quantities. To see this, let \( A', B' \) be the displaced positions of \( A, B \), and let \( \phi \) be the infinitely small angle between \( AB \) and \( A'B' \). Then if
\[ a, \beta \quad \text{be the orthogonal projections of} \; A', B' \; \text{on} \; AB, \]
we have
\[ A'B' = AB = \beta - \alpha = AB(1 - \cos \phi) = AB \phi'. \]
ultimately. Since this is of the second order, the products \( F.Aa \) and \( F.Bb \) are ultimately equal.

The total work done by two concurrent forces acting on a particle, or on a rigid body, in any infinitely small displacement, is equal to the work of their resultant. Let \( AB, AC \) (fig. 46) represent the forces, \( AD \) their resultant, and let \( AH \) be the direction of the displacement \( \delta \) of the point \( A \). The proposition follows at once from the fact that the sum of orthogonal projections of \( AB, AC \) on \( AH \) is equal to the projection of \( AD \). It is to be noticed that \( AH \) need not be in the same plane with \( AB, AC \).

It follows from the preceding statements that any two systems
of forces which are statically equivalent, according to the principles of §§ 4, 5, (to the first order of small quantities) do the same amount of work in any infinitely small displacement of a rigid body to which they may be applied. It is also evident that the total work done in two or more successive infinitely small displacements is equal to the work done in the resultant displacement.

The work of a couple in any infinitely small rotation of a rigid body about an axis perpendicular to the plane of the couple is equal to the product of the moment of the couple into the angle of rotation, proper conventions as to sign being observed. Let the couple consist of two forces P, P (fig. 47) in the plane of the paper, and let L be the point where this plane is met by the axis of rotation. Draw JBA perpendicular to the lines of action, and let e be the angle of rotation. The work of the couple is

\[ \mathbf{P}. \mathbf{J} = \mathbf{P}. \mathbf{L} \cos \theta - \mathbf{e} \sin \theta \]

where \( \mathbf{J} \) is the moment of the couple, \( \mathbf{P} \) is the force, and \( \theta \) is the angle of rotation.

The analytical calculation of the work done by a force in any infinitesimal displacement is as follows. Let a two-dimensional system we have, in the notation of §§ 3, 4,

\[ \Sigma (X \Delta x + Y \Delta y) = \Sigma (X \lambda - \gamma + Y (\mu + \nu) + 1) \]

\[ = \Sigma \Delta (X, \lambda + \gamma Y, \mu + \nu Y) \Delta x \]

\[ = \mathbf{K} \Delta x \cos \theta - \mathbf{e} \sin \theta \]

Again, for a three-dimensional system, in the notation of §§ 7, 8,

\[ \Sigma (X \Delta x + Y \Delta y + Z \Delta z) = \Sigma \Delta (X \lambda - \gamma Y + Z (\mu + \nu) + 1) \]

\[ = \Sigma \Delta (X, \lambda + \gamma Y + Z (\mu + \nu) + 1) \Delta x \]

\[ = \mathbf{K} \Delta x \cos \theta - \mathbf{e} \sin \theta \]

This expression gives the work done by a given wrench when the body receives a given infinitely small twist; it must of course be an absolute invariant for all transformations of rectangular axes. The first three terms express the work done by the components of a force \( X, Y, Z \) acting at \( O \), and the remaining three terms express the work of a couple (\( L, M, N \)).

The work done by a wrench about a given screw, when the body twists about a second given screw, may be calculated directly as follows. In fig. 48 let \( R, G \) be the force and couple of the wrench, \( \mathbf{R} \) the rotation and translation in the twist. Let the axes of the wrench and the twist be inclined at an angle \( \theta \), and let \( k \) be the shortest distance between them. The displacement of the point \( H \) in the figure, resolved in the direction of \( R \), is \( \tau \), and \( \mathbf{R} \) is given in the direction of \( \sin \theta \).

The work is therefore

\[ \mathbf{R} \cos \theta - \mathbf{e} \sin \theta \]

Let \( G = \mathbf{P}, \tau = \mathbf{p}', \mathbf{P} \) and \( \mathbf{p}' \) are the pitches of the two screws. The factor \( \cos \theta - \mathbf{e} \sin \theta \) is called the \( \mathbf{p} \) of the two screws which define the types of the wrench and twist, respectively. A wrench is determined by its axis and its pitch, and therefore involves five independent elements. These may be, for instance, the five ratios \( \xi : \eta : \zeta : \lambda : \mu \) of the six quantities which specify an infinitesimal twist about the screw. If the twist is a pure rotation, these quantities are subject to the relation

\[ \xi + \mu + \eta + \zeta = 0 \]

In the analytical investigations of line geometry, these six quantities, supposed subject to the relation (4), are used to specify a line, and are called the six “coordinates” of the line; they are of course equivalent to only four independent quantities. If a line is a null-line with respect to the wrench \( X, Y, Z, L, M, N \), the work done in an infinitely small rotation about it is zero, and its coordinates are accordingly subject to the further relation

\[ L \xi + M \mu + N \eta + X \xi + Y \mu + Z \eta = 0 \]

where the coefficients are constant. This is the equation of a “linear complex” (cf. § 8).

Two screws are reciprocal when a wrench about one does no work on a body which twists about the other. The condition for this is

\[ \lambda^2 + \mu^2 + \eta^2 + \zeta^2 + \xi^2 + \mu^2 + \eta^2 = 0 \]

if the screws be defined by the ratios \( \xi : \eta : \zeta : \lambda : \mu : \nu \) respectively. The theory of the screw-systems which are reciprocal to one, two, three, four given screws has been investigated by Sir R. S. Ball.

Considering a rigid body in any given position, we may contemplate the whole group of infinitesimal displacements which might be given to it. If the extraneous forces are in equilibrium the total work which they would perform in any such displacement would be zero, since they reduce to a zero force and a zero couple. This is (in part) the celebrated principle of virtual velocities, now often described as the principle of virtual work, enunciated by John Bernoulli (1667–1748). The word “virtual” is used because the displacements in question are not regarded as actually taking place, the body being in fact at rest. The “velocities” referred to are the velocities of the various points of the body in any imagined motion of the body through the position in question; they obviously bear to one another the same ratios as the corresponding infinitesimal displacements.

Conversely, we can show that if the virtual work of the extraneous forces be zero for every infinitesimal displacement of the body as rigid, these forces must be in equilibrium. For by giving the body (in imagination) a displacement of translation we learn that the sum of the resolved parts of the forces in any assigned direction is zero, and by giving it a displacement of pure rotation we learn that the sum of the moments about any assigned axis is zero. The same thing follows of course from the analytical expression (z) for the virtual work. If this vanishes for all values of \( \lambda, \mu, \nu, \xi, \eta, \zeta \) we must have \( X, Y, Z, L, M, N = 0 \), which are the conditions of equilibrium.

The principle can of course be extended to any system of particles or rigid bodies, connected together in any way, provided we take into account the internal stresses, or reactions, between the various parts. Each such reaction consists of two equal and opposite forces, both of which may contribute to the equation of virtual work.

The proper significance of the principle of virtual work, and of its converse, will appear more clearly when we come to kinetics (§ 16); for the present it may be regarded merely as a compact and (for many purposes) highly convenient summary of the laws of equilibrium. Its special value lies in that, by a suitable adjustment of the hypothetical displacements we are often enabled to eliminate unknown reactions. For example, in the case of a particle lying on a smooth curve, or on a smooth surface, if it be displaced along the curve, or on the surface, the virtual work of the normal component of the pressure may be ignored, since it is of the second order. Again, if two bodies are connected by a string or rod, and if the hypothetical displacements be so chosen that the distance between the points of attachment is unaltered, the corresponding stress may be ignored. This is evident from fig. 45; if \( AB, A'B' \) represent the two positions of a string, and \( T \) the tension, the virtual work of the two forces \( \pm T \) at \( AB, A'B' \), which was shown to be of the second order. Again, the normal pressure between two surfaces disappears from the equation, provided the displacements be such that one of these surfaces merely slides relatively to the other. It is evident, in the first place, that in any displacement common to the two surfaces, the work of the two equal and opposite normal pressures will cancel; moreover if, one of the surfaces being fixed, an infinitely small displacement shifts the point of contact from \( A \) to \( B \), and if \( A' \) be the new position of that point of the sliding body which was at \( A \), the projection of \( AA' \) on the normal at \( A \) is of the second order. It is to be noticed, in this case, that the tangential reaction (if any) between the surfaces is not eliminated. Again, if the displacements be such that one curved surface rolls without sliding on another, the reaction, whether normal or tangential, at the point of contact may be ignored. For the virtual work of two equal and opposite forces will cancel in any displacement which is common to the two surfaces; whilst, if one surface be fixed, the displacement of that point of the rolling surface which was in contact with the other is of the second order. We are thus able to imagine a great variety of mechanical systems to which the principle of virtual work can be applied without any regard to
the internal stresses, provided the hypothetical displacements be such that none of the connexions of the system are violated.

If the system be subject to gravity, the corresponding part of the virtual work can be calculated from the displacement of the centre of gravity. If \( W_1, W_2, \ldots \) be the weights of a system of particles, whose depths below a fixed horizontal plane of reference are \( z_1, z_2, \ldots \), respectively, the virtual work of gravity is

\[
W_1 \delta z_1 + W_2 \delta z_2 + \ldots = \delta (W_1 z_1 + W_2 z_2 + \ldots) = (W_1 + W_2 + \ldots) \delta z,
\]

where \( \delta z \) is the depth of the centre of gravity (see § 8 (14) and § 11 (6)). This expression is the same as if the whole mass were concentrated at the centre of gravity, and displaced with this point. An important conclusion is that in any displacement of a system of bodies in equilibrium, such that the virtual work of all forces except gravity may be ignored, the depth of the centre of gravity is "stationary."

The question as to stability of equilibrium belongs essentially to kinetics; but we may state by anticipation that in cases where gravity is the only force which does work, the equilibrium of a body or system of bodies is stable only if the depth of the centre of gravity is a maximum.

Consider, for instance, the case of a bar resting with its ends on two smooth inclines (fig. 18). If the bar be displaced in a vertical plane so that its ends slide on the two inclines, the instantaneous centre is at the point \( J \). The displacement of \( G \) is at right angles to \( JG \); this shows that for equilibrium \( JG \) must be vertical. Again, the locus of \( G \) is an arc of an ellipse whose centre is in the intersection of the planes; since this is a convex upwards the equilibrium is unstable. A general criterion for the case of a rigid body movable in two dimensions, with one degree of freedom, can be obtained as follows. We have seen (§ 3) that the sequence of possible positions is obtained if we imagine the "body-centre" to roll on the "space-centre." For equilibrium, the altitude of the centre of gravity \( G \) must be stationary; hence \( G \) must lie in the same vertical line with the point of contact of \( J \) of the curves. Further, it is known from the theory of "roulette" that the locus of \( G \) will be concave or convex upwards according as

\[
\cos \phi = \frac{1}{k} + \frac{1}{h},
\]

where \( p, \rho \) are the radii of curvature of the two curves at \( J \), and \( \phi \) is the inclination of the common tangent at \( J \) to the horizontal, and \( h \) is the height of \( G \) above \( J \). The signs of \( p, \rho \) to be taken positive when the curves are as in the standard case, as shown in fig. 49. Hence for stability the upper sign must obtain in (8). The same criterion may be arrived at in a more intuitive manner as follows. If the body be supposed to roll (say to the right) until the curves touch at \( J' \), and if \( J'J = \delta s \), the angle through which the upper figure rotates is \( \delta s + \delta s \). In the horizontal displacement of \( G \) is equal to the product of this expression into \( h \). If this displacement be less than the horizontal projection of \( J'J \) the vertical through the new position of \( G \) will fall to the left of \( J \) and gravity will tend to restore the body to its former position. It is here assumed that the remaining forces acting on the body in its displaced position have zero moment about \( J \); this is evidently the case, for instance, in the problem of "rocking stones."

The principle of virtual work is specially convenient in the theory of frames (§ 6), since the reactions at smooth joints and the stresses in inextensible bars may be left out of account. In particular, in the case of a frame which is just rigid, the principle enables us to find the stress in any one bar independently of the rest. If we imagine the question to be removed, equilibrium will still persist if we introduce two equal and opposite forces \( S \), of suitable magnitude at the joints which it connected. In any infinitely small deformation of the frame as thus modified, the virtual work of the forces \( S \), together with that of the original extraneous forces, must vanish; this determines \( S \).

As a simple example, take the case of a light frame, whose bars form the slides of a rhombus ABCD with the diagonal BD, suspended from \( A \) and carrying a weight \( W \) at \( C \); and let it be required to find

the stress in \( BD \). If we remove the bar \( BD \), and apply two equal and opposite forces \( S \) at \( B \) and \( D \), the equation is

\[
W \delta (2 \cos \theta) + 2S \delta (\sin \theta) = 0,
\]

where \( l \) is the length of a side of the rhombus, and \( \theta \) its inclination to the vertical. Hence

\[
S = W \tan \theta - W. BD/AC.
\]

The method is specially appropriate when the frame, although just rigid, is not "simple" in the sense of § 6, and when accordingly the method of reciprocal figures is not immediately available. To avoid the intricate trigonometrical calculations which would often be necessary, graphical devices have been introduced by R. Müller-Breslau and others. For this purpose the infinitesimal displacements of the various joints are replaced by finite lengths proportional to them, and therefore proportional to the velocities of the points in some imagined motion of the deformable frame through its actual configuration; this is really (it may be remarked) a reduction to the original notion of "virtual velocities." Let \( J \) be the instantaneous centre for any bar \( CD \) (fig. 12), and let \( s_1, s_2 \) represent the virtual velocities of \( C, D \). If these lines be turned through a right angle in the same sense, they take up positions \( CC', DD' \), where \( C', D' \) are on \( JC, JD \), respectively, and \( C'D' \) is parallel to \( CD \). Further, if \( P_1 \) (fig. 51) be any force acting on the joint \( C \), its virtual work will be equal to the product of \( P_1 \) about \( C \); the equation of virtual work is then transformed into an equation of moments.
with corresponding bars parallel, but without complete geometric similarity. In the case of fig. 52 it may be shown that an equivalent condition is that the six points A, B, C, D, E, F should lie on a conic (M. W. Crofton). This is fulfilled when the opposite sides of the hexagon are parallel, and (as a still more special case) when the hexagon is regular.

When a frame has a critical form it may be in a state of stress independently of the action of extraneous forces; moreover, the stresses due to extraneous forces are indeterminate, and may be infinite. For suppose as before that one of the bars is removed. If there are no extraneous forces the equation of virtual work reduces to $S = 0$, where $S$ is the stress in the removed bar, and $S$ is the change in the distance between the joints which it connected. In a critical form we have $S = 0$, and the equation is satisfied by an arbitrary value of $S$; a consistent system of stresses in the remaining bars can then be found by preceding rules. Again, when extraneous forces $P$ act on the joints, the equation is

$$\sum (P \cdot \delta P) - S \cdot \delta s = 0,$$

where $\delta P$ is the displacement of any joint in the direction of the corresponding force $P$. If $\sum (P \cdot \delta P) = 0$, the stresses are merely indeterminate as before; but if $\sum (P \cdot \delta P)$ does not vanish, the equation cannot be satisfied by any finite value of $S$, since $S = 0$. This means that, if the material of the frame were absolutely unyielding, no finite stress in the bars would enable it to withstand the extraneous forces.

With actual materials, the frame would yield elastically, until its configuration is no longer "critical." The stresses in the bars would then be comparatively very great, although finite. The use of frames which approximate to a critical form is of course to be avoided in practice.

A brief reference must suffice to the theory of three dimensional frames. This is important from a technical point of view, since all structures are practically three-dimensional. We may note that a frame of $n$ joints which is joint rigid must have $3n - 6$ bars; and that the stresses produced in such a frame by a given system of extraneous forces in equilibrium are statically determinate, subject to the exception of "critical forms."

§ 10. Statics of Inextensible Chains.—The theory of bodies or structures which are deformable in their smallest parts belongs properly to elasticity (q.v.). The case of inextensible strings or chains is, however, so simple that it is generally included in expositions of pure statics.

It is assumed that the frame can be sufficiently represented by a plane curve, that the stress (tension) at any point $F$ of the curve, between the two portions which meet there, is in the direction of the tangent at $F$, and that the forces on any linear element $\delta s$ must satisfy the conditions of equilibrium laid down in § 1. It follows that the forces on any finite portion will satisfy the conditions of equilibrium which apply to the case of a rigid body (§ 4).

We will suppose in the first instance that the curve is plane. It is often convenient to resolve the forces on an element $PQ (= \delta s)$ in the directions of the tangent and normal respectively. If $T$, $T + \delta T$ be the tensions at $P$, $Q$, and $\delta PQ$ be the angle between the directions of the curve at these points, the components of the tensions along the tangent and normal at $P$ give $(T + \delta T) \cos \psi = T$, or $\delta T$, ultimately; whilst for the component along the normal at $P$ we have $(T + \delta T) \sin \psi = 0$.

$$T = \text{const.}, \ T = \frac{\delta s}{\rho}. \quad (1)$$

The tension is constant, and the pressure per unit length varies as the curvature.

Next suppose that the curve is "rough"; and let $\delta s$ be the tangential force of friction on $\delta s$. We have $\delta T = F \delta s = 0$, $T \delta s = R \delta s$, where the upper or lower sign is to be taken accordingly to the sense in which $F$ acts. We assume that in limiting equilibrium we have $F = \mu R$, everywhere, where $\mu$ is the coefficient of friction. If the string be on the point of slipping in the direction in which $\psi$ increases, the lower sign is to be taken; hence $\delta T = F \delta s = \mu T \delta s$, whence

$$T = T_0 e^{\psi}, \quad (2)$$

if $T_0$ be the tension corresponding to $\psi = 0$. This illustrates the resistance to dragging of a rope collared round a post; e.g. if we put $\psi = \pi$, we find for the change of tension in the line $T = T_0 e^{2\pi}$. In two turns this ratio is squared, and so on.

Again, take the case of a string under gravity, in contact with a smooth curve in a vertical plane. Let $\psi$ denote the inclination to the horizontal, and $w \delta s$ the weight of an element $\delta s$. The tangential and normal components of $w \delta s$ are $-w \delta s \sin \psi$ and $-w \delta s \cos \psi$. Hence

$$\delta T = w \delta s \sin \psi, \ T \delta s = w \delta s \cos \psi + R \delta s \quad (3)$$

If we take rectangular axes $Ox$, $Oy$, of which $Oy$ is drawn vertically upwards, we have $\delta s = \sin \psi \delta s$, whence $\delta T = w \delta s \sin \psi$. If the string be uniform, $w$ is constant, and

$$T = w y + \text{const.} = w(y - y_0), \quad (4)$$

say; hence the tension varies as the height above some fixed level ($y_0$). The pressure is then given by the formula

$$R = T \delta s = w \cos \psi. \quad (5)$$

In the case of a chain hanging freely under gravity it is usually convenient to formulate the conditions of equilibrium of a finite portion $PQ$. The forces on this reduce to three, viz. the weight of $PQ$ and the tensions at $P,Q$. Hence these three forces will be concurrent, and their ratios will be given by a triangle of forces. In particular, if we consider a length $AP$ beginning at the lowest point $A$, then resolving horizontally and vertically we have

$$T \cos \psi = T_0, \ T \sin \psi = W, \quad (6)$$

where $T_0$ is the tension at $A$, and $W$ is the weight of $PA$. The former equation expresses that the horizontal tension is constant.

If the chain be uniform we have $W = ws$, where $s$ is the arc $AP$; hence $\omega = T_0 \tan \psi$. If we write $T_0 = \omega a$, so that $a$ is the length of a portion of the chain whose weight would equal the horizontal tension, this becomes

$$s = a \tan \psi. \quad (7)$$

This is the "intrinsic" equation of the curve. If the axes of $x$ and $y$ be taken horizontal and vertical (upwards), we derive

$$x = a \log (\sec \psi + \tan \psi), \ y = a \sec \psi. \quad (8)$$

Eliminating $\psi$ we obtain the Cartesian equation

$$y = a \cosh \frac{s}{a} \quad (9)$$

of the common catenary, as it is called (fig. 56). The omission of the additive arbitrary constants of integration in (8) is equivalent to a special choice of the origin $O$ of co-ordinates; viz. $O$ is at a distance $a$ vertically below the lowest point ($\psi = 0$) of the curve. The horizontal line through $O$ is called the directrix. The relations

$$s = a \sinh \frac{x}{a}, \ y = a \cosh \frac{s}{a}, \ T = T_0 \sec \psi = w y. \quad (10)$$
which are involved in the preceding formulae are also noteworthy. It is a classical problem in the calculus of variations to deduce the equation (9) from the condition that the depth of the centre of gravity of a chain of given length hanging between fixed points must be stationary (§ 9). The length \( a \) is called the parameter of the catenary; it determines the scale of the curve, all catenaries being geometrically similar. If weights be suspended from various points of a hanging chain, the intervening portions will form arcs of equal catenaries, since the horizontal tension (\( 2w \)) is the same for all. Again, if a chain pass over a perfectly smooth peg, the catenaries in which it hangs on the two sides, though usually of different parameters, will have the same directrix, since by (10) \( y \) is the same for both at the peg.

As an example of the use of the formulae we may determine the maximum span for a wire of given material. The condition is that the tension must not exceed the weight of a certain length \( \lambda \) of the wire. At the ends we shall have \( y = \lambda \), or

\[
\lambda = a \cosh \frac{x}{a}
\]

and the problem is to make \( x \) a maximum for variations of \( a \). Differentiating (11) we find that, if \( ds/da = 0 \),

\[
\frac{2x}{a} \tanh \frac{x}{a} = 1.
\]

It is easily seen graphically, or from a table of hyperbolic tangents, that the equation \( u \tanh u = 1 \) has only one positive root (\( u = 1.200 \)); the span is therefore

\[
x = 2xu = 2\lambda \sinh u = 1.326 \lambda,
\]

and the length of wire

\[
x = 2\lambda/u = 1.667 \lambda.
\]

The tangents at the ends meet on the directrix, and their inclination to the horizontal is \( 55^\circ 30' \).

The relation between the sag, the tension, and the span of a wire (e.g. a telegraph wire) stretched nearly straight between two points \( A, B \) at the same level is determined most simply from first principles. If \( T \) be the tension, \( W \) the total weight, \( k \) the sag in the middle, and \( \rho \) the radius of curvature, we have

\[
\rho = \frac{k}{2} \text{ or } k = \frac{\rho}{2}.
\]

The same formula applies if \( A, B \) be at different levels, provided \( k \) be the sag, measured vertically, half way between \( A \) and \( B \).

In relation to the theory of suspension bridges the case where the weight of any portion of the chain varies as its horizontal projection is of interest. The vertical through the centre of gravity of the arc \( AP \) (see fig. 55) will then bisect its horizontal projection \( AN \); hence if \( PS \) be the tangent at \( P \) we shall have \( AP = SN \). This property is characteristic of a parabola whose axis is vertical. If we take \( A \) as origin and \( AN \) as axis of \( x \), the weight of \( AP \) may be denoted by \( w \), where \( y \) is the weight per unit length at \( A \). Since \( PNS \) is a triangle of forces for the portion \( AP \) of the chain, we have

\[
w = x/2T \text{ or } y = x/2T x.
\]

which is the equation of the parabola in question. The result might of course have been inferred from the theory of the parabolic funicular in § 2.

Finally, we may refer to the catenary of uniform strength, where the cross-section of the wire (or cable) is supposed to vary as the tension. Hence \( w \), the weight per foot, varies as \( T \), and we may write \( T = \omega \), where \( \lambda \) is a constant length. Resolving along the normal the forces on an element \( ds \), we find \( T \psi = \omega x \cos \psi \), whence

\[
\rho = \frac{ds}{d\psi} = \lambda \sec \psi.
\]

From this we derive

\[
x = \lambda \psi, \quad y = \lambda \log \sec \frac{x}{\lambda}
\]

where the directions of \( x \) and \( y \) are horizontal and vertical, and the origin is taken at the lowest point. The curve (fig. 58) has two vertical asymptotes \( x = \lambda \pm \lambda \); this shows that however the thickness of a cable be adjusted there is a limit \( \lambda x \) to the horizontal span, where \( \lambda \) depends on the tensile strength of the material. For a uniform catenary the limit was found above to be \( 1.326 \lambda \).

For investigations relating to the equilibrium of a string in three dimensions we must refer to the textbooks. In the case of a string stretched over a smooth surface, but in other respects free from extraneous force, the tensions at the ends of a small element \( ds \) must be balanced by the normal reaction of the surface. It follows that the osculating plane of the curve formed by the string must contain the normal to the surface, i.e. the curve must be a "geodesic," and that the normal pressure per unit length must vary as the principal curvature of the curve.

§ 11. Theory of Mass-Systems.—This is a purely geometrical subject. We consider a system of points \( P_1, P_2, \ldots, P_n \), with which are associated certain co-efficients \( m_1, m_2, \ldots, m_n \), respectively. In the application to mechanics these coefficients are the masses of particles situate at the respective points, and are therefore all positive. We shall make this supposition in what follows, but it should be remarked that hardly any difference is made in the theory if some of the coefficients have a different sign from the rest, except in the special case where \( \Sigma(m) = 0 \). This has a certain interest in magnetism.

In a given mass-system there exists one and only one point \( G \) such that

\[
\Sigma(m \cdot G - P) = 0,
\]

For, take any point \( O \), and construct the vector

\[
OG = \frac{\Sigma(m \cdot \overrightarrow{OP})}{\Sigma(m)}.
\]

Then

\[
\Sigma(m \cdot G - P) = \Sigma[m(G - G')] = \Sigma(m) \overrightarrow{GO} + \Sigma(m) \overrightarrow{OP} = 0.
\]

Also there cannot be a distinct point \( G' \) such that \( \Sigma(m \cdot G') = 0 \), for we should have, by subtraction,

\[
\Sigma(m \cdot G - P) + \Sigma(m \cdot G') = 0, \quad \Sigma(m) \overrightarrow{G} = 0
\]

i.e. \( G'=0 \); the point \( G \) determined by (1) is called the mass-centre or centre of inertia of the given system. It is easily seen that, in the process of determining the mass-centre, any group of particles may be replaced by a single particle whose mass is equal to that of the group, situate at the mass-centre of the group.

If through \( P_1, P_2, \ldots, P_n \) we draw any system of parallel planes meeting a straight line \( OX \) in the points \( M_1, M_2, \ldots, M_n \), the collinear vectors \( \overrightarrow{OM_1}, \overrightarrow{OM_2}, \ldots, \overrightarrow{OM_n} \) may be called the "projections" of \( \overrightarrow{OP_1}, \overrightarrow{OP_2}, \ldots, \overrightarrow{OP_n} \) on \( OX \). Let these projections be denoted algebraically by \( x_1, x_2, \ldots, x_n \), the sign being positive or negative according as the direction is that of \( OX \) or the reverse. Since the projection of a vector-
by the total mass \(\Sigma(m)\), the result is called the mean square of the distances of the particles from the respective plane, axis or pole. In the case of an axial moment, the square root of the resulting mean square is called the radius of gyration of the system about the axis in question. If we take rectangular axes through any point \(O\), the quadratic moments with respect to the co-ordinate planes are

\[
I_x = \Sigma(mx^2),
I_y = \Sigma(my^2),
I_z = \Sigma(mz^2);
\]

those with respect to the co-ordinate axes are

\[
I_{x'} = \Sigma(m(x'^2 + y'^2)),
I_{y'} = \Sigma(m(y'^2 + z'^2)),
I_{z'} = \Sigma(m(z'^2 + x'^2));
\]

and whilst the polar quadratic moment with respect to \(O\) is

\[
I_o = \Sigma(m(x'^2 + y'^2 + z'^2)).
\]

We note that

\[
I_{x'} = I_{y'},
I_{y'} = I_{z'},
I_o = I_{x'} + I_{y'} + I_{z'} = \frac{1}{2}(2I_{x'} + I_{y'} + I_{z'}),
\]

in the case of continuous distributions of matter the summations in (9), (10) (11) are of course to be replaced by integrations. For a uniform thin circular plate, we find, taking the origin at its centre, and the axis of \(x\) normal to its plane, \(I_x = \frac{1}{2}Ma^2\), where \(M\) is the mass and \(a\) the radius. Since \(I_x = I_y = 0\), we deduce \(I_{x'} = \frac{1}{3}Ma^2\), \(I_{y'} = \frac{1}{3}Ma^2\); hence the value of the squared radius of gyration is for a diameter \(a^2\), and for the axis of symmetry \(\frac{a^2}{4}\). Again, for a uniform solid sphere having its centre at the origin we find \(I_x = I_y = I_z = \frac{1}{5}Ma^2\), \(I_{x'} = I_{y'} = I_{z'} = \frac{1}{5}Ma^2\); i.e., the square of the radius of gyration with respect to any of the three axes \(x, y, z\). The method of homogeneous strain can be applied to deduce the corresponding results for an ellipsoid of semi-axes \(a, b, c\). If the co-ordinate axes coincide with the principal axes, we find \(I_{x'} = \frac{1}{3}Ma^2\), \(I_{y'} = \frac{1}{3}Ma^2\), \(I_{z'} = \frac{1}{3}Ma^2\), whence \(I_{x'} = \frac{1}{3}M(b^2 + c^2)\), etc.

If \(\phi(x, y, z)\) be any homogeneous quadratic function of \(x, y, z\), we have

\[
\Sigma(\phi(x, y, z)) = \Sigma(\phi(x, y, z)) = \Sigma(\phi(x, y, z)),
\]

since the terms which are bilinear in \(x, y, z, \xi, \eta, \zeta\), vanish, in virtue of the relations (7). Thus

\[
I_x = I_y = I_z = \frac{1}{2}I_{x'},
I_{x'} = I_{y'} = I_{z'} = \frac{1}{3}I_o,
\]

with similar relations, and

\[
I_o = 3I_x = 3I_y = 3I_z = 3I_{x'},
\]

The formula (16) expresses that the squared radius of gyration about any axis \((Oz)\) exceeds the squared radius of gyration about a parallel axis through \(G\) by the square of the distance between the two axes. The formula (17) is due to J. L. Lagrange; it may be written

\[
\frac{\Sigma(m, G, P)}{\Sigma(m, G)} = \frac{\Sigma(m, P)}{\Sigma(m)},
\]

and expresses that the mean square of the distances of the particles from \(G\) exceeds the mean square of the distances from \(O\) by \(G^2\). The mass-centre is accordingly that point the mean square of whose distances from the several particles is least. If in (18) we make \(O\) coincide with \(P_1, P_2, \ldots, P_n\) in succession, we obtain

\[
0 + m_1P_2P_3^2 + \ldots + m_nP_{n-1}P_n^2 = \Sigma(m, G, P)^2,
\]

provided the summation \(\Sigma\) on the left hand be understood to include each pair of particles once only. This theorem, also due to Lagrange, enables us to express the mean square of the distances of the particles from the centre of mass in terms of the masses and mutual distances. For instance, considering four equal particles at the vertices of a regular tetrahedron, we can infer that the radius \(R\) of the circumscribing sphere is given by \(R^2 = \frac{3}{4}a\), if \(a\) be the length of an edge.

Another type of quadratic moment is supplied by the deviation-moments, or products of inertia of a distribution of matter. Thus the sum \(\Sigma(m, x)\) is called the "product of inertia" with respect to the planes \(y = \alpha, z = 0\). This may be expressed in terms of the product of inertia with respect to parallel planes through \(G\) by means of the formula (14), viz.:
The quadratic moments with respect to different planes through a fixed point $O$ are related to one another as follows. The moment with respect to the plane

$$\lambda x + \mu y + \nu z = 0,$$

where $\lambda, \mu, \nu$ are direction cosines, is

$$\Sigma m(\lambda x + \mu y + \nu z)^2 = \Sigma m^2 \cdot \lambda^2 + \Sigma m \mu + \Sigma m \nu,$$

and therefore varies as the square of the perpendicular drawn from $O$ to a tangent plane of a curved surface, the tangent plane in question being parallel to (22). If the co-ordinate axes coincide with the principal axes of this quadric, we shall have

$$\Sigma (m y z) = 0, \Sigma (m z x) = 0, \Sigma (m x y) = 0;$$

and if we write

$$\Sigma (m x^2) = M a^2, \Sigma (m y^2) = M b^2, \Sigma (m z^2) = M c^2,$$

where $M = \Sigma (m)$, the quadratic moment becomes $M(a^2 \lambda^2 + b^2 \mu^2 + c^2 \nu^2)$, or $M \rho^2$, where $\rho$ is the distance of the origin from that tangent plane of the ellipsoid

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1,$$

which is parallel to (22). It appears from (24) that through any assigned point $O$ three rectangular axes can be drawn such that the product of inertia with respect to each pair of co-ordinate planes vanishes; these are called the \textit{principal axes of inertia} at $O$. The ellipsoid (26) was first employed by J. Binet (1811), and may be called \"Binet's Ellipsoid\" for the point $O$. Evidently the quadratic moment for a variable plane through $O$ will have a \"stationary\" value when, and only when, the plane coincides with a principal plane of (26). It may further be shown that if Binet's ellipsoid be referred to any system of conjugate diameters as co-ordinate axes, its equation will be

$$x^2/a^2 + y^2/b^2 + z^2/c^2 = 1,$$

provided

$$\Sigma (m x^2) = M a^2, \Sigma (m y^2) = M b^2, \Sigma (m z^2) = M c^2;$$

and also

$$\Sigma (m x y) = 0, \Sigma (m x z) = 0, \Sigma (m y z) = 0.$$  

Let us now take as co-ordinate axes the principal axes of inertia at the mass-centre $G$. If $a, b, c$ be the semi-axes of the Binet's ellipsoid of $G$, the quadratic moment with respect to the plane $\lambda x + \mu y + \nu z = 0$ will be $M(a^2 \lambda^2 + b^2 \mu^2 + c^2 \nu^2)$, and that with respect to a parallel plane $\lambda x' + \mu y' + \nu z' = 0$ will be $M(a^2 \lambda^2 + b^2 \mu^2 + c^2 \nu^2)$, provided

$$\rho^2 = (b^2 - a^2)\lambda^2 + (c^2 - b^2)\mu^2 + (a^2 - c^2)\nu^2,$$

Hence the planes of constant quadratic moment $M \rho^2$ will envelop the quadric

$$\frac{x^2}{\rho^2} = \frac{y^2}{\rho^2} + \frac{z^2}{\rho^2} = 1,$$

and the quadrics corresponding to different values of $\rho^2$ will be confocal. If we write

$$b^2 + c^2 = a^2, \quad c^2 + a^2 = b^2, \quad a^2 + b^2 = c^2,$$

the equation (31) becomes

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1,$$

for different values of $\theta$ this represents a system of quadrics confocal with the ellipsoid

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1,$$

which we shall meet with presently as the \"ellipsoid of gyration\" at $G$. Now consider the tangent plane $\omega$ at any point $P$ of a confocal, the tangent plane $\omega'$ at an adjacent point $N'$, and a plane $\omega''$ through $P$ parallel to $\omega'$. The distance between the planes $\omega'$ and $\omega''$ will be of the second order of small quantities, and the quadratic moments with respect to $\omega'$ and $\omega''$ will therefore be equal, to the first order. Since the quadratic moments with respect to $\omega$ and $\omega'$ are equal, it follows that $\omega$ is a plane of stationary quadratic moment at $P$, and therefore a principal plane of inertia at $P$. In other words, the principal axes of inertia at $P$ are the normals to the three confocal axes of the system (33) which pass through $P$. Moreover if $s, y, z$ be the co-ordinates of $P$, (33) is an equation to find the corresponding values of $\theta$; and if $\theta_1, \theta_2, \theta_3$ be the roots we find

$$\theta_1 + \theta_2 + \theta_3 = \pi = \theta_1 - \theta_2 = \theta_2 - \theta_3 = \theta_3 - \theta_1,$$

where $x^2 + y^2 + z^2 = 0$. The squares of the radii of gyration about the principal axes at $P$ may be denoted by $k_1^2 + k_2^2$, $k_3^2 = k_1^2 + k_2^2$; hence by (32) and (33) they are $\theta_1^2 - \theta_2^2$, $\theta_2^2 - \theta_3^2$, $\theta_3^2 - \theta_1^2$ respectively.

To find the relations between the moments of inertia about different axes through any assigned point $O$, we take $O$ as origin. Since the square of the distance of a point $(x, y, z)$ from the axis

$$\frac{x^2}{\lambda} + \frac{y^2}{\mu} + \frac{z^2}{\nu}$$

is $x^2 + y^2 + z^2 - (\lambda x + \mu y + \nu z)^2$, the moment of inertia about this axis is

$$I = \Sigma [m(\lambda^2 x^2 + \mu^2 y^2 + \nu^2 z^2) - (\lambda x + \mu y + \nu z)^2]]$$

$$= A \Sigma (\lambda^2 x^2 + \mu^2 y^2 + \nu^2 z^2) - 2 F \mu \nu \lambda,$$

provided

$$A = \Sigma m(\lambda^2 + \mu^2 + \nu^2), \quad B = \Sigma m \lambda^2, \quad C = \Sigma m \mu^2;$$

$$F = \Sigma (m y z), \quad G = \Sigma (m x z), \quad H = \Sigma (m x y);$$

i.e. $A, B, C$ are the moments of inertia about the co-ordinate axes, and $F, G, H$ are the products of inertia with respect to the pairs of co-ordinate planes. If we construct the quadric

$$Ax^2 + By^2 + Cz^2 - 2Fyz - 2Gzx - 2Hxy = M \rho^2,$$

where $\rho$ is an arbitrary linear magnitude, the intercept $r$ which makes on a radius drawn in the direction $\lambda, \mu, \nu$ is found by putting $x, y, z = \lambda x, \mu y, \nu z$. Hence, by comparison with (37),

$$I = M \rho^2 r^2.$$  

The moment of inertia about any radius of the quadric (39) therefore varies inversely as the square of the length of this radius. When referred to its principal axes, the equation of the quadric takes the form

$$Ax^2 + By^2 + Cz^2 = M \rho^2.$$

The directions of these axes are determined by the property (24), and therefore coincide with those of the principal axes of inertia at $O$, as already defined in connexion with the theory of plane quadratic moments. The new $A, B, C$ are called the \textit{principal moments of inertia} at $O$. Since they are essentially positive the quadric is an ellipsoid; it is called the \textit{ellipsoid of inertia} at $O$. Since, by (12), $B + C > A$, &c., the sum of the two lesser principal moments must exceed the greatest principal moment. A limitation is thus imposed on the possible forms of the momental ellipsoid; e.g. in the case of symmetry about an axis it appears that the ratio of the polar to the equatorial diameter of the ellipsoid cannot be less than $1/\sqrt{2}$.

If we write $A = M a^2, B = M b^2, C = M c^2$, the formula (37), when referred to the principal axes at $O$, becomes

$$I = M(a^2 x^2 + b^2 y^2 + c^2 z^2) \rho^2,$$

if $\rho$ denotes the perpendicular drawn from $O$ to the direction $(\lambda, \mu, \nu)$ to a tangent plane of the ellipsoid

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1.$$  

This is called the \textit{ellipsoid of gyration} at $O$, it was introduced into the theory by J. MacCullagh. The ellipsoids (41) and (43) are reciprocal polars with respect to a sphere having $O$ as centre.

If $A = B = C$, the momental ellipsoid becomes a sphere; all axes through $O$ are then principal axes, and the moment of inertia is the same for each. The mass-system is then said to possess kinetic symmetry about $O$.

If all the masses lie in a plane $(z = 0)$ we have, in the notation of (25), $\theta = 0$, and therefore $A = M b^2, B = M a^2, C = M \rho^2$. So that the equation of the momental ellipsoid takes the form

$$b^2 x^2 + a^2 y^2 + c^2 z^2 = M \rho^2,$$

The section of this by the plane $z = 0$ is similar to

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1,$$

which may be called the \textit{momental ellipse} at $O$. It possesses the property that the radius of gyration about any diameter is half the distance between the two tangents which are parallel to that diameter. In the case of a uniform triangular plate it may be shown that the momental ellipsoid at $G$ is concentric, similar and similarly situated.
to the ellipse which touches the sides of the triangle at their middle points.

The graphical methods of determining the moment of inertia of a plane system of particles with respect to the line in its plane may be briefly noticed. It appears from § 5, (fig. 31) that the linear moment of each particle about the line may be found by means of a funicular polygon. If we replace the mass of each particle by its moment, as thus found, we can in like manner obtain the quadratic moment of the system with respect to the line. For if the line in question be the axis of y, the first process gives us the values of mx, and the second the value of \(2(mx^2)\) or \(Z(mx^2)\). The construction of a second funicular may be dispensed with by the employment of a planimeter, as follows. In fig. 59 p is the line with respect to which moments are to be taken, and of the system \(\Sigma mx\) is represented for convenient masses, \(O\) is the mass-centre of the system, \(H, K, L, M, \ldots\) are the points of the system, each of which is connected by a line drawn parallel to \(p\) through the positions of the particles and proportional to the respective masses; and its successive sides are produced to meet \(p\) in the points \(H, K, L, M, \ldots\). As explained in § 5, the moment of the first particle is represented on a certain scale by \(OH\), that of the second by \(OK\), and so on. The quadratic moment of the first particle will then be represented by twice the area \(\Delta OHK\), that of the second by twice the area \(\Delta OKL\), and so on. The quadratic moment of the whole system is therefore represented by twice the area \(\Delta OHEDCB\). Since a quadratic moment is essential positive, the various areas are to be taken positive in all cases. If \(a\) be the radius of gyration about \(p\) we find

\[
K^2 = 2 \times \text{area } \Delta OHEDCB \times \frac{a^2}{a},
\]

where \(a\) is the line in the force-diagram which represents the sum of the masses, and \(ON\) is the distance of the pole \(O\) from this line. If some of the particles lie on one side of \(p\) and some on the other, the quadratic moment of each set may be found, and the results added. This is illustrated in fig. 60, where the total quadratic moment is represented by the sum of the shaded areas. It is seen that for a given direction of \(p\), this moment is least when \(p\) passes through the intersection \(X\) of the first and last sides of the funicular, i.e. when \(p\) goes through the mass-centre of the given system; cf. equation (15).

**PART II. -- KINETICS**

§ 12. Rectilinear Motion. — Let \(x\) denote the distance OP of a moving point \(P\) at time \(t\) from a fixed origin \(O\) on the line of motion, this distance being reckoned positive or negative according as it lies to one side or the other of \(O\). At time \(t+\delta t\) let the point be at \(Q\), and let \(OQ = x + \delta x\). The mean velocity of the point in the interval \(\delta t\) is \(dx/dt\). The limiting value of this when \(\delta t\) is infinitely small, viz. \(dx/dt\), is adopted as the definition of the velocity at the instant \(t\). Again, let \(u\) be the velocity at time \(t\), \(u+\delta u\) that at time \(t+\delta t\). The mean of increase of velocity, or the mean acceleration, in the interval \(\delta t\) is then \(\delta u/\delta t\). The limiting value of this when \(\delta t\) is infinitely small, viz., \(du/dt\), is adopted as the definition of the acceleration at the instant \(t\).

Since \(u = dx/dt\), the acceleration is also denoted by \(d^2x/dt^2\). It is often convenient to use the “fluxional” notation for differential coefficients with respect to the time; thus the velocity may be represented by \(\dot{x}\) and the acceleration by \(\ddot{x}\) or \(\ddot{x}\).

If \(u = dx/dt\), the acceleration is also denoted by \(d^2x/dt^2\). It is often convenient to use the “fluxional” notation for differential coefficients with respect to the time; thus the velocity may be represented by \(\dot{x}\) and the acceleration by \(\ddot{x}\) or \(\ddot{x}\).

The relation between \(x\) and \(t\) in any particular case may be illustrated by means of a curve constructed with \(t\) as abscissa and \(x\) as ordinate. This is called the curve of positions or space-time curve; its gradient represents the velocity. Such curves are often traced mechanically in acoustical and other experiments. A curve with \(t\) as abscissa and \(u\) as ordinate is called the curve of velocities or velocity-time curve. Its gradient represents the acceleration, and the area \((\int t\) included between any two ordinates represents the space described in the interval between the corresponding instants (see fig. 62).

So far nothing has been said about the measurement of time. From the purely kinematic point of view, the \(t\) of our formulae may be any continuous independent variable, suggested (it may be) by some physical process. But from the dynamical standpoint it is obvious that equations which represent the facts correctly on one system of time-measurement might become seriously defective on another. It is found that for almost all purposes a system of measurement based ultimately on the earth’s rotation is perfectly adequate. It is only when we come to consider such delicate questions as the influence of tidal friction that other standards become necessary.

The most important conception in kinetics is that of “inertia.” It is a matter of ordinary observation that different bodies act on by the same force, or what is judged to be the same force, undergo different changes of velocity in equal times. In our ideal representation of natural phenomena this is allowed for by endowing each material particle with a suitable mass or inertia-coefficient \(m\). The product \(mu\) of the mass into the velocity is called the momentum or (in Newton’s phrase) the quantity of motion. On the Newtonian system the motion of a particle entirely uninfluenced by other bodies, when referred to a suitable base, would be rectilinear, with constant velocity. If the velocity changes, this is attributed to the action of force; and if we agree to measure the force (X) by the rate of change of momentum which it produces, we have the equation

\[
\frac{du}{dt} = (mu) = X.
\]

From this point of view the equation is a mere truism, its real importance resting on the fact that by attributing suitable values to the masses \(m\), and by making simple assumptions as to the value of \(X\) in each case, we are able to frame adequate representations of whole classes of phenomena as they actually occur. The question remains, of course, as to how far the measurement of force here implied is practically consistent with the gravitational method usually adopted in statics; this will be referred to presently.

The practical unit or standard of mass must, from the nature of the case, be the mass of some particular body, e.g. the imperial pound, or the kilogramme. In the “C.G.S.” system a subdivision of the latter, viz. the gramme, is adopted, and is associated with the centimetre as the unit of length, and the mean solar second as the unit of time. The unit of force implied in (1) is that which produces unit momentum in unit time. On the C.G.S. system it is that force which acting on one gramme for one second produces a velocity of one centimetre per second; this unit is known as the dyne. Units of this kind are called absolute on account of their fundamental and invariable character as contrasted with gravitational units, which (as we shall see presently) vary somewhat with the locality at which the measurements are supposed to be made.

If we integrate the equation (1) with respect to \(t\) between the limits \(t, t'\) we obtain

\[
mu' - mu = \int_{t}^{t'} X dt.
\]

The time-integral on the right hand is called the impulse of the force on the interval \(t' - t\). The statement that the increase of
momentum is equal to the impulse is (it may be remarked) equivalent to Newton's own formulation of his Second Law. The form (1) is deduced from it by putting \( t = \theta t \), and taking \( \theta t \) to be infinitely small. In problems of impact we have to deal with cases of practically instantaneous impulse, where a very great and rapidly varying force produces an appreciable change of momentum in an exceedingly minute interval of time.

In the case of a constant force, the acceleration \( \dot{x} \) or \( \ddot{x} \) is, according to (1), constant, and we have

\[
\frac{d^2x}{dt^2} = a,
\]

say, the general solution of which is

\[
x = \dot{x}t + A + B,
\]

The "arbitrary constants" \( A \), \( B \) enable us to represent the circumstances of any particular case; thus if the velocity \( \dot{x} \) and the position \( x \) be given for any one value of \( t \), we have two conditions to determine \( A \), \( B \). The curve of positions corresponding to (4) is a parabola, and that of velocities is a straight line. We may take it as an experimental result, although the best evidence is indirect, that a particle falling freely under gravity experiences a constant acceleration which at the same place is the same for all bodies. This acceleration is denoted by \( g \); its value at Greenwich is about 98 centimetre-seconds per second. It increases somewhat with the latitude, the extreme variation from the equator to the pole being about \( \frac{1}{2} \% \). We infer that on our reckoning the force of gravity on a mass \( m \) is to be measured by \( mg \), the momentum produced per second when this force acts alone. Since this is proportional to the mass, the relative masses to be attributed to various bodies can be determined practically by means of the balance. We learn also that on account of the variation of \( g \) with the locality a gravitational system of force-measurement is inapplicable when more than a moderate degree of accuracy is desired.

We take next the case of a particle attached towards a fixed point \( O \) in the line of motion with a force varying as the distance from that point. If \( \mu \) be the acceleration at unit distance, the equation of motion becomes

\[
\frac{d^2x}{dt^2} = -\mu x,
\]

the solution of which may be written in either of the forms

\[
x = A \cos \theta t + B \sin \theta t = A \cos (\theta t + \phi),
\]

where \( \sigma = \sqrt{\mu} \), and the constants \( A \), \( B \) or \( \sigma \), \( \epsilon \) are arbitrary. The particle oscillates between the two positions \( x = \pm A \), and the same point is passed through in the same direction with the same velocity at equal intervals of time \( 2\pi/\sigma \). The type of motion represented by (6) is of fundamental importance in the theory of vibrations (§ 25); it is called a simple-harmonic or (shortly) a simple vibration. If we imagine a point \( O \) to describe a circle of radius \( a \) with the angular velocity \( \sigma \), its orthogonal projection \( P \) on a fixed diameter \( OA \) will execute a vibration of this character. The angle \( \sigma t + \phi \) (or \( AOQ \)) is called the phase; the arbitrary elements \( \sigma \), \( \phi \) are called the amplitude and epoch (or initial phase), respectively. In the case of very rapid vibrations it is usual to specify, not the period \( 2\pi/\sigma \), but its reciprocal the frequency, i.e. the number of complete vibrations per unit time. Fig. 62 shows the curves of position and velocity; they both have the form of the "curve of sines." The numbers correspond to an amplitude of 10 centimetres and a period of 2 seconds.

The vertical oscillations of a weight which hangs from a fixed point by a spiral spring come under this case. If \( M \) be the mass, and \( x \) the vertical displacement from the position of equilibrium, the equation of motion of the form

\[
M \frac{d^2x}{dt^2} = -Kx,
\]

provided the inertia of the spring itself be neglected. This becomes identical with (5) if we put \( \mu = K/M \); and the period is therefore \( 2\pi \sqrt{M/K} \), the same for all amplitudes. The period is increased by an increase of the mass \( M \), and diminished by an increase in the stiffness \( K \) of the spring. If \( c \) be the statical increase of length which is produced by the gravity of the mass \( M \), we have \( Kc = Mg \), and the period is \( 2\pi \sqrt{c/g} \).

The small oscillations of a simple pendulum in a vertical plane also come under equation (5). According to the principles of

Fig. 62.
MECHANICS

If we superpose the free vibrations (6) with its arbitrary constants in order to obtain a complete representation of the most general motion consequent on arbitrary initial conditions. A simple mechanical illustration is afforded by the pendulum. If the point of suspension have an imposed simple vibration \( \xi = a \cos \sigma t \) in a horizontal line, the equation of small motion of the bob is

\[
m \ddot{x} = -mg \frac{x - \xi}{l},
\]

or

\[
x + \frac{m \dot{\xi}}{l} \dot{x} = mg.
\]

This is the same as if the point of suspension was fixed, and a horizontal disturbing force \( mg \dot{\xi}/l \) were to act on the bob. The difference of phase of the forced vibration in the two cases is illustrated and explained in the annexed fig. 63, where the pendulum virtually oscillates about \( C \) as a fixed point of suspension. This illustration was given by T. Young in connexion with the kinetic theory of the tides, where the same point arises.

We may notice also the case of an attractive force varying inversely as the square of the distance from the origin. If \( u \) be the acceleration at unit distance, we have

\[
u \frac{du}{dx} = -\frac{u}{x^2},
\]

whence

\[
u^2 = 2u + C,
\]

In the case of a particle falling directly towards the earth from rest at a very great distance we have \( C = 0 \) and, by Newton's Law of Gravitation, \( u = mg \), where \( a \) is the earth's radius. The deviation of the earth's figure from sphericity, and the variation of \( g \) with latitude, are both ignored. We find that the velocity with which the particle would arrive at the earth's surface \( (x = a) \) is \( \sqrt{2g} \). If we take as rough values \( a = 21 \times 10^6 \) feet, \( g = 32 \) foot-second units, we get a velocity of 35,500 feet, or about seven miles, per second. If the particles start from rest at a finite distance \( c \), we have in

\[
x = c \cos \phi, \quad \dot{x} = c \dot{\phi} \sin \phi,
\]

the minus sign indicating motion towards the origin. If we put \( x = c \cos \phi \), we find

\[
\frac{dx}{dt} = c \dot{\phi} \sin \phi,
\]

with the period of revolution in a circular orbit of radius \( c \) about the center of force, viz. \( 2\pi c/\sqrt{2g} \).

This may be compared with the period of revolution in a circular orbit of radius \( c \) about the center of a planet, or a satellite, were arrested, the body would fall into the sun, or into its primary, in the fraction \( 0.01768 \) of its actual period of time. Thus the moon would reach the earth in about five days. It may be noticed that if the scales of \( x \) and \( t \) be properly adjusted, the curve of position in the present problem is the portion of a cycloid extending from a vertex to a cusp.

In any case of rectilinear motion, if we integrate both sides of the equation

\[
\frac{dx}{dt} = X,
\]

which is equivalent to (1), with respect to \( x \) between the limits \( x_0, x_1 \), we obtain

\[
\frac{1}{2} m v^2 - \frac{1}{2} m u^2 = \int_{x_0}^{x_1} X dx.
\]

We recognize the right-hand member as the work done by the force \( X \) on the particle as the latter moves from the position \( x_0 \) to the position \( x_1 \). If we construct a curve with \( x \) as abscissa and \( X \) as ordinate, this work is represented, as in J. Watt's "indicator-diagram," by the area cut off by the ordinates \( x = x_0, x = x_1 \). The product \( svm^2 \) is called the kinetic energy of the particle, and the equation (21) is therefore equivalent to the statement that the increment of the kinetic energy is equal to the work done on the particle. If the force \( X \) be always the same in the same position, the particle may be regarded as moving in a certain invariable "field of force." The work which would have to be supplied by other forces, extraneous to the field, in order to bring the particle from rest in some standard position \( P_0 \) to rest in any assigned position \( P \), will depend only on the position of \( P \); it is called the statical or potential energy of the particle with respect to the field, in the position \( P \). Denoting this by \( V \), we have \( \delta V = -X \delta x \)

\[
X = \frac{dV}{dx}.
\]

The equation (21) may now be written

\[
\frac{1}{2} m u^2 + \frac{1}{2} K v^2 = \frac{1}{2} l^2 + V_0,
\]

which asserts that when no extraneous forces act the sum of the kinetic and potential energies is constant. Thus in the case of a weight hanging by a spiral spring the work required to increase the length by \( x \) is \( V = -KX dx = \frac{1}{2} Kx^2 \), whence \( \frac{1}{2} m u^2 + \frac{1}{2} K v^2 = \) const., as is easily verified from preceding results. It is easily seen that the effect of extraneous forces will be to increase the sum of the kinetic and potential energies by an amount equal to the work done by them. If this amount be negative the sum in question is diminished by a corresponding amount. It appears then that this sum is a measure of the total capacity for doing work against extraneous resistances which the particle possesses in virtue of its motion and its position; this is in fact the origin of the term "energy." The product \( mv^2 \) had been called by G. W. Leibnitz the "vis viv", the name "energy" was substituted by T. Young; finally the name "actual energy" was appropriated to the expression \( \frac{1}{2} m v^2 \) by W. J. M. Rankine.

The laws which regulate the resistance of a medium such as air to the motion of bodies through it are only imperfectly known. We may briefly notice the case of resistance varying as the square of the velocity, which is mathematically simple. If the positive direction of \( x \) be downwards, the equation of motion of a falling particle will be of the form

\[
u \\frac{du}{dx} = -g - ku^2;
\]

this shows that the velocity \( u \) will send asymptotically to a certain limit \( V \) (called the terminal velocity) such that \( ku^2 = g \). The solution is

\[
u = v \tan \frac{g}{V} \cdot x = \frac{V^2}{2g} \log \cos \frac{V}{V},
\]

if the particle start from rest in the position \( x = 0 \) at the instant \( t = 0 \). In the case of a particle projected vertically upwards we have

\[
u \frac{du}{dt} = -g - ku^2,
\]

the positive direction being now upwards. This leads to

\[
u \tan \frac{u}{V} = -\frac{V}{2g} \log \left( 1 + \frac{V}{u} \right),
\]

where \( u_0 \) is the velocity of projection. The particle comes to rest when

\[
u \tan \frac{u}{V} = -\frac{V}{2g} \log \left( 1 + \frac{V}{u} \right).
\]

For small velocities the resistance of the air is more nearly proportional to the first power of the velocity. The effect of forces of this type on small vibratory motions may be investigated as follows. The equation (5) when modified by the introduction of a frictional term becomes

\[
u \frac{du}{dx} = -\mu \nu = -\mu x.
\]

If \( x^2 < \mu x \) the solution is

\[
u = \alpha e^{-\mu t} \cos (\omega t + \phi),
\]

where \( \tau = \sqrt{V/\mu}, \quad \alpha = \sqrt{(\mu - \omega^2)} \), and the constants \( \alpha, \omega, \tau \) are arbitrary. This may be described as a simple harmonic oscillation whose amplitude diminishes asymptotically to zero according to the law \( e^{-\mu t} \). The constant \( \tau \) is called the modulus of decay of the oscillations; if it is large compared with \( 2 \pi \nu \) the effect of friction on the period is of the second order of small quantities and may in general be ignored. We have seen that
a true simple-harmonic vibration may be regarded as the orthogonal projection of uniform circular motion; it was pointed out by P. G. Tait that a similar representation of the type (30) is obtained if we replace the circle by an equiangular spiral described, with a constant angular velocity about the pole, in the direction of diminishing radius vector. When \( R > \mu \), the solution of (29) is, in real form,

\[
x = a e^{\Omega t} \cos \omega t + b e^{\Omega t} \sin \omega t,
\]

where \( \Omega = \sqrt{\omega^2 - \mu^2} \), \( \Omega > 0 \). \( \ast \) \( \ast \)

The body now passes once (at most) through its equilibrium position, and the vibration is therefore styled **aperiodic.**

To find the forced oscillation due to a periodic force we have

\[
x + kx + \mu x = f \cos(\sigma t + \epsilon),
\]

The solution is

\[
x = \int f \cos(\sigma t + \epsilon) dt + \frac{1}{\sigma^2 - \mu^2} \left[ a e^{\Omega t} \cos \omega t + b e^{\Omega t} \sin \omega t \right],
\]

provided

\[
R = \left( \frac{\mu - \sigma^2}{\mu} \right) \left( \frac{\mu + \sigma^2}{\mu} \right), \quad \tan \epsilon = \frac{\mu}{\sigma}.
\]

Hence the phase of the vibration lags behind that of the force by the amount \( \epsilon \), which lies between \( 0 \) and \( \pi \) or between \( \pi \) and \( 2\pi \), according as \( \sigma^2 > \mu \). If the friction be comparatively slight the amplitude is greatly reduced when the time period coincides with the free period, being then equal to \( \sqrt{k/\sigma} \), and therefore very great compared with that due to a slowly varying force of the same average intensity. We have here, in principle, the explanation of the phenomenon of "damped vibrations" in acoustics. The effects of the abnormal amplitude are greater, and is restricted to a narrower range of frequency, the smaller the friction. For a complete solution of (34) we must of course superpose the free vibration (30); but owing to the factor \( e^{\Omega t} \) the influence of the initial conditions gradually disappears.

For purposes of mathematical treatment a force which produces a finite change in velocity in a time too short to be appreciated is regarded as infinitely great, and the time of action as infinitely short. The whole effect is summed up in the value of the instantaneous impulse, which is the time-integral of the force. Thus if an instantaneous impulse \( \xi \) changes the velocity of a mass \( m \) from \( u \) to \( u' \) we have

\[
mu' - mu = \xi.
\]

The effect of ordinary finite forces during the infinitely short duration of this impulse is of course ignored.

We may apply this to the theory of impact. If two masses \( m_1, m_2 \) moving in the same straight line impinge, with the result that the velocities are changed from \( u_1, u_2 \) to \( u_1', u_2' \), then, since the impulses on the two bodies must be equal and opposite, the total momentum is unchanged, i.e.

\[
m_1 u_1 + m_2 u_2 = m_1 u_1' + m_2 u_2'.
\]

The complete determination of the result of a collision under given circumstances is not a matter of abstract dynamics alone, but requires some auxiliary assumption. If we assume that there is no loss of apparent kinetic energy we have also

\[
m_1 u_1^2 + m_2 u_2^2 = m_1 u_1'^2 + m_2 u_2'^2.
\]

Hence, and from (38),

\[
\left( u_1 - u_1' \right) = \left( -u_2 - u_2' \right),
\]

\( \text{i.e.} \) the relative velocity of the two bodies is reversed in direction, but unaltered in magnitude. This appears to be the case very approximately with steel or glass balls; generally, however, there is some appreciable loss of apparent energy; this is accounted for by vibrations produced in the balls and imperfect elasticity of the materials. The usual empirical assumption is that

\[
u_1' - u_1 = \alpha (u_2 - u_1),
\]

where \( \alpha \) is a proper fraction which is constant for the same two bodies. It follows from the formula § 15 (10) for the internal kinetic energy of a system of particles that as a result of the impact this energy is diminished by the amount

\[
\frac{1}{2} (1 - \alpha^2) m_1 m_2 \left( u_1 - u_1' \right)^2.
\]

The further theoretical discussion of the subject belongs to **Elasticity.**

This is perhaps the most suitable place for a few remarks on the theory of "dimensions." (See also **UNITS, DIMENSIONS OF.)** In any absolute system of dynamical measurement the fundamental units are those of mass, length and time; we may denote them by the symbols \( M, L, T \), respectively.

They may be chosen quite arbitrarily, e.g. on the C.G.S. system they are the gramme, centimetre and second. All other units are derived from these. Thus the unit of velocity is that of a point describing the unit of length in the unit of time; it may be denoted by \( \text{LT}^{-1} \), this symbol indicating that the magnitude of the unit in question varies directly as the unit of length and inversely as the unit of time. The unit of acceleration is the acceleration of a point which gains unit velocity in unit time; it is accordingly denoted by \( \text{LT}^{-2} \). The unit of momentum is \( \text{MLT}^{-1} \); the unit force generates unit momentum in unit time and is therefore denoted by \( \text{MLT}^{-2} \). The unit of work on the same principles is \( \text{MLT}^2 \), and it is to be noticed that this is identical with the unit of kinetic energy. Some of these derivative units have special names assigned to them; thus on the C.G.S. system the unit of force is called the **dyne**, and on the C.G.S. system the unit of work or energy the **erg**. The number which expresses a physical quantity of any particular kind will of course vary inversely as the magnitude of the corresponding unit. In any general dynamical equation the dimensions of each term in the fundamental units must be the same, for a change of units would otherwise alter the various terms in different ratios. This principle is often useful as a check on the accuracy of an equation.

The theory of dimensions often enables us to forecast, to some extent, the manner in which the magnitudes involved in any particular problem will enter into the result. Thus, assuming that the period of a small oscillation of a given pendulum at a given place is a definite quantity, we see that it must vary as \( \sqrt{g/l} \). For it can only depend on the mass \( m \) of the bob, the length \( l \) of the string, and the value of \( g \) at the place in question; and the above expression is the only combination of these symbols whose dimensions are those of a time, simply. Again, the time of falling from a distance \( a \) into a given centre of force varying inversely as the square of the distance \( a \) will depend only on \( a \) and on the constant \( g \) of equation (18). The dimensions of \( \sqrt{a/g} \) are those of an acceleration; hence the dimensions of \( a \) are \( \text{LT}^{-2} \). Assuming that the time in question varies as \( a^2 \mu \), whose dimensions are \( \text{L}^{5/2} \text{T}^{-2} \), we must have \( x + 3y = 0 \), \( -2y = 1 \), so that the time of falling will vary as \( a^{5/4} \mu^{1/4} \), in agreement with (19).

The argument appears in a more demonstrative form in the theory of " similar " systems, or (more precisely) of the similar motion of similar systems. Thus, considering the equations

\[
\frac{dx}{dt} = -\frac{\mu}{x^3}, \quad \frac{dx'}{dt'} = -\frac{\mu'}{x^{3/2}},
\]

which refer to two particles falling independently into two distinct centres of force, it is obvious that it is possible to have \( x \) in a constant ratio to \( x' \), and \( t \) in a constant ratio to \( t' \); provided that

\[
\frac{x}{x'} = \frac{\mu^{3/4}}{\mu'^{1/4}}, \quad \frac{t}{t'} = \frac{\mu'^{1/2}}{\mu^{3/4}},
\]

and that there is a suitable correspondence between the initial conditions. The relation (44) is equivalent to

\[
l + l' = \frac{x'}{x} = \frac{\mu^{3/4}}{\mu'^{1/4}}, \quad \frac{t'}{t} = \frac{\mu'^{1/2}}{\mu^{3/4}},
\]

where \( x', x \) are any two corresponding distances; e.g. they may be the initial distances, both particles being supposed to start from rest. The consideration of dimensions was introduced by J. B. Fourier (1822) in connexion with the conduction of heat.

§ 13. **General Motion of a Particle.**—Let \( O \), \( P \) be the positions of a moving point at times \( t \), \( t + \delta t \) respectively. A vector \( \overrightarrow{OU} \) drawn parallel to \( \overrightarrow{PO} \), of length proportional to \( PQ/\delta t \) on any convenient scale, will represent the **mean velocity** in the interval \( \delta t \), i.e. a point moving with a constant velocity having the magnitude and direction indicated by this vector would experience the same resultant displacement \( \overrightarrow{PO} \) in the same time. As \( \delta t \) is indefinitely diminished, the vector \( \overrightarrow{OU} \) will tend to a definite limit \( \overrightarrow{OV} \); this is adopted as the definition
of the velocity of the moving point at the instant $t$. Obviously $\mathbf{O}$V is parallel to the tangent to the path at $\mathbf{P}$, and its magnitude is $ds/dt$, where $s$ is the arc. If we project $OV$ on the co-ordinate axes (rectangular or oblique) in the usual manner, the projections $u, v, w$ are called the component velocities parallel to the axes. If $x, y, z$ be the co-ordinates of $P$ it is easily proved that

$$u = \frac{dx}{dt}, \quad v = \frac{dy}{dt}, \quad w = \frac{dz}{dt}$$

(1)

The momentum of a particle is the vector obtained by multiplying the velocity by the mass $m$. The impulse of a force in any infinitely small interval of time $dt$ is the product of the force into $dt$; it is to be regarded as a vector. The total impulse in any finite interval of time is the integral of the impulses corresponding to the infinitesimal elements $dt$ into which the interval may be subdivided; the summation of which the integral is the limit of is course to be understood in the vectorial sense.

Newton's Second Law asserts that change of momentum is equal to the impulse; this is a statement as to equality of vectors and so implies identity of direction as well as of magnitude. If $X, Y, Z$ be the components of force, then considering the changes in an infinitely short time $dt$ we have, by projection on the co-ordinate axes, $m\frac{dx}{dt} = Xdt$, and so on, or

$$m\frac{dx}{dt} = X, \quad m\frac{dy}{dt} = Y, \quad m\frac{dz}{dt} = Z.$$  

(2)

For example, the path of a particle projected anywhere under gravity will obviously be confined to the vertical plane through the initial direction of motion. Taking this as the plane $xy$, with the axis of $x$ drawn horizontally, and that of $y$ vertically upwards, we have $X = 0, Y = -mg$; so that

$$\frac{d^2x}{dt^2} = 0, \quad \frac{d^2y}{dt^2} = -g.$$  

(3)

The solution is

$$x = At + B, \quad y = -gt^2/2 + Ct + D.$$  

(4)

If the initial values of $x, y, v, t$ are given, we have four conditions to determine the four arbitrary constants $A, B, C, D$. Thus if the particle start at time $t = 0$ from the origin, with the component velocities $u_0, v_0$, we have

$$x = u_0t, \quad y = v_0t - \frac{1}{2}gt^2.$$  

(5)

Eliminating $t$ we have the equation of the path, viz.

$$y = \frac{v_0}{u_0}x - \frac{1}{2}gt^2 - \frac{v_0^2}{2u_0^2}.$$  

(6)

This is a parabola with vertical axis, of latus-rectum $2u_0^2/g$. The range on a horizontal plane through $O$ is got by putting $y = 0$, viz. it is $2u_0^2/g$. If we denote the resultant velocity at any instant by $\delta$ we have

$$\delta = \sqrt{x^2 + y^2} = \sqrt{x^2 - 2gy}.$$  

(7)

Another important example is that of a particle in motion towards an acceleration which is directed always towards a fixed point $O$ and is proportional to the distance from $O$. The motion will evidently be in one plane, which we take as the plane $x = 0$. If $\mu$ be the acceleration at unit distance, the component accelerations parallel to axes of $x$ and $y$ through $O$ as origin will be $-\mu x, -\mu y$, whence

$$\frac{d^2x}{dt^2} = -\mu x, \quad \frac{d^2y}{dt^2} = -\mu y.$$  

(8)

The solution is

$$x = A \cos nt + B \sin nt, \quad y = C \cos nt + D \sin nt,$$  

(9)

where $n = \sqrt{\mu}$. If $P$ be the initial position of the particle, we can take OP as axis of $x$, and draw Oy parallel to the direction of motion at $P$. If $OP = a, \beta$ be the velocity at $P$, we have, initially, $x = a, y = 0, \dot{x} = x = 0, \dot{y} = \dot{y}$; whence

$$x = A \cos nt, \quad y = B \sin nt,$$  

(10)

if $b = \dot{y}/\dot{y}$. The path is therefore an ellipse of which $a, \beta$ are conjugate semi-diameters, and is described in the period $2\pi/\sqrt{\mu}$; moreover, the velocity at any point $P$ is equal to $A \mu O, OD$ where $OD$ is the semi-diameter conjugate to OP. This type of motion is called elliptic harmonic. If the co-ordinate axes are the principal axes of the ellipse, the angle $nt$ in (10) is identical with the “excentric angle.” The motion of the bob of a “spherical pendulum,” i.e., a simple pendulum whose oscillations are not confined to one vertical plane, is of this character, provided the extreme inclination of the string to the vertical be small. The acceleration is towards the vertical through the point of suspension, and is equal to $g/\ell$, approximately, if $\ell$ denote distance from this vertical. Hence the path is approximately an ellipse, and the period is $2\pi \sqrt{\ell/g}$.

The above problem is identical with that of the oscillation of a particle in a smooth spherical bowl, in the neighbourhood of the lowest point. If the bowl has any other shape, the axes Ox, Oy may be taken tangent to the lines of curvature at the lowest point $O$; the equations of small motion then are

$$\frac{d^2x}{dt^2} = -\frac{x}{\rho_1^2}, \quad \frac{d^2y}{dt^2} = -\frac{y}{\rho_2^2}.$$  

(11)

where $\rho_1, \rho_2$ are the principal radii of curvature at $O$. The motion is therefore the resultant of two simple vibrations in perpendicular directions, of periods $2\pi \sqrt{\ell/\rho_1}, 2\pi \sqrt{\ell/\rho_2}$. The circumstances are realized in "Blackburn’s pendulum," which consists of a weight $P$ hanging from a point $C$ of a string ACB whose ends A, B are fixed. If E be the point in the line of the string meets AB, we have $\rho_1 = CP, \rho_2 = EP$. Many contrivances for actually drawing the resulting curves have been devised. It is sometimes convenient to resolve the accelerations in directions having a more intrinsic relation to the path. Thus, in a plane path, let $PQ$ be two consecutive positions, corresponding to the times $t, t + \delta t$; and let the normals at $P, Q$ meet in $C$, making an angle $\delta \phi$. Let $v = \delta t$; the velocity parallel to the tangent at $P$ changes from $v$ to $v + \delta v$, ultimately, and the tangential acceleration at $P$ is therefore $dv/dt$. Again, the velocity parallel to the normal at $P$ changes from $v$ to $v + \delta v$, ultimately, so that the normal acceleration is $d^2v/dt^2$. Since

$$\frac{d^2x}{dt^2} = \frac{dx}{dt} \frac{dv}{dt} = v \frac{dv}{dt}, \quad \frac{d^2y}{dt^2} = \frac{dy}{dt} \frac{dv}{dt} = \frac{dv}{dt}$$

(12)

where $\rho$ is the radius of curvature of the path at $P$, the tangential and normal accelerations are also expressed by $v dv/ds$ and $v^2/\rho$, respectively. Take, for example, the case of a particle moving on a smooth curve in a vertical plane, under the action of gravity and the pressure $R$ of the curve. If the axes of $x$ and $y$ be drawn horizontal and vertical (upwards), and if $\psi$ be the inclination of the tangent to the horizontal, we have

$$\frac{dv}{ds} = -mg \sin \psi = -mg \frac{dy}{dx} \cos \psi = -mg \frac{mv^2}{\rho} = -mg \cos \psi + R.$$  

(13)

The former equation gives

$$v^2 = C - 2gy,$$  

and the latter then determines $R$.

In the case of the pendulum the tension of the string takes the place of the pressure of the curve. If $l$ be the length of the string, $\psi$ its inclination to the downward vertical, we have $\delta s = l \psi$, so that $v = l \psi \psi$. The tangential resolution then gives

$$\frac{d^2\psi}{dx^2} = -g \sin \psi.$$  

(15)

If we multiply by $2d\psi/dt$ and integrate, we obtain

$$\left(\frac{d^2\psi}{dx^2}\right)^2 = \frac{C}{l} \cos \psi + \text{const.},$$  

(16)

which is seen to be equivalent to (14). If the pendulum oscillate between the limits $\psi = a$, we have

$$\left(\frac{d^2\psi}{dx^2}\right)^2 = \frac{2g}{l} \cos \psi \cos \phi = \frac{1}{\sin^2 \alpha - \sin^2 \beta};$$  

(17)

and, putting $\sin \frac{1}{2}\phi = \sin \frac{1}{2}a, \sin \phi, \sin \phi$, we find for the period ($r$) of a complete oscillation

$$r = 4 \int_0^{\pi/2} \frac{dx}{d\beta} = 4 \sqrt{\frac{\ell}{g}} \int_0^{\pi/2} \frac{1}{\sqrt{1 - \sin^2 \frac{1}{2}a \sin^2 \phi}}$$

$$= 4 \sqrt{\frac{\ell}{g}} \cdot F(\sin \frac{1}{2}a),$$  

(18)
in the notation of elliptic integrals. The function $F_t, \sin(\beta)$ was tabulated by A. M. Legendre for values of $\beta$ ranging from $0^\circ$ to $90^\circ$. The following table gives the period, for various amplitudes $a$, in terms of that of oscillation in an infinitely small arc [viz. $2\pi\sqrt{g/l}$] as unit.

<table>

</table>

The value of $r$ can also be obtained as an infinite series, by expanding the integrand in (18) by the binomial theorem, and integrating term by term. Thus

$$r = 2\sqrt{\frac{g}{l}} \left( 1 - \frac{1}{2} \sin^2 \frac{a}{r} - \frac{1}{2} \frac{3}{4} \sin^4 \frac{a}{r} + \ldots \right).$$

(19)

If $a$ be small, an approximation (usually sufficient) is

$$r = 2\sqrt{\frac{g}{l}} \left( 1 + \frac{1}{2} \sin^2 a \right).$$

In the extreme case of $a = \pi$, the equation (17) is immediately integrable; thus the time from the lowest position is $t = \sqrt{\frac{l}{g}} \log \tan \left( \frac{\pi}{2} + \frac{a}{r} \right).$

(20)

This becomes infinite for $\psi = \pi$, showing that the pendulum only tends asymptotically to the highest position.

The period of vibration with amplitude was at one time a hindrance to the accurate performance of pendulum clocks, since the errors produced are cumulative. It was therefore sought to replace the circular pendulum by some other contrivance free from this defect. The equation of motion of a particle in any smooth path is

$$\frac{d^2 \psi}{dt^2} = -\frac{g}{l} \sin \psi,$$

(21)

where $\psi$ is the inclination of the tangent to the horizontal. If $\sin \psi$ were accurately and not merely approximately proportional to the arc, say

$$s = \delta \sin \psi,$$

(22)

the equation (21) would assume the same form as § 12 (5). The motion along the arc would then be accurately simple-harmonic, and the period $2\sqrt{g/l}$ would be the same for all amplitudes. Now equation (22) is the intrinsic equation of a cycloid; viz: the curve is that traced by a point on the circumference of a circle of radius $\frac{1}{2}a$ which rolls on the under side of a horizontal straight line. Since the evolution of a cycloid is that of an equal cycloid the object is attained by means of two metal shanks, having the form of the evolve near the cusp, on which the string wraps itself alternately as the pendulum swings. The device has long been abandoned, the difficulty being met in other ways, but the problem, originally investigated by C. Huygens, is important in the history of mathematics.

The component accelerations of a point describing a tortuous curve, in the directions of the tangent, the principal normal, and the binormal, respectively, are found as follows. If $OV$, $OV'$ be vectors representing the velocities at two consecutive points $P, P'$ of the path, the plane $VOV'$ is ultimately parallel to the osculating plane of the path at $P$; the resultant acceleration is therefore in the osculating plane. Also, the projections of $V'V$ on $OV$ and on a perpendicular to $OV$ in the plane $V'V$ are $dv$ and $\omega d\theta$, where $dv$ is the angle between the directions of the tangents at $P, P'$. Since $\delta s = \delta s/\rho$, where $\delta s = PP' = n^2 s$, and $\rho$ is the radius of principal curvature at $P$, the component accelerations along the tangent and principal normal are $dv/\alpha t$ and $\omega d\theta/\omega$, respectively, or $dv/\omega$ and $\omega/\omega$. For example, if a particle moves on a smooth surface, under no forces except the reaction of the surface, $\omega$ is constant, and the principal normal to the path will coincide with the normal to the surface. Hence the path is a "geodesic" on the surface.

If we resolve along the tangent to the path (whether plane or tortuous), the equation of motion of a particle may be written

$$\frac{d^2 \psi}{dt^2} = \frac{g}{l} \sin \psi,$$

(23)

where $\mathbf{T}$ is the tangential component of the force. Integrating with respect to $s$ we find

$$\int m_b = -\frac{1}{2} m \omega^2 + \frac{1}{2} \omega^2 \omega.$$

(24)

### MECHANICS

i.e. the increase of kinetic energy between any two positions is equal to the work done by the forces. The result follows also from the Cartesian equations (2); viz. we have

$$m(\dot{x}^2 + \dot{y}^2 + \dot{z}^2) = x\ddot{y} + y\ddot{x} + z\ddot{z},$$

whence, on integration with respect to $t$,

$$\int m(\dot{x}^2 + \dot{y}^2 + \dot{z}^2) = \int (x\ddot{y} + y\ddot{x} + z\ddot{z}) + \text{const.}$$

(25)

$$= \int (x\ddot{y} + y\ddot{x} + z\ddot{z}) + \text{const.}$$

(26)

If the axes be rectangular, this has the same interpretation as (24).

Suppose now that we have a constant field of force; i.e. the force acting on the particle is always the same at the same place. The work which must be done by forces extraneous to the field in order to bring the particle from rest in some standard position $A$ to rest in any other position $P$ will not necessarily be the same for all paths between $A$ and $P$. If it is different for different paths, then by bringing the particle from $A$ to $P$ by one path, and back again from $P$ to $A$ by another, we might secure a gain of work, and the process could be repeated indefinitely. If the work required is the same for all paths between $A$ and $P$, and therefore zero for a closed circuit, the field is said to be conservative. In this case the work required to bring the particle from rest at $A$ to rest at $P$ is called the potential energy of the particle in the position $P$; we denote it by $V$. If $PP'$ be a linear element $d\ell$ drawn in any direction from $P$, and $S$ be the force due to the field, resolved in the direction $PP'$, we have $d\ell = -dS$ or

$$S = -\frac{d\ell}{dS}.$$  

(27)

In particular, by taking $PP'$ parallel to each of the (rectangular) co-ordinate axes in succession, we find

$$X = -\frac{\partial V}{\partial x}, \quad Y = -\frac{\partial V}{\partial y}, \quad Z = -\frac{\partial V}{\partial z}.$$  

(28)

The equation (24) or (26) now gives

$$\int m_b^2 + V_1 = \int m_a^2 + V_1;$$

(29)

i.e. the sum of the kinetic and potential energies is constant when no work is done by extraneous forces. For example, if the field be that due to gravity we have $V = mgx^2$, the axis by being vertically upwards; hence

$$\frac{d^2 \psi}{dt^2} + mg = \text{const.}$$

(30)

This applies to motion on a smooth curve, as well as to the free motion of a projectile; cf. (7), (14). Again, in the case of a force $k$ towards $O$, where $r$ denotes distance from $O$ we have $V = kr^2$, $\frac{d^2 \psi}{dt^2} + kr^2 = \text{const.}$

(31)

It has been seen that the orbit is in this case an ellipse; also that if we put $\mu = K/m$ the velocity at any point $P$ is $\mu \psi$, OD, where OD is the semi-diameter conjugate to OP. Hence (31) is consistent with the known property of the ellipse that $OP^2 + OD^2$ is constant.

The forms assumed by the dynamical equations when the axes of reference are themselves in motion will be considered in § 21. At present we take only the case in which the rectangular axes Ox, Oy rotate in their own plane, with angular velocity $\omega$ about Oz which is fixed. In the interval $dt$ the projections of the line joining the origin to any point $(x, y)$ on the directions of the co-ordinate axes at time $t$ are changed from $x, y, t$ to $(x + \omega t \sin a, y + \omega t \sin b, t + \omega t \sin a + \omega t \sin b)$, respectively. Hence the component velocities parallel to the instantaneous positions of the co-ordinate axes at time $t$ are

$$\frac{d\psi}{dt} = k - \omega \psi.$$  

(32)

In the same way we find that the component accelerations are

$$\frac{d\psi}{dt} + \omega \psi - \omega \psi.$$

(33)

Hence if $\psi$ be constant the equations of motion take the form

$$m(\dot{x}^2 + 2\omega \dot{x} - \omega^2 x) = 0, \quad m(\dot{y}^2 + 2\omega \dot{y} - \omega^2 y) = 0, \quad m(\dot{z}^2 + 2\omega \dot{z} - \omega^2 z) = 0.$$  

(34)

These become identical with the equations of motion relative to fixed axes provided we introduce a fictitious force $m_0\psi$ acting outwards from the axis of $z$, where $r = \sqrt{(x^2 + y^2)}$, and a second fictitious force $2m_0\omega$ at right angles to the path, where $\psi$ is the component of the relative velocity parallel to the plane $xy$. The former force is called by French writers the force centrifugé ordinaire, and the latter the force centrifugé composée, or force de Coriolis. As an application of (34) we may take the case of a symmetrical Blackburn's pendulum hanging from a horizontal bar which is made to rotate
about a vertical axis half-way between the points of attachment of the upper string. The equations of small motion are then of the type
\[ \ddot{x} - 2 \omega \dot{x} \omega x = - \dddot{p} x, \dot{y} + 2 \omega \dot{y} \omega y = - \dddot{p} y. \] (35)
This is satisfied by
\[ \ddot{x} = A \cos \theta + \epsilon, \quad \dot{y} = B \sin \theta + \epsilon, \] (36)
provided
\[ (\dot{\alpha}^2 + \dot{\alpha}^2 - \ddot{\alpha}^2) + 2 \alpha \ddot{\alpha} = 0. \] (37)
Eliminating the ratio $\alpha: B$ we have
\[ (\dot{\alpha}^2 + \dot{\alpha}^2 - \ddot{\alpha}^2) - 4 \alpha \ddot{\alpha} = 0. \] (38)
It is easily proved that the roots of this quadratic in $\alpha$ are always real, and that they are moreover both positive unless $\dot{\alpha}$ lies between $\dot{p}$ and $\ddot{p}$. The ratio $\alpha: B$ is determined in each case either by the equations (37); hence each root of the quadratic gives a solution of the type (36), with two arbitrary constants $A, \epsilon$. Since the equations (35) are linear, these two solutions are to be superposed. If the quadratic (36) has a negative root, the trigonometrical functions in (36) are to be replaced by real exponentials, and the position $x = 0, y = 0$ is unstable. This occurs only when the period $(2\pi/\omega)$ of oscillation of the arm lies between the two periods $(2\pi/\alpha, 2\pi/\beta)$ of oscillation when the arm is fixed.

§ 14. Central Forces. Hodograph.—The motion of a particle subject to a force which passes always through a fixed point $O$ is necessarily in a plane orbit. For its investigation we require two equations; these may be obtained in a variety of forms.

Since the impulse of the force in any element of time $\delta t$ has zero moment about $O$, the same will be true of the additional momentum generated. Hence the moment of the momentum (considered as a localized vector) about $O$ will be constant. In symbols, if $v$ is the velocity and $p$ the perpendicular from $O$ to the tangent of the path, $p = h$, (1)

where $h$ is a constant. If $\delta s$ be an element of the path, $p\delta s$ is twice the area enclosed by $\delta s$ and the radius drawn to its extremities from $O$. Hence if $\delta A$ be this area, we have $A = \frac{1}{2} \ p\delta s = \frac{1}{2} \ h\delta t$, or

\[ \frac{\delta A}{\delta t} = \frac{1}{2} h. \] (2)

Hence equal areas are swept over by the radius vector in equal times.

If $P$ be the acceleration towards $O$, we have
\[ \frac{dp}{ds} = - P \frac{dr}{ds}, \] (3)

since $dr/ds$ is the cosine of the angle between the directions of $r$ and $\delta s$. We will suppose that $P$ is a function of $r$ only; then integrating (3) we find

\[ \frac{p^2}{r} = C - \frac{1}{2} |P| dr + \text{const}, \] (4)

which is recognized as the equation of energy. Combining this with (1) we have
\[ \frac{p^2}{r} = C - 2 |P| dr, \] (5)

which completely determines the path except as to its orientation with respect to $O$.

If the law of attraction be that of the inverse square of the distance, we have $P = \mu/r^2$, and
\[ \frac{p^2}{r} = C + 2\mu/r. \] (6)

Now in a conic whose focus is at $O$ we have
\[ \frac{1}{p^2} = \frac{2}{r} \frac{1}{a}, \] (7)

where $l$ is the latus-rectum, $a$ is half the major axis, and the upper or lower sign is to be taken according as the conic is an ellipse or hyperbola. In the intermediate case of the parabola we have $a = \infty$ and the last term disappears. The equations (6) and (7) are identified by putting
\[ l = 2h^2 a, \quad a = \mu/C. \] (8)

Since
\[ \frac{p^2}{r} = \mu \left( \frac{1}{r} - \frac{1}{a} \right), \] (9)

it appears that the orbit is an ellipse, parabola or hyperbola, according as $\mu$ is less than, equal to, or greater than $2\mu/r$. Now it appears from (6) that $2\mu/r$ is the square of the velocity which would be acquired by a particle falling from rest at infinity to the distance $r$. Hence the character of the orbit depends on whether the velocity at any point is less than, equal to, or greater than the velocity from infinity, as it is called. In an elliptic orbit the area $\alpha \beta b$ is swept over in the time
\[ t = \frac{\alpha \beta b}{\mu}, \] (10)

since $h = \mu |b| = \mu b a^{-1}$ by (8).

The converse problem, to determine the law of force under which a given orbit can be described about a given pole, is solved by differentiating (5) with respect to $r$; thus
\[ P = \frac{h^2 r}{p^2}. \] (11)

In the case of an ellipse described about the centre as pole we have
\[ \frac{p^2}{r} = a^2 + b^2 - r^2; \] (12)

hence $P = \mu$, if $\mu = h^2 a^2 b^2$. This merely shows that a particular ellipse may be described under the law of the direct distance provided the circumstances of projection be suitably adjusted. But since an ellipse can always be constructed with a given centre so as to touch a given line at a given point, and to have a given value of $a h (= h \sqrt{n}/\mu)$ we infer that the orbit will be elliptic whatever the initial circumstances. Also the period is $2\pi a b / 2\epsilon 2\sqrt{n}/\mu$, as previously found.

Again, in the equianuarg spiral we have $p = \mu r$, and therefore $P = \mu r^2$, if $\mu = h^2 a^2 b^2$. But since an equianuarg spiral having a given pole is completely determined by a given point and a given tangent, this type of orbit is not one general for the law of the inverse cube. In order that the spiral may be described it is necessary that the velocity of projection should be adjusted to make $h = \sqrt{n}/\mu$, $a$. Similarly, in the case of a circle with the pole on the circumference we have $p = \sqrt{n} a^2$, $P = \mu / a^2$, if $\mu = b^2 a^2$; but this orbit is not a general one for the law of the inverse fifth power.

In astronomical and other investigations relating to central forces it is often convenient to use polar co-ordinates with the centre of force as pole. Let $P$, $Q$ be the positions of a moving point at times $t$, $t + \delta t$, and write $OP = r, OQ = r + \delta r$, $\dot{OP}Q = \delta t, O$ being any fixed origin. If $u, v$ be the component velocities at $P$ along and perpendicular to $OP$ (in the direction of $\theta$ increasing), we have

\[ u = \lim_{\delta t \to 0} \frac{\delta r}{\delta t}, \quad v = \lim_{\delta t \to 0} \frac{\delta \theta}{\delta t}. \] (13)

Again, the velocities parallel and perpendicular to $OP$ change in the time $\delta t$ from $u, v$ to $u - \omega \delta v, v + \omega \delta u$, ultimately. The component accelerations at $P$ in these directions are therefore

\begin{align*}
\frac{du}{dt} & = \frac{1}{2} \frac{p^2}{r^2} \frac{dr}{dt}, \\
\frac{dv}{dt} & = \frac{1}{2} \frac{p^2}{r^2} \frac{d\theta}{dt},
\end{align*}

respectively.

In the case of a central force, with $O$ as pole, the transverse acceleration vanishes, so that
\[ \frac{d\rho d\rho}{dt} = 0, \] (15)

where $h$ is constant; this shows (again) that the radius vector sweeps over equal areas in equal times. The radial resolution gives
\[ \frac{d\rho}{dt} = \frac{1}{2} \frac{p^2}{r^2} - r \frac{d\rho}{dt} = - P, \] (16)

where $P$, as before, denotes the acceleration towards $O$. In this we put $r = 1/\mu$, and eliminate $t$ by means of (15), we obtain the general differential equation of central orbits, viz.

\[ \frac{d\mu}{dt} + u = \frac{P}{\mu^2}. \] (17)

If, for example, the law be that of the inverse square, we have $P = \mu / r^3$, and the solution is of the form

\[ u = \frac{\mu}{4 \rho^2 (1 + \cos \theta - a)}, \] (18)

where $e, a$ are arbitrary constants. This is recognized as the polar equation of a conic referred to the focus, the half latus-rectum being $b^2 / a$. 

The law of the inverse cube \( P = \mu \, u^3 \) is interesting by way of contrast. The orbits may be divided into two classes according as \( h^2 a \), i.e. according as the transverse velocity \((hu)\) is greater or less than the velocity \( \sqrt{\mu} \) appropriate to a circular orbit at the same distance. In the former case the equation (17) takes the form

\[
\frac{d\theta}{dt} + \frac{m^2}{u} = 0,
\]

the solution of which is

\[
u = \sin m (\theta - \alpha).
\]

The orbit has therefore two asymptotes, inclined at an angle \( \pi/2 \). In the latter case the differential equation is of the form

\[
\frac{d\theta}{dt} = m\, \cos \theta,
\]

so that

\[
u = \sin m\, \theta,
\]

if \( A, B \) have the same sign, this is equivalent to

\[
u = \cos m\, \theta,
\]

if the origin of \( \theta \) be suitably adjusted; hence \( \rho \) has a maximum value \( a \), and the particle ultimately approaches the pole asymptotically by an infinite number of convolutions. If \( A, B \) have opposite signs the form is

\[
u = \sin m\, \theta,
\]

this has an asymptote parallel to \( \theta = 0 \), but the path near the origin has the same general form as in the case of (23). If \( A, B \) vanish we have an equiangular spiral, and the velocity at infinity is zero.

In the critical case of \( h^2 = \mu \rho \) we have \( \frac{d\theta}{dt} = 0, \) and

\[
u = \frac{A}{\theta} + \frac{B}{\theta},
\]

the orbit is therefore a "reciprocal spiral." except in the special case of \( A = 0 \), when it is a circle. It will be seen that unless the conditions be exactly adjusted for a circular orbit the particle will either recede to infinity or approach the pole asymptotically. This problem was investigated by R. Cotes (1682-1716), and the various curves obtained are known as \( Cote's \ spirals \).

A point on a central orbit where the radial velocity \( dr/dt \) vanishes is called an \( apse \), and the corresponding radius is called an \( apse-line \). If the force is always the same at the same distance any apse-line will divide the orbit symmetrically, as is seen by imagining the velocity at the apse to be reversed. It follows that the angle between successive apse-lines is constant; it is called the apsidal angle of the orbit.

If in a central orbit the velocity is equal to the velocity from infinity, we have, from (5),

\[
\frac{h^2}{P^2} = \frac{1}{m} \int_0^\infty P\, dt;
\]

this determines the form of the critical orbit, as it is called. If \( P = \mu > 0 \), its polar equation is

\[
r = \cos m\, \theta = a^n,
\]

where \( m = 1/2 - n \), except in the case \( n = 3 \), when the orbit is an equiangular spiral. The case \( n = 2 \) gives the parabola as before.

If we eliminate \( du/dt \) between (15) and (16) we obtain

\[
\frac{d\rho}{dt} = \frac{h^2}{m} - P = -f(\rho),
\]

say. We may apply this to the investigation of the stability of a circular orbit. Assuming that \( r = \alpha + \varepsilon \), where \( \alpha \) is small, \( \varepsilon \) may be approximated to

\[
\varepsilon \frac{d\varepsilon}{dt} = \frac{h^2}{m} \left( 1 - \frac{1}{n} \right) = -f(\alpha) = \frac{d^2 f(\alpha)}{d\alpha^2} \varepsilon.
\]

Hence if \( h \) and \( \alpha \) be connected by the relation \( h^2 = a^n f(\alpha) \) proper to a circular orbit, we have

\[
\varepsilon \frac{d\varepsilon}{dt} + \frac{df(\alpha)}{d\alpha} \varepsilon + f(\alpha) - \frac{d^2 f(\alpha)}{d\alpha^2} \varepsilon = 0.
\]

If the coefficient of \( \varepsilon \) be positive the variations of \( \varepsilon \) are simple-harmonic, and \( x \) can remain permanently small; the circular orbit is then said to be stable. The condition for this may be written

\[
\frac{df(\alpha)}{d\alpha} > 0,
\]

i.e. the intensity of the force in the region for which \( r = \alpha \), nearly, must diminish with increasing distance less rapidly than according to the law of the inverse cube. Again, the half-period of \( x \) is \( \pi \sqrt{1 + 3\, f(\alpha)} \), and since the angular velocity in the orbit is \( h/\alpha \), approximately, the apsidal angle is, ultimately,

\[
\tau = \sqrt{\frac{a^2 f(\alpha) + 3\, f(\alpha)}{a^2 (f(\alpha) + 3\, f(\alpha))}},
\]

or, in the case \( f(\alpha) = \mu/r \), \( \pi \sqrt{3 - n} \). This is in agreement with the known results for \( n = 2, -1 \).

We have seen that under the law of the inverse square all finite orbits are elliptical. The question presents itself whether there is any other law of force, giving a finite velocity from infinity, under which all finite orbits are necessarily closed curves. If this is the case, the apsidal angle must evidently be commensurable with \( \pi \), and since it cannot vary discontinuously the apsidal angle in a circular orbit must be constant. Equating the expression (39) to \( \pi/m \), we find that \( f(0) = C/a^n \), when \( n = -3 \). The force must therefore vary as a power of the distance, and \( m \) must be less than 3. Moreover, the case \( n = 2 \) is the only one in which the critical orbit (29) can be regarded as the limiting form of a closed curve. Hence the only law of force which satisfies the conditions is that of the inverse square.

At the beginning of § 13 the velocity of a moving point \( P \) was represented by a vector \( O\, V \) drawn from a fixed origin \( O \). The locus of the point \( V \) is called the hodograph (c.f.) and it appears that the velocity of the point \( V \) along the hodograph represents in magnitude and in direction the acceleration in the original orbit.

Thus in the case of a plane orbit, if \( \eta \) be the velocity of \( P, \varphi \) the inclination of the direction of motion to some fixed direction, the polar co-ordinates of \( V \) may be taken to be \( r, \varphi \), hence the velocities of \( V \) along and perpendicular to \( O \) will be \( dm/d\varphi \) and \( vd\varphi/dt \). These expressions therefore give the tangential and normal accelerations of \( P \); cf. § 13 (12).

In the motion of a projectile under gravity the hodograph is a vertical line described with constant velocity. In elliptic harmonic motion the velocity of \( P \) is parallel and proportional to the semi-diameter \( CD \) which is conjugate to the radius \( CP \); the hodograph is therefore an ellipse similar to the actual orbit. In the case of a central orbit described under the law of the inverse square we have \( v = h/SY = h, \, SY/b \), where \( S \) is the centre of force, \( SY \) is the perpendicular to the point \( P \), and \( Z \) is the point where \( SY \) meets the auxiliary circle again. Hence the hodograph is similar and similarly situated to the locus of \( Z \) (the auxiliary circle) turned about \( S \) through a right angle. This applies to an elliptic or hyperbolic orbit; the case of the parabolic orbit may be examined separately or treated as a limiting case.

The annexed fig. 70 exhibits the various cases, with the hodograph in its proper orientation. The pole \( O \) of the hodograph is inside on or outside the circle, according as the orbit is an ellipse, parabola or hyperbola. In any case of a central orbit the hodograph (when turned through a right angle) is similar and similarly situated to the "reciprocal polar" of the orbit with respect to the centre of force. Thus for a circular orbit with the centre of force at an eccentric point, the hodograph is a conic with the pole as focus. In the case of a particle oscillating under gravity on a smooth cycloid from rest at the cusp the hodograph is a circle through the pole, described with constant velocity.

§ 15. Kinetics of a System of Discrete Particles.—The momenta of the several particles constitute a system of localized vectors which, for purposes of resolving and taking moments, may be reduced like a system of forces in statics (§ 8). Thus taking any point \( O \) as base, we have first a linear momentum whose components referred to rectangular axes through \( O \) are

\[
\Sigma (m_1 x_1, \Sigma (m_2 y_2), \Sigma (m_3 z_3)), \]

(1) its representative vector is the same whatever point \( O \) be chosen.

Secondly, we have an angular momentum whose components are

\[
\Sigma (m_1 (x_2 - x_3), \Sigma (m_2 (x_2 - x_3)), \Sigma (m_3 (x_2 - x_3)), \]

(2) these being the sums of the moments of the momenta of the several particles about the respective axes. This is subject to the same relations as a couple in statics; it may be represented by a vector which will, however, in general vary with the position of \( O \).

The linear momentum is the same as if the whole mass were concentrated at the centre of mass \( G \), and endowed with the velocity of this point. This follows at once from equation (8) of § 11, if we imagine the two configurations of the system there referred to to be those corresponding to the instants \( t, t + \delta t \). Thus

\[
\Sigma (m_1 P_1 \overline{P_1}) = \Sigma (m_1 G_1 \overline{G_1}),
\]

(3) Analytically we have

\[
\Sigma (m_1 P_1 \overline{P_1}) = d\Sigma (m_1 \overline{P_1} \delta t) = \Sigma (m_1 \overline{P_1} \delta t)
\]

(4) with two similar formulæ.
For let $G'$ be a consecutive position of $G$. At the instant $t + \delta t$ the moment of the system are equivalent to a linear momentum represented by a localized vector $\Sigma(m)(\vec{m} + \delta \vec{m})$ in a line through $G'$ tangential to the path of $G'$, together with a certain angular momentum. Now the moment of this localized vector with respect to any axis through $G$ is zero, to the first order of $\delta t$, since the perpendicular distance of $G$ from the tangent line at $G'$ is of the order $(\delta t)^2$. Analytically we have from $(5)$,

\[
\frac{d}{dt} \Sigma(m)(\vec{m} + \delta \vec{m}) = \Sigma(m) \cdot \left( \frac{d\vec{m}}{dt} \right) + \frac{d}{dt} \Sigma(m)(\vec{m} + \delta \vec{m}) \tag{6}
\]

If we put $\vec{x}, \vec{y}, \vec{z} = 0$, the theorem is proved as regards axes parallel to Ox.

Next consider the kinetic energy of the system. If from a fixed point $O$ we draw vectors $O\vec{V}_1$, $O\vec{V}_2$, \ldots to represent the velocities of the several particles $m_1, m_2, \ldots$, and if we construct the vector

\[
\vec{O}\vec{K} = \frac{\Sigma(m.\vec{O}\vec{V})}{\Sigma(m)} \tag{7}
\]

this will represent the velocity of the mass-centre, by $(3)$. We find, exactly as in the proof of Lagrange's First Theorem (§ 11), that

\[
\frac{1}{2} \Sigma(m.\vec{O}\vec{V}) = \frac{1}{2} \Sigma(m.\vec{O}\vec{K})^2 + \frac{1}{2} \Sigma(m.\vec{K}\vec{V})^2 \tag{8}
\]

i.e. the total kinetic energy is equal to the kinetic energy of the whole mass supposed concentrated at G and moving with this point, together with the kinetic energy of the motion relative to $G$. The latter may be called the internal kinetic energy of the system. Analytically we have

\[
\frac{1}{2} \Sigma(m(\vec{\omega} + \vec{v} + \vec{a})) = \frac{1}{2} \Sigma(m) \cdot \left( \frac{(d\vec{v})^2}{dt} + \frac{(d\omega)}{dt} + \frac{(d\vec{a})^2}{dt} \right) + \frac{1}{2} \Sigma(m(\vec{\omega} + \vec{v} + \vec{a})) \tag{9}
\]

There is also an analogue to Lagrange's Second Theorem, viz. \[
\frac{1}{2} \Sigma(m.\vec{K}\vec{V}) = \frac{1}{2} \Sigma(m)\left(\frac{d\Sigma(m.\vec{v})}{dt}\right) \tag{10}
\]

which expresses the internal kinetic energy in terms of the relative velocities of the several pairs of particles. This formula is due to Möbius.

The preceding theorems are purely kinematical. We have now to consider the effect of the forces acting on the particles. These may be divided into two categories; we have first, the extraneous forces exerted on the various particles from without, and, secondly, the mutual or internal forces between the various pairs of particles. It is assumed that these latter are subject to the law of equality of action and reaction. If the equations of motion of each particle be formed separately, each such internal force will appear twice over, with opposite signs for its components, viz. as affecting the motion of each of the two particles between which it acts. The full working out is in general difficult, the comparatively simple problem of "three bodies," for instance, in gravitational astronomy being still unsolved, but some general theorems can be formulated.

The first of these may be called the Principle of Linear Momentum. If there are no extraneous forces, the resultant linear momentum is constant in every respect. For consider any two particles at $P$ and $Q$, acting on one another with equal and opposite forces in the line $PQ$. In the time $\delta t$ a certain impulse is given to the first particle in the direction (say) from $P$ to $Q$, whilst an equal and opposite impulse is given to the second in the direction from $Q$ to $P$. Since these impulses produce equal and opposite momenta in the two particles, the resultant linear momentum of the system is unaltered. If extraneous forces act, it is seen in like manner that the resultant linear momentum of the system is in any given time modified by the geometric addition of the total impulse of the extraneous forces. It follows, by the preceding kinematical theory, that the mass-centre $G$ of the system will move exactly as if the whole mass were concentrated there and were acted on by the extraneous forces applied parallel to their original directions. For example, the mass-centre of a system free from extraneous force will describe a straight line with constant velocity. Again, the mass-centre of a chain of
The second general result is the Principle of Angular Momentum. If there are no extraneous forces, the moment of momentum about any fixed axis is constant. For in time $d\theta$ the mutual action between two particles at $P$ and $Q$ produces equal and opposite moments in the line $PQ$, and these will have equal and opposite moments about the fixed axis. If extraneous forces act, the total angular momentum about any fixed axis is in time $d\theta$ increased by the total extraneous impulse about that axis. The kinematical relations above explained now lead to the conclusion that in calculating the effect of extraneous forces in an infinitely short time $d\theta$ we may take moments about an axis passing through the instantaneous position of $G$ exactly as if $G$ were fixed; moreover, the result will be the same whether in this process we employ the true velocities of the particles or merely their velocities relative to $G$. If there are no extraneous forces, or if the extraneous forces have zero moment about any axis through $G$, the vector which represents the resultant angular momentum relative to $G$ is constant in every respect. A plane through $G$ perpendicular to this vector has a fixed direction in space, and is called the invariant plane; it may sometimes be conveniently used as a plane of reference.

For example, if we have two particles connected by a string, the invariant plane passes through the string, and if $u$ be the angular velocity in this plane, the angular momentum is $m_1 r_1 v_1 + m_2 r_2 v_2$, where $r_1$, $r_2$ are the distances of $m_1$, $m_2$ from their mass-centre $G$. Hence if the extraneous forces (e.g. gravity) have zero moment about $G$, $u$ will be constant. Again, the tension $R$ of the string is given by

$$R = m_1 u_1 = \frac{m_1 m_2}{m_1 + m_2} v_2,$$

where $v_1 = r_1 + r_2$. Also by (10) the internal kinetic energy is

$$\frac{1}{2} \frac{m_1 m_2 v_2^2}{m_1 + m_2}.$$

The increase of the kinetic energy of the system in any interval of time will of course be equal to the total work done by all the forces acting on the particles. In many questions relating to systems of discrete particles the internal force $R_{pq}$ (which we shall reckon positive when attractive) between any two particles $m_p$, $m_q$ is a function only of the distance $r_{pq}$ between them. In this case the work done by the internal forces will be represented by

$$-\sum R_{pq} dr_{pq},$$

when the summation includes every pair of particles, and each integral is to be taken between the proper limits. If we write

$$V = \sum R_{pq} dr_{pq}, \quad (11)$$

when $r_{pq}$ ranges from its value in some standard configuration $A$ of the system to its value in any other configuration $P$, it is plain that $V$ represents the work which would have to be done in order to bring the system from rest in the configuration $A$ to rest in the configuration $P$. Hence $V$ is a definite function of the configuration $P$; it is called the internal potential energy. If $T$ denote the kinetic energy, we may say then that the sum $T + V$ is in any interval of time increased by an amount equal to the work done by the extraneous forces. In particular, if there are no extraneous forces $T + V$ is constant. Again, if some of the extraneous forces are due to a conservative field of force, the work which they do may be reckoned as a diminution of the potential energy relative to the field as in § 13.

§ 16. Kinetics of a Rigid Body. Fundamental Principles.—When we pass from the consideration of discrete particles to that of continuous distributions of matter, we require some physical postulate over and above what is contained in the Laws of Motion, in their original formulation. This additional postulate may be introduced under various forms. One plan is to assume that any body whatever may be treated as if it were composed of material particles, i.e. mathematical points endowed with inertia coefficients, separated by finite intervals, and acting on one another with forces in the lines joining them subject to the law of equality of action and reaction. In the case of a rigid body we must suppose that those forces adjust themselves so as to preserve the mutual distances of the various particles unaltered. On this basis we can predicate the principles of linear and angular momentum, as in § 15.

An alternative procedure is to adopt the principle first formally enunciated by J. Le R. d'Alembert and since known by his name. If $x$, $y$, $z$ be the rectangular co-ordinates of a mass-element $m$, the expressions $m x, m y, m z$ must be equal to the components of the total force on $m$, these forces being partly extraneous and partly forces exerted on $m$ by other mass elements of the system. Hence $(m x, m y, m z)$ is called the actual or effective force on $m$. According to d'Alembert's formulation, the extraneous forces together with the effective forces reversed fulfill the statical conditions of equilibrium. In other words, the whole assemblage of effective forces is statically equivalent to the extraneous forces. This leads, by the principles of § 8, to the equations

$$\Sigma (m x) = X, \quad \Sigma (m y) = Y, \quad \Sigma (m z) = Z,$$

$$\Sigma (m (y z - z y)) = L, \quad \Sigma (m (x z - x y)) = M, \quad \Sigma (m (x y - y x)) = N, \quad (1)$$

where $(X, Y, Z)$ and $(L, M, N)$ are the force—and couple—constituents of the system of extraneous forces, referred to $O$ as base, and the summations extend over all the mass-elements of the system. These equations may be written

$$\frac{d}{dt} \Sigma (m x) = X, \quad \frac{d}{dt} \Sigma (m y) = Y, \quad \frac{d}{dt} \Sigma (m z) = Z,$$

$$\frac{d}{dt} \Sigma (m (y z - z y)) = L, \quad \frac{d}{dt} \Sigma (m (x z - x y)) = M, \quad \frac{d}{dt} \Sigma (m (x y - y x)) = N, \quad (2)$$

and so express that the rate of change of the linear momentum in any fixed direction (e.g. that of Ox) is equal to the total extraneous force in that direction, and that the rate of change of the angular momentum about any fixed axis is equal to the moment of the extraneous forces about that axis. If we integrate with respect to $t$ between fixed limits, we obtain the principles of linear and angular momentum in the form previously given. Hence, whichever form of postulate we adopt, we are led to the principles of linear and angular momentum, which form in fact the basis of all our subsequent work. It is to be noticed that the preceding statements are not intended to be restricted to rigid bodies; they are assumed to hold for all material systems whatever. The peculiar status of rigid bodies is that the principles in question are in most cases sufficient for the complete determination of the motion, the dynamical equations (1 or 2) becoming an equation to the degrees of freedom (six) of a rigid solid, whereas in cases where the freedom is greater we have to invoke the aid of other supplementary physical hypotheses (cf. Elasticity; Hydromechanics).

The increase of the kinetic energy of a rigid body in any interval of time is equal to the work done by the extraneous forces acting on the body. This is an immediate consequence of the fundamental postulate, in either of the forms above stated, since the internal forces do on the whole no work. The statement may be extended to a system of rigid bodies, provided the mutual reactions consist of the stresses in inextensible links, or the pressures between smooth surfaces, or the reactions at rolling contacts (§ 9).

§ 17. Two-dimensional Problems.—In the case of rotation about a fixed axis, the principles take a very simple form. The position of the body is specified by a single co-ordinate, viz. the angle $\theta$ through which some plane passing through the axis and fixed in the body has turned from a standard position in space. Then $d\theta/dt = \omega$, say, is the angular velocity of the body. The angular momentum of a particle $m$ at a distance $r$ from the axis is $mr^2\theta$, and the total angular momentum is $\Sigma m r^2 \theta$, $\omega$ or $I \omega$, if $I$ denotes the moment of inertia (§ 11) about the axis. Hence if $N$ be the moment of the extraneous forces about the axis, we have

$$\frac{d}{dt}(I \omega) = N. \quad (1)$$

This may be compared with the equation of rectilinear motion of a particle, viz. $d/dt (M \dot{x}) = X$; it shows that I measures the inertia of the body as regards rotation, just as $M$ measures its inertia as regards translation. If $N = 0$, $\omega$ is constant.
As a first example, suppose we have a flywheel free to rotate about a horizontal axis, and if a weight \( m \) hangs by a vertical string of a suspending wire, or to a "bifilar" suspension. In the latter case, the body hangs by two vertical threads of equal length \( l \) in a plane through \( G \). The motion being assumed to be small, the tensions of the two strings may be taken to have their statical values \( mg, 2gh(a + b), \) \( Mg, (c + b), \) where \( a, b \) are the distances of \( G \) from the two threads. When the body is twisted through an angle \( \theta \) the threads make angles \( \alpha b(l, b)l \) with the vertical, and the moment of the tensions about the vertical through \( G \) is accordingly \(-K\theta, \) where \( K = Mg \theta l / 2 \).

For the determination of the motion it has only been necessary to use one of the dynamical equations. The remaining equations serve to determine the reactions of the rotating body on its bearings. Suppose, for example, that there are no extraneous forces. Take rectangular axes, of which \( Ox \) coincides with the axis of rotation. The angular velocity being constant, the effective force on a particle \( m \) at a distance \( r \) from \( O \) is \( mr^2 \) towards this axis, and its components are accordingly \(-\omega^2mr, -\omega^2rm, \) \( O. \) Since the reactions on the bearings must be statically equivalent to the whole system of effective forces, there will reduce to a force \((X, Y, Z)\) at \( O \) and a couple \((L, M, N)\) given by

\[
X = -\omega^2(mx), \quad Y = -\omega^2(my), \quad Z = 0, \quad L = \omega^2(mx), \quad M = -\omega^2(mx), \quad N = 0,
\]

where \( X, Y, Z \) refer to the mass-centre \( G. \) The reactions do not therefore reduce to a single force at \( O \) unless \( \Sigma(2xy) = 0, \) \( \Sigma(2yz) = 0, \) \( i.e. \) unless the axis of rotation be a principal axis of inertia \((\xi, \eta, \zeta)\) at \( O. \) In order that the force may vanish we must also have \( \xi, \eta, i.e. \) the mass-centre must lie in the axis of rotation.

These considerations are important in the "balancing" of machinery. We note further that if a body be free to turn about a fixed point \( O, \) there are three mutually perpendicular lines through this point about which it can rotate steadily, without further constraint. The theory of principal or "permanent" axes was first investigated from this point of view by J. A. Segner (1755). The origin of the name "deviation moment" sometimes applied to a product of inertia is also now apparent.

Proceeding to the general motion of a rigid body in two dimensions we may take as the three co-ordinates of the body the rectangular Cartesian co-ordinates \( x, y \) of the mass-centre \( G \) and the angle \( \theta \) through which the body has turned from some standard position. The components of linear momentum are then \( M\xi, \) \( M\eta, \) and the angular momentum relative to \( G \) as base is \( I\theta, \) where \( I \) is the mass and \( \theta \) the moment of inertia about \( G. \)

If the extraneous forces be reduced to a force \((X, Y)\) at \( G \) and a couple \( (N, M) \), we have

\[
M\theta = X, \quad M\xi = Y, \quad I\theta = N.
\]

If the extraneous forces have zero moment about \( G \) the angular velocity \( \theta \) is constant. Thus a circular disk projected under gravity in a vertical plane spins with constant angular velocity, whilst its centre describes a parabola.

We may apply the equations \((9)\) to the case of a solid of revolution rolling with its axis horizontal on a plane of inclination \( a. \) If the axis of the disk be taken parallel to the slope of the plane, with \( x \) increasing downwards, we have

\[
M\theta = Mg \sin a, \quad F = Mg \cos a - R, \quad M\xi = Fa
\]

where \( x \) is the radius of gyration of the body, \( a \) being the constant distance of \( G \) from the plane, and \( R, F \) are the normal and tangential components of the reaction of the plane, as shown in fig. 74. We have also the kinematical relation \( \xi = \bar{\xi}. \) Hence

\[
\bar{x} = \xi - q x \sin a, \quad \bar{R} = Mg \cos a, \quad F = \frac{x^2}{r^2}Mg \sin a.
\]

The acceleration of \( G \) is therefore less than in the case of frictionless sliding in the ratio \( a^2/(a^2 + \theta). \) For a homogeneous sphere this ratio is \( \theta \), for a uniform circular cylinder or disk \( \xi, \) for a circular hoop or a thin cylindrical shell \( 4. \)

The equation of energy for a rigid body has already been stated (in effect) as a corollary from fundamental assumptions.
It may also be deduced from the principles of linear and angular momentum as embodied in the equations (9). We have:

$$M(2\dd + 3\dd) + 1\dd + Xx + Yy + N\dd;$$

where $$\dd$$, $$\dd$$, $$\dd$$ are the co-ordinates of the point of contact (C) as instantaneous axis, and the potential energy is $$-Mgh \cos \theta$$. The equation of motion is therefore

$$\dd M(\dd^2 + \dd^2 + 2k^2 - 2a \dd \cos \theta) \dd = -Mgh \cos \theta - \text{const.}$$

(14)

Whenever, as in the preceding examples, a body or a system of bodies, is subject to constraints which leave it virtually only one degree of freedom, the equation of motion is sufficient for the complete determination of the motion. If $$q$$ be any variable co-ordinate defining the position or (in the case of a system of bodies) the configuration, the velocity of each particle at any instant will be proportional to $$\dd$$ and the total kinetic energy may be expressed in the form $$\dd A_{ij} \dd^2$$, where $$A_{ij}$$ is in general a function of $$q$$ [cf. equation (14)]. This coefficient $$A_{ij}$$ is called the coefficient of inertia, or the reduced inertia of the system, referred to the co-ordinate $$q$$.

Thus in the case of a railway truck travelling with velocity $$u$$ the kinetic energy is $$\frac{1}{2}(M + \frac{1}{2}u^2)^2$$, where $$M$$ is the total mass, $$a$$ the radius of the wheels and $$\dd$$ the radius of gyration of each wheel, and $$M$$ is the sum of the masses of the wheels; the reduced inertia is therefore $$\frac{1}{2}M^2$$.

Again, take the system composed of the flywheel, connecting rod, and piston of a steam-engine. We have here a limiting case of the system of three-bar motion (§ 3), and the instantaneous centre of the connecting-rod PQ will have the position shown in the figure. The velocities of End Q will be in the ratio of $$PQ : QO$$ or OR to OQ; the velocity of the piston is therefore $$\dd$$, where $$\dd = \text{OR}$$.

Hence it is clear, that the inertia of the connecting-rod is the kinetic energy will be $$\frac{1}{2}(M + K^2)\dd$$, where $$I$$ is the moment of inertia of the flywheel, and $$M$$ is the mass of the piston. The effect of the mass of the piston is therefore to increase the apparent moment of inertia of the flywheel by the variable amount $$M^2$$. If, on the other hand, we take OP (= $$x$$) for our variable, the kinetic energy is $$\frac{1}{2}(M + 1\dd^2)^2$$. We may also say, therefore, that the effect of the flywheel is to increase the apparent mass of the piston by the amount $$1\dd^2$$; this becomes infinite at the "deadpoints" where the crank is in line with the connecting-rod.

If the system be "conservative", we have

$$A\dd + 1\dd + Xx + Yy = \text{const.},$$

(15)

where $$V$$ is the potential energy. If we differentiate this with respect to $$t$$, and divide out by $$\dd$$, we obtain

$$A\dd + 1\dd + Xx + Yy = \text{const.},$$

(16)

as the equation of motion of the system with the unknown reactions (if any) eliminated. For equilibrium this must be satisfied by $$\dd = 0$$; this requires that $$dV/d\dd = 0$$, i.e. the potential energy must be "stationary." To examine the effect of a small disturbance from equilibrium we put $$V = f(\dd)$$, and write $$\dd = q_0 + \dd$$, where $$q_0$$ is a root of $$f(\dd) = 0$$ and $$\dd$$ is small. Neglecting terms of the second order in $$\dd$$ we have $$dV/d\dd = f'(\dd) = f'(\dd)\dd$$, and the equation (16) reduces to

$$A\dd + f'(\dd)\dd = 0,$$

(17)

where $$A$$ may be supposed to be constant and to have the value corresponding to $$\dd = q_0$$. Hence if $$f'(\dd) > 0$$, i.e. if $$V$$ is a minimum in the configuration of equilibrium, the variation of $$\dd$$ is small-harmonic, and the period is $$2\pi \sqrt{A/f'(\dd)}$$. This depends only on the constitution of the system, whereas the amplitude and cycle will vary with the initial circumstances. If $$f'(\dd) < 0$$, the solution of (17) will involve real exponentials, and $$\dd$$ will in general increase until the neglect of the terms of the second order is no longer justified.

The configuration $$\dd = q_0$$, is then unstable.

As an example of the method, we may take the problem in which the rolling-particle, or on a horizontal plane. This includes the case of a compound pendulum in which the knife-edge is replaced by a cylindrical pin. If $$\dd$$ be the radius of the cylinder, $$h$$ the distance of C from its axis (O), $$\dd$$ the radius of gyration about a longitudinal axis through C, and $$\dd^2$$ the inclination of OC to the vertical, the kinetic energy is $$\dd M\dd^2 + \dd M^2 \dd^2$$, by § 3, since the motion is in a plane, the radius of gyration is $$\dd$$, and the potential energy is $$-Mgh \cos \dd$$.

The equation of motion is therefore

$$\dd M(\dd^2 + \dd^2 + 2k^2 - 2a \dd \cos \dd) \dd = -Mgh \cos \dd - \text{const.}$$

The equations which express the change of motion (in two dimensions) due to an instantaneous impulse are of the forms

$$M\dd^2 = \dd, \quad M\dd^2 + \dd = \dd, \quad I\dd = \dd,$$

(18)

where the length of the equivalent simple pendulum is $$\dd$$.

The equations which express the change of motion (in two dimensions) due to an instantaneous impulse are of the forms

$$M\dd^2 = \dd, \quad M\dd^2 + \dd = \dd, \quad I\dd = \dd,$$

(18)

where the length of the equivalent simple pendulum is $$\dd$$.

Here $$u', v'$$ are the values of the component velocities of G just before, and $$u, v$$ their values just after, the impulse, whilst $$u'', v''$$ denote the corresponding angular velocities. Further, $$\xi, \eta$$ are the time-integrals of the forces parallel to the co-ordinate axes, and $$\gamma$$ is the time-integral of their moment about G.

If $$\dd$$ be a rigid lamina at rest, but free to move, is struck by an instantaneous impulse, then is produced an instantaneous impulse. If $$\dd$$ be a rigid lamina at rest, but free to move, is struck by an instantaneous impulse, then is produced an instantaneous impulse. If $$\dd$$ be a rigid lamina at rest, but free to move, is struck by an instantaneous impulse, then is produced an instantaneous impulse.

The initial centre of rotation will therefore be at C, provided GC. GP = $$\dd$$. If this condition is satisfied there would be no impulsive reaction at C even if this point were fixed. The point P is therefore called the "centre of percussion" for the axis at C. It will be noted that the relation between C and P is the same as that which connects the centre of suspension and oscillation in the compound pendulum.

§ 18. Equations of Motion in Three Dimensions.—It is proved in § 7 that a body moving about a fixed point O can be brought from its position at time $$t$$ to its position at time $$t + \dd$$ by an infinitesimal rotation about some axis through O; and the limiting position of this axis, when $$\dd$$ is infinitely small, was called the "instantaneous axis." The limiting value of the ratio $$\dd$$ was the "angular velocity" of the body; we denote it by $$\omega$$. If $$\xi, \eta, \zeta$$ are the components of $$\omega$$ about rectangular co-ordinate axes through O, the limiting values of $$\dd$$ are called the "component angular velocities"; we denote them by $$\dd, \dd, \dd$$.

If I, m, n be the direction-cosines of the instantaneous axis we have

$$\dd = \dd, \quad \dd = \dd, \quad \dd = \dd,$$

(1)

(2)

If we draw a vector OP to represent the angular velocity, then J traces out a certain curve in the body, called the "polehode," and a certain curve in space, called the "herpolhode." The and in space are called the polehode and herpolhode cones, respectively; in the actual motion the former cone rolls on the latter ($$\dd$$).
The special case where both cones are right circular and \( \omega \) is constant is important in astronomy and also in mechanism (theory of bevel wheels). The "precession of the equinoaxes" is due to the fact that the earth performs a motion of this kind about its centre, and the whole class of such motions has therefore been termed "precessional." In fig. 78, which shows the various cases, \( OZ \) is the axis of the fixed and \( OC \) that of the rolling cone, and \( J \) is the point of contact of the polhode and hyperbolid, which are of course both circles. If \( \alpha \) be the semi-angle of the rolling cone, \( \beta \) the constant inclination of \( OC \) to \( OZ \), and \( \psi \) the angular velocity with which the plane \( ZOC \) revolves about \( OZ \), then, considering the velocity of a point in \( OC \) at unit distance from \( O \), we have

\[
\omega \sin \alpha = \psi \sin \beta, \quad (3)
\]

where the lower sign belongs to the third case. The earth's precessional motion is of this latter type, the angles being \( \alpha = 0^\circ 08^\prime 7^\prime \prime, \beta = 23^\circ 28^\prime 6^\prime \). If \( m \) be a particle at \( P \), and \( PN \) the perpendicular to the instantaneous axis, the kinetic energy \( T \) is given by

\[
2T = \Sigma (m(\omega \cdot PN)')^2 = m(\omega \cdot PN)^2 = I_0^2, \quad (4)
\]

where \( I_0 \) is the moment of inertia about the instantaneous axis. With the same notation for moments and products of inertia as in \( \S \ 38 \) (38), we have

\[
I = \Sigma p^2 + \Sigma r^2 - 2 \Sigma mnr - 2Gnl - 2Hlm,
\]

and therefore by (1),

\[
2T = \Lambda p^2 + \Sigma B q^2 + \Sigma C r^2 - 2F np - 2G nq - 2H nr. \quad (5)
\]

Again, if \( x, y, z \) be the co-ordinates of \( P \), the component velocities of \( m \) are

\[
x = \omega \sin \alpha \sin \beta \cos \gamma + \omega \cos \gamma, \quad (6)
\]

by \( \S \ 7 \) (5); hence, if \( \lambda, \mu, \nu \) be now used to denote the component angular momenta about the co-ordinate axes, we have

\[
\lambda = \frac{Ap}{\eta} - Hq - G r = \frac{\partial T}{\partial p}, \quad (7)
\]

\[
\mu = \frac{-H p + B q - F r}{\eta} = \frac{\partial T}{\partial q} \quad \nu = \frac{-G p - B q + F r}{\eta} = \frac{\partial T}{\partial r},
\]

If the co-ordinate axes be taken to coincide with the principal axes of inertia at \( O \), at the instant under consideration, we have the simpler formulae

\[
2T = \Lambda p^2 + \Sigma B q^2 + \Sigma C r^2, \quad (8)
\]

\[
\lambda = \Lambda p, \mu = B q, \nu = C r. \quad (9)
\]

It is to be carefully noticed that the axis of resultant angular momentum about \( O \) does not in general coincide with the instantaneous axis of rotation. The relation between these axes may be expressed by means of the momental ellipsoid at \( O \). The equation of the latter, referred to its principal axes, being as in \( \S \ 11 \) (41), the co-ordinates of the point \( J \) where it is met by the instantaneous axis are proportional to \( p, q, r \), and the direction-cosines of the normal at \( J \) are therefore proportional to \( Ap, B q, C r \), or \( \lambda, \mu, \nu \). The axis of resultant angular momentum is therefore normal to the tangent plane at \( J \), and does not coincide with \( OJ \) unless the latter be a principal axis. Again, if \( \Gamma \) be the resultant angular momentum, so that

\[
\lambda^2 + \mu^2 + \nu^2 = \Gamma^2, \quad (10)
\]

the length of the perpendicular \( OH \) on the tangent plane at \( J \) is

\[
OH = \frac{Ap}{\Gamma} \frac{B q}{\Gamma} + \frac{C r}{\Gamma} = \frac{p^2 + q^2 + r^2}{\Gamma} \quad (11)
\]

where \( p = OJ \). This relation will be of use to us presently (\( \S \ 10 \)).

The motion of a rigid body in the most general case may be specified by means of the component velocities \( u, v, w \) of any point \( O \) of it which is taken as base, and the component angular velocities \( \rho, \varphi, \psi \). The component velocities of any point whose co-ordinates relative to \( O \) are \( x, y, z \) are then

\[
u + gx - r, \; v + px - q, \; w + py - qx. \quad (12)
\]

It is usually convenient to take as our base-point the mass-centre of the body. In this case the kinetic energy is given by

\[
2T = M_0 (u^2 + v^2 + w^2) + \overline{AP} + \overline{Bq} + \overline{Cr} - 2Fq = 2FRp - 2Grp - 2Hpr. \quad (13)
\]

where \( M_0 \) is the mass, and \( A, B, C, F, G, H \) are the moments and products of inertia with respect to the mass-centre; cf. \( \S \ 15 \) (9).

The components \( \xi, \eta, \zeta \) of linear momentum are

\[
\xi = M_0 w \frac{\partial T}{\partial u}, \; \eta = M_0 w \frac{\partial T}{\partial v}, \; \zeta = M_0 w \frac{\partial T}{\partial r}. \quad (14)
\]

where those of the relative angular momentum are given by (7). The preceding formulæ are sufficient for the treatment of instantaneous impulses. Thus if an impulse \( (\xi, \eta, \zeta, \lambda, \mu, \nu) \) change the motion from \( (u, v, w, p, q, r) \) to \( (u', v', w', p', q', r') \) we have

\[
M_0 (u' - u) = \xi, \; M_0 (v' - v) = \eta, \; M_0 (w' - w) = \zeta, \quad (15)
\]

\[
A(p' - p) = \lambda, \; B(q' - q) = \mu, \; C(r' - r) = \nu. \quad (16)
\]

The factors of \( \xi, \eta, \zeta, \lambda, \mu, \nu \) on the right-hand side are proportional to the constituents of a possible infinitesimal displacement of the solid, and the whole expression is proportional (on the same scale) to the work done by the given system of impulsive forces in such a displacement. As in \( \S \ 9 \) this must be equal to the total work done in such a displacement by the several forces, whatever they are, which make up the impulse.

We are thus led to the following statement: the change of kinetic energy due to any system of impulsive forces is equal to the sum of the products of the several forces into the sum of the initial and final velocities of their respective points of application, resolved in the directions of the forces. Thus in the problem of fig. 77 the kinetic energy generated is \( 2M(A' x + C' y) \omega^2 \), if \( C \) be the instantaneous centre; this is seen to be equal to \( 2F \omega' \cdot CP \); where \( \omega' \cdot CP \) represents the initial velocity of \( P \).

The equations of continuous motion of a solid are obtained by substituting the values of \( \xi, \eta, \zeta, \lambda, \mu, \nu \) from (14) and (7) in the general equations

\[
\frac{d\xi}{dt} = X, \quad \frac{d\eta}{dt} = Y, \quad \frac{d\zeta}{dt} = Z, \quad (17)
\]

\[
\frac{d\lambda}{dt} = L, \quad \frac{d\mu}{dt} = M, \quad \frac{d\nu}{dt} = N, \quad (18)
\]

where \( X, Y, Z, L, M, N \) denotes the system of extraneous forces referred (like the momenta) to the mass-centre as base, the co-ordinate axes being of course fixed in direction. The resulting equations are not as a rule easy of application, owing to the fact that the moments and products of inertia \( A, B, C, F, G, H \) are not constants but vary in consequence of the changing orientation of the body with respect to the co-ordinate axes.

An exception occurs, however, in the case of a solid which is kinetically symmetrical (\( \S \ 11 \)) about the mass-centre, e.g. a uniform sphere. The equations then take the forms

\[
M_0 = X, \; M_0 = Y, \; M_0 = Z, \quad (19)
\]

\[
C_p = L, \quad C_q = M, \quad C_r = N, \quad (20)
\]

where \( C \) is the constant moment of inertia about any axis through
We parallel inclination parallel (P, Q, R) to the point of contact. Hence

\[ \begin{align*}
M_{Ox} &= x + F_x, \\
M_{Oy} &= y + F_y, \\
\omega &= z + R, \\
\begin{cases}
C_P = F_{xR}, \\
C_Q = -F_{zR}, \\
C_T = 0.
\end{cases}
\end{align*} \]

The last equation shows that the angular velocity about the normal is to the plane is constant. Again, since the point of the sphere which is in contact with the plane is instantaneously at rest, we have the geometrical relations

\[ \begin{align*}
\mathbf{u} + \mathbf{v} + \omega = 0, \\
\mathbf{v} + \mathbf{a}_o = \mathbf{v}_o, \\
\mathbf{w} = 0, \\
\end{align*} \]

by (12). Eliminating \( \mathbf{p}, \mathbf{q} \), we get

\[ (M + Ca^2)\mathbf{a}_o = \mathbf{X}, \quad (M + Ca^2)\mathbf{a}_o = \mathbf{Y}. \]

The acceleration of the centre is therefore the same as if the plane were smooth and the mass of the sphere were increased by \( C/\mathbf{a}_o \). Thus, the course of a sphere rolling under gravity on a plane of inclination \( \alpha \) describes a parabola with an acceleration

\[ \mathbf{g} \sin \alpha / (1 + C/Ma^2) \]

parallel to the lines of greatest slope.

Next take the case of a sphere rolling on a fixed spherical surface. Let \( \alpha \) be the radius of the rolling sphere, \( \mathbf{e} \) of the spherical surface which is the locus of its centre, and let \( \mathbf{x}, \mathbf{y}, \mathbf{z} \) be the co-ordinates of this centre relative to axes through \( O \), the centre of the fixed sphere. If the only external forces are the reactions \( \mathbf{P}, \mathbf{Q}, \mathbf{R} \) at the point of contact, we have

\[ \begin{align*}
M_{Ox} &= \mathbf{P}, \\
M_{Oy} &= \mathbf{Q}, \\
M_{Oz} &= \mathbf{R}, \\
\begin{cases}
C_P = -\frac{d}{d} (\mathbf{P} - \mathbf{R}), \\
C_Q = -\frac{d}{d} (\mathbf{P} - \mathbf{Q}), \\
C_T = -\frac{d}{d} (\mathbf{Q} - \mathbf{R}).
\end{cases}
\end{align*} \]

This is the standard case where the center of the rolling sphere is outside the fixed sphere. The opposite case is obtained by reversing the sign of \( a \). We have also the geometrical relations

\[ \mathbf{z} = \mathbf{z} / (a^2 - r^2), \quad \mathbf{y} = (a^2 - r^2) / (a^2 - r^2), \quad \mathbf{x} = (a^2 - r^2) / (a^2 - r^2). \]

If we eliminate \( P, Q, R \) from (23), the resulting equations are integrable with respect to \( t \); thus

\[ \begin{align*}
\begin{cases}
\mathbf{p} = -\frac{Ma_o}{C} (a^2 - r^2), \\
\mathbf{q} = -\frac{Ma_o}{C} (a^2 - r^2), \\
\mathbf{r} = \frac{Ma_o}{C} (a^2 - r^2), \\
\end{cases}
\end{align*} \]

where \( \mathbf{a}, \mathbf{b}, \mathbf{c} \) are arbitrary constants. Substituting in (23) we find

\[ \begin{align*}
(1 + \frac{Ma_o}{C}) \mathbf{a} = \mathbf{a} \mathbf{b} - \mathbf{r}, \\
(1 + \frac{Ma_o}{C}) \mathbf{a} = \mathbf{a} \mathbf{c} - \mathbf{r}, \\
(1 + \frac{Ma_o}{C}) \mathbf{b} = \mathbf{b} \mathbf{c} - \mathbf{r}.
\end{align*} \]

Hence \( \mathbf{a} \mathbf{b} + \mathbf{b} \mathbf{c} + \mathbf{c} \mathbf{a} = \mathbf{r} \),

which shows that the centre of the rolling sphere describes a sphere if the axis of \( z \) be taken normal to the plane of this circle we have

\[ \begin{align*}
\begin{cases}
\mathbf{a} = \frac{\mathbf{r}}{1 + \frac{Ma_o}{C}}, \\
\mathbf{b} = \frac{\mathbf{r}}{1 + \frac{Ma_o}{C}}, \\
\mathbf{c} = \frac{\mathbf{r}}{1 + \frac{Ma_o}{C}}.
\end{cases}
\end{align*} \]

The solution of these equations is of the type

\[ \mathbf{x} = \frac{b \cos \mathbf{a} + \mathbf{c} \mathbf{y}}{1 + \mathbf{a} \mathbf{b}} \]

where \( \mathbf{a}, \mathbf{b}, \mathbf{c} \) are arbitrary, and

\[ \mathbf{r} = \mathbf{a} \mathbf{b} + \mathbf{b} \mathbf{c} + \mathbf{c} \mathbf{a}.
\]

where \( \mathbf{r} \) is the resultant angular moment of \( \mathbf{b} \). Since \( \mathbf{b} \) varies as \( \mathbf{b} \), it follows that \( \mathbf{OH} \) is constant, and the tangent plane at \( J \) is therefore fixed in space. The motion of the body relative to \( O \) is therefore completely represented if we imagine the momental ellipsoid at \( O \) to roll without sliding on a plane fixed in space, with an angular velocity proportional at each instant to the radius-vector of the point of contact. The fixed plane is parallel to the invariable plane at \( O \), and the line \( OH \) is called the instant axis. The trace of the point of contact \( J \) on the fixed plane is the "herpolhode."

If \( p, q, r \) be the component angular velocities about the principal axes at \( O \), we have

\[ \begin{align*}
\begin{cases}
(\mathbf{A} + \mathbf{B} + \mathbf{C}) (\mathbf{A} + \mathbf{B} + \mathbf{C}) & = (\mathbf{A} + \mathbf{B} + \mathbf{C}) (\mathbf{A} + \mathbf{B} + \mathbf{C}) \mathbf{r}, \\
\end{cases}
\end{align*} \]

each side being in fact equal to unity. At a point on the polhode cone \( x + y = \mathbf{p} \mathbf{r}, \) and the equation of this cone is therefore

\[ \begin{align*}
\begin{cases}
A' (x - \frac{1}{2A}) + B' (x - \frac{1}{2B}) + C' (x - \frac{1}{2C}) = 0.
\end{cases}
\end{align*} \]

Since \( 2 \mathbf{B} = \mathbf{B} (\mathbf{A} + \mathbf{B} + \mathbf{C}) \mathbf{C} (\mathbf{A} + \mathbf{C} + \mathbf{C}) \mathbf{r} \), it appears that if \( \mathbf{A} + \mathbf{B} + \mathbf{C} \) the coefficient of \( \mathbf{x}^2 \) in (4) is positive, that \( \mathbf{x}^2 \) is negative, whilst that of \( \mathbf{x}^2 \) is positive or negative according as \( \mathbf{x}^2 \) is positive. Hence the polhode curve in the fixed plane is obviously confined between two concentric circles which it alternately touches; it is not in general a re-entrant curve. It has been shown by De Sparre that, owing to the limitation imposed on the possible forms of the momental ellipsoid by the relation \( \mathbf{B} + \mathbf{C} \mathbf{A} \), the curve has no points of inflexion. The invariable line \( OH \) describes another cone in the
body, called the *invariable cone*. At any point of this we have 
\[ x : y : z = \lambda \phi. \] 
By: \(Cr_3\), and the equation is therefore 
\[ (1 - 2 \alpha \kappa) \phi^2 + (1 - 2 \beta \kappa) \psi^2 + (1 - 2 \gamma \kappa) \rho^2 = 0. \] 

The signs of the coefficients follow the same rule as in the case of (a). The possible forms of the invariable cone are indicated in fig. 80 by means of the intersections with a concentric spherical surface. In the critical case of 
\[ 2 \alpha = 1 \] the cone degenerates into two planes. It appears that if the body be slightly disturbed from a state of rotation about the principal axis of greatest or least moment, the invariable cone will closely sur-round this axis, which will therefore never deviate far from the invariable line. If, on the other hand, the body be slightly disturbed from a state of rotation about the mean axis, a wide deviation will take place.

Hence a rotation about the axis of greatest or least moment is reckoned as stable, a rotation about the mean axis as unstable. The question is greatly simplified when two of the principal moments are equal, say \(A = B\). The polhode and herpolhode cones are then right circular, and the motion is "precessional" according to the definition of § 18. If \(a, b, c\) be the inclination of the instantaneous axis to the axis of symmetry, \(\beta\) the inclination of the latter to the invariable line, we have
\[ \cos \beta = \cos a, \quad \sin \beta = \sin a, \] 
whence
\[ \tan \beta = \tan a. \] 

Hence \(\beta \geq a\), and the circumstances are therefore those of the first or second case in fig. 78, according as \(A \geq C\). If \(\psi\) be the rate at which the plane \(HOJ\) revolves about \(O\), we have
\[ \psi = \frac{\sin a}{\cos \beta} = \frac{\cos \alpha}{\cos \beta}, \] 
by § 18 (3). Also if \(\chi\) be the rate at which \(J\) describes the polhode, we have \(\psi \sin (\beta - a) = \chi \sin \beta\), whence
\[ \chi = \frac{\sin (a - \beta)}{\cos \alpha}. \] 

If the instantaneous axis only deviate slightly from the axis of symmetry the angles \(a, \beta, \chi\) are small, and \(\chi = (A - C) A, \omega\); the instantaneous axis therefore completes its revolution in the body in the period
\[ 2\pi = \frac{A - C}{A} \omega. \] 

In the case of the earth it is inferred from the independent phenomenon of lunisolar precession that \((C - A)/A = 0.0313\). Hence if the earth's axis of rotation deviates slightly from the axis of figure, it should describe a cone about the latter in 320 sidereal days. This would cause a periodic variation in the latitude of any place on the earth's surface, as determined by astronomical methods. There appears to be evidence of a slight periodic variation of latitude, but the period would seem to be about fourteen months. The discrepancy is attributed to a defect of rigidity in the earth. The phenomenon is known as the *Bulian mutation*, since it is supposed to come under the free rotations first discussed by Euler.

§ 20. **Motion of a Solid of Revolution.**—In the case of a solid of revolution, or (more generally) whenever there is kinetic symmetry about an axis the mass-centre, or through a fixed point \(O\), a number of interesting problems can be treated almost directly from first principles. It frequently happens that the extraneous forces have zero moment about the axis of symmetry, as e.g. in the case of the flywheel of a gyroscope if we neglect the friction at the bearings. The angular velocity \(\omega\) about this axis is then constant. For we have seen that \(\omega\) is constant when there are no extraneous forces; and \(\omega\) is evidently not affected by an instantaneous impulse which leaves the angular momentum \(Cr_3\), about the axis of symmetry, unaltered. And a continuous force may be regarded as the limit of a succession of infinitesimal instantaneous impulses.

Suppose, for example, that a flywheel is rotating with angular velocity \(\omega\) about its axis, which is (say) horizontal, and that this axis is made to rotate with the angular velocity \(\phi\) in the horizontal plane. The components of angular momentum about the axis of the flywheel and about the vertical will be \(Cn\), and \(A\phi\) respectively, where \(A\) is the moment of inertia about any axis through the mass-centre (or through the fixed point \(O\)) perpendicular to that of symmetry.

If \(\vec{OB}\) be the vector representing the former component at time \(t\), the vector which represents it at time \(t + \delta t\) will be \(\vec{OE}\), equal to \(\vec{OB}\) in magnitude and making with it an angle \(\phi\delta t\). Hence \(KB = (Cn\phi\delta t)\) will represent the change in this component due to the extraneous forces. Hence, so far as this component is concerned, the extraneous forces must supply a couple of moment \(Cn\phi\delta t\) in a vertical plane through the axis of the flywheel. If this couple be absent, the axis \(\vec{OF}\) will be tilted out of the horizontal plane in such a sense that the direction of the spin \(n\) approximately to that of the azimuthal rotation \(\phi\). The remaining component of the extraneous forces is a couple \(AV\) about the vertical; this vanishes if \(\phi\) is constant. If the axis of the flywheel make an angle \(\theta\) with the vertical, it is seen in like manner that the required couple in the vertical plane through the axis is \(Cn\sin \theta \phi\). This matter can be strikingly illustrated with an ordinary gyroscop, e.g. by making the larger movable ring in fig. 37 rotate about its vertical diameter.

If the direction of the axis of kinetic symmetry be specified by means of the angular co-ordinates \(\theta, \phi\) of § 7, then considering the component velocities of the point \(C\) in fig. 83, which are \(\theta\) and \(\phi\phi\) along and perpendicular to the meridian \(ZC\), we see that the component angular velocities about the lines \(OA', OB'\) are \(-\sin \theta \phi\) and \(\sin \theta \phi\) respectively. Hence if the principal moments of inertia at \(O\) be \(A, B, C\), and if \(n\) be the constant angular velocity about the axis \(OC\), the kinetic energy is given by
\[ \frac{1}{2} \omega^2 = A(B + \sin^2 \phi) + Cn\phi. \] 

Again, the components of angular momentum about \(OC, OA'\) are \(Cn, -A\sin \phi\), and therefore the angular momentum (\(\mu\), say) about \(OZ\) is
\[ \mu = A\sin \theta \phi + Cn\cos \theta. \] 

We can hence deduce the condition of steady precessional motion in a top. A solid of revolution is supposed to be free to turn about a fixed point \(O\) on its axis of symmetry, its mass-centre \(G\) being in this axis at a distance \(h\) from \(O\). In fig. 83 \(OC\) is supposed to be vertical, and the angle drawn in the direction \(OG\). If \(\theta\) is constant the points \(C, A\) will in time \(t\) come to positions \(C', A'\) such that \(CC' = \sin \phi \phi, AA' = \cos \phi \phi\); and the angular momentum about \(OB\) will become \(Cn\sin \phi \phi - A\sin \phi \psi\cos \phi \phi\). Equating this to \(Mgh\sin \theta \phi\), and dividing out by \(\sin \theta \phi\), we obtain
\[ \frac{1}{2} \omega^2 = Cn\psi + Mgh = 0, \] 

as the condition in question. For given values of \(n\) and \(\theta\) we have two possible values of \(\psi\) provided \(n\) exceed a certain limit. With a very rapid spin (more precisely) with \(Cn\) large in comparison with \(\sqrt{A(Mgh \cos \phi)}\), one value of \(\psi\) is small and the other large, viz. the two values are \(Mgh/Cn\) and \(Cn/A\cos \phi\) approximately. The absence of \(g\) from the latter expression indicates that the circumstances of the rapid precession are very
in particular they will make with Ox' angles whose cosines are, to the first order, $1, -\omega \theta, \omega \theta$, respectively. Hence the altered angular momentum about Ox' will be $\lambda + \omega \theta + (\mu + \nu)(-\omega \theta) + \nu \omega \theta$. If \( L, M, N \) be the moments of the extraneous forces about Ox, Oy, Oz this must be equal to $\lambda + \omega \theta \cdot L$. Hence, and by symmetry, we obtain

\[
\begin{align*}
\frac{da}{dt} - ru + qv &= L, \\
\frac{db}{dt} - pv + rw &= M, \\
\frac{dA}{dt} - e - q \omega &= N.
\end{align*}
\]

These equations are applicable to any dynamical system whatever. If we now apply them to the case of a rigid body moving about a fixed point O, and make Ox, Oy, Oz coincide with the principal axes of inertia at O, we have $\lambda, \mu, \nu = \Delta p, Bq, Cr$, whence

\[
\begin{align*}
A\frac{dp}{dt} - (B - C)q r &= L, \\
B\frac{dr}{dt} - (C - A)p r &= M, \\
C\frac{dp}{dt} - (A - B)q p &= N.
\end{align*}
\]

which is (virtually) the equation of energy.

As a first application of the equations (2) take the case of a solid constrained to rotate with constant angular velocity $\omega$ about a fixed axis ($l, m, n$). Since $\rho, q, r$ are then constant, the requisite constraining couple is

\[
L = (C - B)\mu \omega^2, M = (A - C)\nu \omega^2, N = (B - A)\mu \omega^2.
\]

If we reverse the signs, we get the " centrifugal couple " exerted by the solid on its bearings. This couple vanishes when the axis of rotation is a principal axis at O, and in no other case (cf. § 17).

If in (2) we put, $L, M, N = 0$ we get the case of free rotation; thus

\[
\begin{align*}
A\frac{dp}{dt} &= (B - C)q r, \\
B\frac{dr}{dt} &= (C - A)p r, \\
C\frac{dp}{dt} &= (A - B)q p.
\end{align*}
\]

These equations are due to Euler, with whom the conception of moving axes, and the application to the problem of free rotation, originated. If we multiply them by $\rho, q, r$, respectively, or again by $A\rho, Bq, Cr$ respectively, and add, we verify that the expressions $A^2 + 2B^2 + 2C^2$ and $A^2 + B^2 + C^2$ are both constant. The former is, in fact, equal to $2T$, and the latter to $I_T$, where $T$ is the kinetic energy and $I_T$ the resultant angular momentum.

To complete the solution of (2) a third integral is required; this involves in general the use of elliptic functions. The problem has been the subject of numerous memoirs; we here notice only the form of solution given by Rueb (1834), and at a later period by G. Kirchoff (1878). We write

\[
\omega = \int \frac{d\phi}{\Delta \phi}, \Delta \phi = (1 - \kappa \sin^2 \phi),
\]

we have, in the notation of elliptic functions, $\phi = \arcsin \omega$. If we assume

\[
\phi = \alpha \cos \theta, \quad q = \alpha \sin \theta, \quad r = \rho \Delta \cos \theta + \alpha, \quad t = \kappa \rho \sin \theta.
\]

(7)

Hence (5) will be satisfied, provided

\[
\frac{\partial q}{\partial \alpha} = B - C, \quad \frac{\partial q}{\partial \rho} = C - A, \quad \frac{\partial \alpha}{\partial \rho} = A - B.
\]

(8)

These equations, together with the arbitrary initial values of $\rho, q, r$, determine the six constants which we have denoted by $\alpha, q_0, r_0, \kappa, \rho_0, \alpha_0$. We will suppose that $A > B > C$. From the form of the pole and the umbilic curves referred to in (6) it appears that the angular velocity $\zeta$ about the axis of mean motion must vanish periodically. If we adopt one of these epochs as the origin of $t$, we have $\zeta = \alpha + \rho$, and $\omega_0, \rho_0$ will become identical with the initial values of $\rho, \alpha$. The conditions (9) then lead to

\[
\kappa = B - C, \quad \rho = \frac{(A - B) \alpha}{B C - B^2}, \quad \omega = \frac{(A - B) \alpha}{B C - B^2}
\]

(9)
For a real solution we must have $k^2 < 1$, which is equivalent to 2$T > \pi$. If the initial conditions are such as to make 2$T < \pi$, we must interchange the forms of $p$ and $q$ in (7). In the present case the instantaneous axis returns to its initial position in the body whenever $\phi$ increases by 2$\pi$, i.e., whenever $t$ increases by $4k/\omega$, when $K$ is the "complete" elliptic integral of the first kind with respect to the modulus $k$.

The elliptic functions degenerate into simpler forms when $k^2 = 0$ or $k^2 = 1$. The former case arises when two of the principal moments are equal; this has been sufficiently dealt with in §19. If $k^2 = 1$, we must have 2$T = \pi$. We have seen that the alternative 2$T \leq \pi$ determines whether the pole-hode cone surrounds the principal axis of least or greatest moment. The case of 2$T = \pi$, exactly, is therefore a critical case; it may be shown that the instantaneous axis either coincides permanently with the axis of mean moment or approaches it asymptotically.

When the origin of the moving axes is also in motion with a velocity $\dot{q}$ whose components are $u$, $v$, $w$, the dynamical equations are

$$\frac{dt}{dt} = -r + q = X, \quad \frac{d\eta}{dt} = \frac{dr}{dt} + q = Y, \quad \frac{d\theta}{dt} + q = Z, \quad (11)$$

$$\frac{dx}{dt} - r + q \cdot -w + v = L, \quad \frac{dx}{dt} - r + q \cdot -w + v = L, \quad \frac{d\eta}{dt} + q = \eta = M, \quad (12)$$

To prove these, we may take fixed axes $O_x', O_y', O_z'$ coincident with the moving axes at time $t$, and compare the linear and angular momenta $\xi + \xi', \eta + \eta', \zeta + \zeta', \lambda + \lambda, \mu + \mu, \nu + \nu$ relative to the new position of the axes, $O_x, O_y, O_z$ at time $t + dt$ with the original momenta $\xi, \eta, \zeta, \lambda, \mu, \nu$ relative to $O_x', O_y', O_z'$ at time $t$. As in the case of (2), the equations are applicable to any dynamical system whatever. If the moving origin coincides always with the mass-centre, we have $\xi, \eta, \zeta = M \mu, M \nu, M \zeta$, where $M$ is the total mass, and the equations simplify.

When, in any problem, the values of $u, v, w, p, q, r$ are determined as functions of $t$, it still remains to connect the moving axes with some fixed frame of reference. It will be sufficient to take the case of motion about a fixed point $O$; the angular co-ordinates $\theta, \psi$ of Euler may then be used for the purpose. Referring to fig. 36 we see that the angular velocities $p, q, r$ of the moving lines, $O_x, O_y, O_z$ about their instantaneous positions are

$$p = \dot{\psi} \cos \theta - \sin \theta \cos \phi \dot{\phi}, \quad q = \dot{\theta} \cos \phi + \sin \phi \dot{\psi}, \quad \dot{r} = \dot{\phi} \cos \phi \dot{\psi}.$$  

By § 7 (3), (4). If $O_x, O_y, O_z$ be principal axes of inertia of a solid, and if $A, B$ denote the corresponding moments of inertia, the kinetic energy is given by

$$2T = A(\dot{\theta} \cos \phi + \sin \phi \dot{\psi})^2 + B(\dot{\phi} \cos \phi + \sin \phi \dot{\psi})^2 + C(\dot{\phi} \cos \phi \dot{\psi})^2.$$

If $A = B$ this reduces to

$$2T = A(\dot{\theta} \sin \phi + \dot{\phi} \cos \phi \dot{\psi}) + C(\dot{\phi} \cos \phi \dot{\psi})^2.$$

cf. § 20 (1).

§ 22. Equations of Motion in Generalized Co-ordinates.—Suppose we have a dynamical system composed of a finite number of material particles or rigid bodies, whether free or constrained in any way, which are subject to mutual forces and also to the action of any given external forces. The configuration of such a system can be completely specified by means of a certain number ($n$) of independent quantities, called the generalized co-ordinates of the system. These co-ordinates may be chosen in an endless variety of ways, but their number is determinate, and expresses the number of degrees of freedom of the system. We denote these co-ordinates by $q_1, q_2, \ldots, q_n$. It is implied in the above description of the system that the Cartesian co-ordinates $x, y, z$ of any particle of the system are known functions of the $q'$s, varying in form (of course) from particle to particle. Hence the kinetic energy $T$ is given by

$$2T = \sum m\left([\dot{q}_1]^2 + [\dot{q}_2]^2 + \cdots + [\dot{q}_n]^2\right)$$

$$= a_{11}\dot{q}_1^2 + a_{22}\dot{q}_2^2 + \cdots + a_{nn}\dot{q}_n^2 + \cdots$$

Thus $T$ is expressed as a homogeneous quadratic function of the quantities $\dot{q}_1, \dot{q}_2, \ldots, \dot{q}_n$, which are called the generalized components of velocity. The coefficients $a_{11}, a_{22}, \ldots$ are called the coefficients of inertia; they are not in general constants, being functions of the $q'$s and so variable with the configuration. Again, if $(X, Y, Z)$ be the force on $m$, the work done in an infinitesimal change of configuration is

$$\Sigma (X\dot{q}_1 + Y\dot{q}_2 + Z\dot{q}_3) = \dot{Q}_1 + \dot{Q}_2 + \dot{Q}_3 = +\dot{Q}_n.$$

The quantities $\dot{Q}$ are called the generalized components of force.

The equations of motion of $m$ being

$$m\ddot{x} = X, \quad m\ddot{y} = Y, \quad m\ddot{z} = Z,$$

we have

$$\dot{Q}_1 \dot{Q}_2 = \Sigma \left\{ m\left(\frac{\partial Q_1}{\partial q_1} \frac{\partial Q_2}{\partial q_1} + \frac{\partial Q_2}{\partial q_2} \right) \right\} = \dot{Q}_3.$$

Now

$$\ddot{q}_1 = \frac{\partial \dot{Q}_1}{\partial q_1} + \frac{\partial \dot{Q}_2}{\partial q_2} + \cdots + \frac{\partial \dot{Q}_n}{\partial q_n},$$

whence

$$\frac{\partial \dot{Q}_1}{\partial q_1} = \frac{\partial \dot{Q}_2}{\partial q_2} = \cdots = \frac{\partial \dot{Q}_n}{\partial q_n}.$$

Also

$$\frac{\partial \dot{Q}_1}{\partial q_1} = \frac{\partial \dot{Q}_2}{\partial q_2} = \cdots = \frac{\partial \dot{Q}_n}{\partial q_n}.$$

Hence

$$\dot{Q}_1 = \frac{\partial \dot{Q}_2}{\partial q_2} = \cdots = \frac{\partial \dot{Q}_n}{\partial q_n}.$$

By these and the similar transformations relating to $\dot{y}$ and $\dot{z}$ the equation (6) takes the form

$$\frac{\partial \dot{Q}_1}{\partial q_1} = \frac{\partial \dot{Q}_2}{\partial q_2} = \cdots = \frac{\partial \dot{Q}_n}{\partial q_n}.$$

If we put $r = 1, 2, \ldots, n$ in succession, we get the $n$ independent equations of motion of the system. These equations are due to Lagrange, with whom indeed the first conception, as well as the establishment, of a general dynamical method applicable to all systems whatever appears to have originated. The above proof was given by Sir W. R. Hamilton (1835). Lagrange's own proof will be found under DYNAMICS, § Analytical. In a conservative system free from external forces we have

$$\Sigma (X\dot{q}_1 + Y\dot{q}_2 + Z\dot{q}_3) = -\epsilon V,$$

where $\epsilon$ is the potential energy. Hence

$$\dot{Q}_1 - \frac{\partial V}{\partial q_1}, \dot{Q}_2 = \frac{\partial V}{\partial q_2}, \dot{Q}_3 = \frac{\partial V}{\partial q_3}.$$

If we imagine any given state of motion $(q_1, q_2, \ldots, q_n)$ through the configuration $(q_1, q_2, \ldots, q_n)$ to be generated instantaneously from rest by the action of suitable impulsive forces, we find on integrating (15) with respect to $t$ over the infinitely short duration of the impulse

$$\frac{\partial \dot{Q}_1}{\partial q_1} = \dot{Q}_1,$$

where $Q_1$ is the time integral of $Q_1$ and so represents a generalized component of impulse. By an obvious analogy, the expressions $\frac{\partial \dot{Q}_j}{\partial q_j}$ may be called the generalized components of momentum; they are usually denoted by $p_j$, thus

$$p_j = \frac{\partial \dot{Q}_j}{\partial q_j} = a_{11} q_1 + a_{22} q_2 + \cdots + a_{nn} q_n.$$

Since $T$ is a homogeneous quadratic function of the velocities $q_1, q_2, \ldots, q_n$, we have

$$2T = \dot{q}_1^2 + \dot{q}_2^2 + \cdots + \dot{q}_n^2 = p_1 q_1 + p_2 q_2 + \cdots + p_n q_n.$$

Hence

$$\frac{\partial \dot{Q}_1}{\partial q_1} = \dot{Q}_1 = \partial t \frac{\partial T}{\partial q_1} + \frac{\partial T}{\partial q_1} = \frac{\partial T}{\partial q_1} = \frac{\partial T}{\partial q_1} = \cdots = \frac{\partial T}{\partial q_n} = \cdots.$$
This equation expresses that the kinetic energy is increasing at a rate equal to that at which work is being done by the forces. In the case of a conservative system free from extraneous force it becomes the equation of energy
\[ \frac{d}{dt}(T+V) = 0, \quad \text{or } T+V = \text{const.}, \]  
(20)
in virtue of (13).

As a first application of Lagrange's formula (11) we may form the equations of motion of a particle in spherical polar co-ordinates. Let \( r \) be the distance of a point \( P \) from a fixed origin \( O \), \( \theta \) the angle which \( OP \) makes with a fixed direction \( OZ \), \( \psi \) the azimuth of the plane \( ZOP \) relative to some fixed plane through \( OZ \). The displacements of \( P \) due to small variations of these co-ordinates are \( dr \) along \( OP \), \( r \, d\theta \) perpendicular to \( OP \) in the plane \( ZOP \), and \( r \, d\psi \) parallel to this plane. The component velocities in these directions are therefore \( r \, \dot{r} \), \( r \, \dot{\theta} \), \( \dot{\psi} \), and if \( m \) be the mass of a moving particle we have
\[ 2T = m(r^2 + r^2 + r^2) \sin^2 \theta \phi). \]  
(21)
Hence the formula (11) gives
\[ m(\ddot{r} - r \, \dot{\theta}^2 - r \, \dot{\psi}^2) = R, \]
\[ \frac{d}{dt}(mr^2 \theta) - m \, r^2 \dot{\theta} \sin \theta \, \dot{\psi} \theta = a, \]
\[ \frac{d}{dt}(mr^2 \psi) = \dot{\psi} = \frac{\sin \theta}{a} \sin \theta \phi, \]
(22)
where \( h \) is a constant. The latter equation expresses that the angular momentum \( m^2 \dot{\psi} \sin^2 \psi \) about the vertical \( ZO \) is constant. By elimination of \( \psi \) we obtain
\[ \theta - \dot{\psi} \cos \theta \sin \theta = -\frac{c}{\sin \theta}, \]
\[ \sin^2 \theta \dot{\psi} = h, \]
(23)
where \( \dot{h} \) is the constant of the motion.

If the particle describes a horizontal circle of angular radius \( a \) with constant angular velocity \( \Omega \), we have \( \theta = 0, \dot{h} = \Omega \cdot 0, a \), and therefore
\[ \Omega = \frac{\dot{h}}{a}, \]
(24)
as is otherwise evident from the elementary theory of uniform circular motion. To investigate the small oscillations about this state of steady motion we write \( \theta = a + \chi \) in (24) and neglect terms of the second order in \( \chi \). We find, after some reductions,
\[ \chi \left[ 1 + (1 + 3 \cos^2 a) \right] = 0, \]
(25)
which shows that the variation of \( \chi \) is simple-harmonic, with the period
\[ 2\pi \sqrt{\frac{1}{1+3 \cos^2 a}}. \]
(26)
As regards the most general motion of a spherical pendulum, it is obvious that a particle moving under gravity on a smooth sphere cannot pass through the highest or lowest point unless it describes a vertical circle. In all other cases there must be an upper and a lower limit to the altitude. Again, a vertical plane passing through \( O \) and a point where the motion is horizontal is evidently a plane of symmetry as regards the path. Hence the path will be confined between two horizontal circles which it touches alternately, and the direction of motion is never horizontal except at these circles. In the case of disturbed steady motion, just considered, these circles are nearly coincident. When both are near the lowest point the horizontal projection of the path is approximately an ellipse, as shown in § 113; a closer investigation shows that the ellipse is to be regarded as revolving about its centre with the angular velocity \( \sqrt{2h/\ell} \), where \( \ell \) are the semi-axis.

To apply the equations (11) to the case of the top we start with the expression (15) of § 21 for the kinetic energy, the simplified form (1) of § 20 being for the present purpose inadmissible, since it is essential that the generalized co-ordinates employed should be competent to specify the position of every particle. If \( \lambda, \mu, \nu \) be the components of momentum, we have
\[ \lambda = \frac{dT}{\partial \phi} = \dot{\phi}, \]
\[ \mu = \frac{dT}{\partial \psi} = \lambda \sin \theta \psi + \psi \cos \theta \psi \phi, \]
\[ \nu = \frac{dT}{\partial \phi} = C \phi + \cos \theta \psi. \]
(27)
The meaning of these quantities is easily recognized; thus \( \mu \) is the angular momentum about a horizontal axis normal to the plane of \( \theta, \mu \) is the angular momentum about the vertical \( ZO \), and \( \nu \) is the angular momentum about the axis of symmetry. If \( M \) be the total mass, the potential energy is \( V = Mgh \cos \theta \), if \( OZ \) be drawn vertically upwards. Hence the equations (11) become
\[ A\dot{\phi} - \lambda \sin \theta \psi + \psi \cos \theta \psi = 0, \]
\[ A\dot{\psi} - \mu = a, \]
\[ \mu = c, \]
(28)
of which the last two express the constancy of the momenta \( \mu, \nu \).

Hence
\[ A\dot{\phi} - \lambda \sin \theta \psi + \psi \cos \theta \psi = 0, \]
\[ A\dot{\psi} - \mu = a, \]
\[ \mu = c, \]
(29)
If we eliminate \( \psi \) we obtain the equation (15) of § 20. The theory of disturbed precessional motion there outlined does not give a convenient view of the oscillations of the axis about the vertical position. If \( \theta \) be small the equations (29) may be written
\[ \theta - \dot{\phi}^2 = \frac{\sin^2 \theta}{\sin \theta} \varphi^2 - 2AM \theta \]
(30)
where
\[ \theta = \frac{\varphi^2}{2AM}, \]
(31)
Since \( \theta, \psi \) are the polar co-ordinates (in a horizontal plane) of a point on the axis of symmetry, relative to an initial line which revolves with constant angular velocity \( \varphi^2/2AM \), we see by comparison with § 14 (15) (16) that the motion of such a point will be elliptic-harmonic superposed on a uniform rotation \( \varphi^2/2AM \), provided \( \varphi^2 > 2AM \). This gives (in essentials) the theory of the "gyroscopic pendulum."}

§ 23. Stability of Equilibrium. Theory of Vibrations.—If, in a conservative system, the configuration \( (\varphi_0, \varphi_1, \ldots, \varphi_n) \) be one of equilibrium, the equations (14) of § 22 must be satisfied by \( \varphi_1, \varphi_2, \ldots, \varphi_n = 0 \), whence
\[ \partial V / \partial \varphi = 0. \]
(1)
A necessary and sufficient condition of equilibrium is therefore that the value of the potential energy should be stationary for infinitesimal variations of the co-ordinates. If, further, \( V \) be a minimum, the equilibrium is necessarily stable, as was shown by P. G. L. Dirichlet (1846). In the motion consequent on any slight disturbance the total energy \( T + V \) is constant, and since \( T \) is essentially positive it follows that \( V \) can never exceed its equilibrium value by more than a slight amount, depending on the energy of the disturbance. This implies, on the present hypothesis, that there is an upper limit to the deviation of each co-ordinate from its equilibrium value; moreover, this limit diminishes indefinitely with the energy of the original disturbance. No such simple proof is available to show without qualification that the above condition is necessary. If, however, we recognize the existence of dissipative forces called into play by any motion whatever of the system, the conclusion can be drawn as follows. However slight these forces may be, the total energy \( T + V \) must continually diminish so long as the velocities \( \dot{\varphi}_1, \dot{\varphi}_2, \ldots, \dot{\varphi}_n \) differ from zero. Hence if the system be started from rest in a configuration for which \( V \) is less than in the equilibrium configuration considered, this quantity must still further decrease (since \( T \) cannot be negative), and it is evident that either the system will finally come to rest in some other equilibrium configuration, or \( V \) will in the long run diminish indefinitely. This argument is due to Lord Kelvin and P. G. Tait (1879).

In discussing the small oscillations of a system about a configuration of stable equilibrium it is convenient so to choose the generalized co-ordinates \( \varphi_1, \varphi_2, \ldots, \varphi_n \) that they shall vanish in the configuration in question. The potential energy is then given with sufficient approximation by an expression of the form
\[ 2V = \sum \ell \sin^2 \alpha \phi + \ldots + 2c \sin \alpha \dot{\phi}, \]
(2)
a constant term being irrelevant, and the terms of the first order being absent since the equilibrium value of \( V \) is stationary. The coefficients \( c, \alpha \) are called coefficients of stability. We may further treat the coefficients of inertia \( \alpha_{\varphi_1}, \alpha_{\varphi_n} \) of § 22 (1) as constants. The Lagrangian equations of motion are then of the type
\[ \alpha_{\varphi_1} \sin \varphi_2 + \alpha_{\varphi_2} \sin \varphi_3 + \ldots + \alpha_{\varphi_n} \sin \varphi_{n+1} = \alpha_{\varphi_1} \sin \varphi_2 + \ldots + \alpha_{\varphi_n} \sin \varphi_{n+1} + \ldots + c \sin \varphi_n = \varphi_n, \]
where \( \varphi_n \) now stands for a component of extraneous force. In a "free oscillation" we have \( \varphi_1, \varphi_2, \ldots, \varphi_n = 0 \), and if we assume
\[ \alpha_{\varphi_1} = \alpha_{\varphi_2} = \alpha_{\varphi_3} = \ldots = \alpha_{\varphi_n} = 0, \]
(4)
we obtain \( n \) equations of the type
\[ \left( \alpha - \alpha_{\varphi_n} \right) A_1 + \left( \alpha - \alpha_{\varphi_n} \right) A_2 + \ldots + \left( \alpha - \alpha_{\varphi_n} \right) A_n = 0, \]
(5)
Eliminating the $n-1$ ratios $A_1:A_2:\ldots:A_n$ we obtain the determinantal equation

$$\Delta(\sigma^2)=0,$$

where

$$\Delta(\sigma^2)=\begin{vmatrix} -\sigma^2C_{01} & -\sigma^2 C_{11} & \cdots & -\sigma^2 C_{n1} \\ -\sigma^2 C_{02} & -\sigma^2 C_{12} & \cdots & -\sigma^2 C_{n2} \\ \vdots & \vdots & \ddots & \vdots \\ -\sigma^2 C_{0n} & -\sigma^2 C_{1n} & \cdots & -\sigma^2 C_{nn} \end{vmatrix} = 0$$

The quadratic expression for $T$ is essentially positive, and the same holds with regard to $V$ in virtue of the assumed stability. It may be shown algebraically that under these conditions the $n$ roots of the above equation in $\sigma^2$ are all real and positive. For any particular root, the equations (5) determine the ratios of the quantities $A_1, A_2, \ldots, A_n$, the absolute values being alone arbitrary; these quantities are in fact proportional to the minors of any one row in the determinate $\Delta(\sigma^2)$. By combining the solutions corresponding to a pair of equal and opposite values of $\sigma$ we obtain a solution in real form:

$$q_r = a_r \cos(\sigma t + \epsilon),$$

where $a_1, a_2, \ldots, a_n$ are a determine series of quantities having to one another the above-mentioned ratios, whilst the constants $C, \epsilon$ are arbitrary. This solution, taken by itself, represents a motion in which each particle of the system (since its displacements parallel to Cartesian co-ordinate axes are linear functions of the $q_r$'s) executes a simple vibration of period $2\pi/\sigma$. The amplitudes of oscillation of the various particles have definite ratios to one another, and the phases are in agreement, the absolute amplitude (depending on $C$) and the phase-constant ($\epsilon$) being alone arbitrary. A vibration of this character is called a normal mode of vibration of the system; the number $n$ of such modes is equal to that of the degrees of freedom possessed by the system. These statements require some modification when two or more of the roots of the equation (5) are equal. In the case of a multiple root the minors of $\Delta(\sigma^2)$ all vanish, and the basis for the determination of the quantities $a_r$ disappears. Two or more normal modes then become to some extent indeterminate, and elliptic vibrations of the individual particles are possible. An example is furnished by the spherical pendulum ($\S$ 13).

As an example of the method of determination of the normal modes we may take the "double pendulum." A mass $M$ hangs from a fixed point by a string of length $a$, and a second mass $m$ hangs from $M$ by a string of length $b$. For simplicity we will suppose that the motion is confined to one vertical plane. If $\theta, \phi$ be the inclinations of the two strings to the vertical, we have, approximately,

$$\begin{align*}
x T &= M \alpha^2 \phi + m (a \phi + b \beta)^2, \\
x V &= M \alpha^2 \phi + m (a \phi + b \beta)^2.
\end{align*}$$

The equations (3) take the forms

$$\begin{align*}
2a^2 \beta \phi + m (a \phi + b \beta)^2 &= 0, \\
2b^2 \beta \phi + m (a \phi + b \beta)^2 &= 0.
\end{align*}$$

where $\mu = m(M + m)$. Hence

$$\begin{align*}
2a^2 \beta \phi + m (a \phi + b \beta)^2 &= 0, \\
2b^2 \beta \phi + m (a \phi + b \beta)^2 &= 0.
\end{align*}$$

The frequency equation is therefore

$$\begin{align*}
2a^2 (\sigma^2 - \alpha^2) + m (a \phi + b \beta)^2 &= 0, \\
2b^2 (\sigma^2 - \beta^2) + m (a \phi + b \beta)^2 &= 0.
\end{align*}$$

The roots of this quadratic in $\sigma^2$ are easily seen to be real and positive. If $M$ be large compared with $m, \mu$ is small, and the roots are $\alpha^2$ and $\beta^2$, approximately. In the normal mode corresponding to the former root $M$ swings almost like the bob of a simple pendulum of length $a$, being comparatively uninfluenced by the presence of $m$, whilst $m$ executes a "forced" vibration ($\S$ 12) of the corresponding period. In the second mode, $M$ is nearly at rest (as appears from the second of equations (11)), whilst $m$ (3) almost like the bob of a simple pendulum of length $b$. Whatever the ratio $M/m$, the two values of $\sigma^2$ can never be exactly equal, but they are approximately equal if $a, b$ are nearly equal and $\mu$ is very small. A curious phenomenon is then to be observed; the motion of each particle, being made up (in general) of two superimposed simple vibrations of equal period, is seen to fluctuate greatly in extent, and if the amplitudes be equal we have periods of approximate rest, as in the case of "beats" in acoustics. The vibration then appears to be transferred alternately from $m$ to $M$ at regular intervals. If, on the other hand, $M$ is small compared with $m, \mu$ is nearly equal to unity, and the roots of (12) are $\sigma^2 = \alpha^2 (a + b)$ and $\sigma^2 = m g / (M (a + b) / a b), approximately.
The case of three degrees of freedom is instructive on account of the geometrical analogies. With a view to these we may write
\[ 2T = \alpha^2 x^2 + \beta^2 y^2 + \gamma^2 z^2 \]
\[ 2V = \alpha^2 x^2 + \beta^2 y^2 + \gamma^2 z^2 - 2\mu x y + 2\nu x z \]

It is obvious that the ratio
\[ \frac{V(x,y,z)}{T(x,y,z)} \]

must have a least value, which is moreover positive, since the numerator and denominator are both essentially positive. Denoting this value by \( \sigma^2 \), we have
\[ \alpha x + \beta y + \gamma z = \sigma (x, y, z + \delta + \varepsilon), \]
\[ \alpha x + \beta y + \gamma z = \sigma (x, y, z + \delta + \varepsilon), \]
\[ \alpha x + \beta y + \gamma z = \sigma (x, y, z + \delta + \varepsilon), \]
provided \( x, y, z \) are the corresponding values of the ratios \( x : y : z \). Again, the expression (22) will also have a least value when the ratios \( x : y : z \) are subject to the condition
\[ \frac{\partial V}{\partial x} = \frac{\partial V}{\partial y} = \frac{\partial V}{\partial z} = 0, \]
and if this be denoted by \( \sigma^2 \), we have a second system of equations similar to (23). The remaining value \( \sigma^2 \) is the value of (22) when \( x : y : z \) are chosen so as to satisfy (24) and
\[ \alpha x + \beta y + \gamma z = \sigma (x, y, z + \delta + \varepsilon), \]
\[ \alpha x + \beta y + \gamma z = \sigma (x, y, z + \delta + \varepsilon), \]
\[ \alpha x + \beta y + \gamma z = \sigma (x, y, z + \delta + \varepsilon), \]
the problem is identical with that of finding the common conjugate diameters of the ellipsoids \( T(x, y, z) = \text{const}, V(x, y, z) = \text{const} \). If in (21) we imagine that \( x, y, z \) denote infinitesimal rotations of a solid free to turn about a fixed point in a given field of force, it appears that the three normal modes consist each of a rotation about one of the three diameters aforesaid, and that the values of \( \sigma \) are proportional to the ratios of the lengths of corresponding diameters of the two quadrics.

We proceed to the forced vibrations of the system. The typical case is where the extraneous forces are of the simple-harmonic type \( \cos(\sigma t) \); the most general law of variation with time can be derived from this by superposition, in virtue of Fourier’s theorem. Analytically, it is convenient to put \( Q = e^{\sigma t} \), so that in the equations the factor \( e^{\sigma t} \) will run through them all, and need not always be included. For a system of one degree of freedom we have
\[ \ddot{q} + \sigma^2 q = 0, \]
and therefore on the present supposition as to the nature of \( Q \)
\[ q = \frac{Q}{C} - e^{-\sigma t} \]

This solution has been discussed to some extent in \( \S 12 \), in connection with the forced oscillations of a pendulum. We may note further that when \( \sigma \) is small the displacement has the “equilibrium value” \( Q/C \), the same as would be produced by a steady force equal to the instantaneous value of the actual force, the inertia of the system being inoperative. On the other hand, when \( \sigma^2 \) is great \( q \) tends to the value \( -Q/\sigma^2 \), the same as if the potential energy were ignored. When there are \( n \) degrees of freedom we have from (3)
\[ (\sigma_1^2 - \sigma^2)a_1 + (\sigma_2^2 - \sigma^2)a_2 + \ldots + (\sigma_n^2 - \sigma^2)a_n = Q, \]
and therefore
\[ \Delta (\sigma^2) q_r = \sigma_r Q, \]
\[ \sigma_r Q, \]
\[ \sigma_r Q, \]
where \( \sigma_r, \sigma_2, \ldots, \sigma_n \) are the minors of the \( r \)th row of the determinant \( \Delta \). Every particle of the system executes in general a simple vibration of the imposed period \( 2\pi/\sigma \), and all the particles pass simultaneously through their equilibrium positions. The amplitude becomes very great when \( \sigma \) approximates to a root of (6), i.e. when the imposed period nearly coincides with one of the free periods. Since the \( \sigma_r \) are \( \sigma_1, \sigma_2, \ldots, \sigma_n \), the coefficient of \( Q \) in the expression for \( q_r \) is identical with that of \( Q \), in the expression for \( q_r \). Various important “reciprocal theorems” formulated by H. Helmholtz and Lord Rayleigh are founded on this relation. Free vibrations must of course be superposed on the forced vibrations given by (20) in order to obtain the complete solution of the dynamical equations.

In practice the vibrations of a system are more or less affected by dissipative forces. In order to obtain at all events a qualitative representation of these it is usual to introduce into the equations frictional terms proportional to the velocities. Thus in the case of one degree of freedom we have, in place of (26),
\[ a q + b q + c q = 0, \]
where \( a, b, c \) are positive. The solution of this has been sufficiently discussed in \( \S 12 \). In the case of multiple freedom, the equations of small motion when modified by the introduction of terms proportional to the velocities are of the type
\[ \ddot{q} + \sigma^2 q = 0, \]

The terms due to \( F \) in (30) are such as would arise from frictional resistances proportional to the absolute velocities of the particles, or to mutual forces of resistance proportional to the relative velocities; they are therefore classed as frictional or dissipative forces. The terms affected with the coefficients \( \beta_r \), on the other hand are such as occur in “cyclic” systems with latent motion (DYNAMICS, \( \S \) Analytical); they are called the gyrostatic terms. If we multiply (30) by \( q_r \), and sum with respect to \( r \) from 1 to \( n \), we obtain, in virtue of the relations \( \beta_r = -\beta_r, \beta_r = 0, \)

\[ \frac{\partial}{\partial t} T + V = 2F + Q_{11} + Q_{12} + \ldots + Q_{nn} = 0, \]

This shows that mechanical energy is lost at the rate \( 2F \) per unit time. The function \( F \) is therefore called by Lord Rayleigh the dissipation function.

If we omit the gyrostatic terms, and write \( q_r = C e^{\sigma t} \), we find, for a free vibration,
\[ (\alpha_1^2 + \beta_1^2 + \gamma_1^2) \alpha_1 \ldots (\alpha_n^2 + \beta_n^2 + \gamma_n^2) \alpha_n = 0, \]

This leads to a determinantal equation in \( \lambda \) whose \( 2n \) roots are either real and negative, or complex with negative real parts, on the present hypothesis that the functions \( T, V, F \) are all essentially positive. If we combine the solutions corresponding to a pair of conjugate complex roots, we obtain, in real form,
\[ q_r = C e^{-\sigma t} \cos(\sigma t + \epsilon), \]

where \( r, t, \sigma, \epsilon \) are determined by the constitution of the system, whilst \( C, \epsilon \) are arbitrary, and independent of \( r \). The \( n \) formulae of this type represent a normal mode of free vibration; the individual particles rotate as a rule in elliptic orbits which gradually contract according to the law indicated by the exponential factor. If the friction be relatively small, all the normal modes are of this character, and unless two or more values of \( \sigma \) are nearly equal the elliptic orbits are very elongated. The effect of friction on the period is moreover of the second order.

In a forced vibration of \( e^{\sigma t} \), the variation of each co-ordinate is simple-harmonic, with the prescribed period, but there is a retardation of phase as compared with the force. If the friction be small the amplitude becomes relatively very great if the imposed period approximate to a free period. The validity of the “reciprocal theorems” of Helmholtz and Lord Rayleigh, already referred to, is not affected by frictional forces of the kind here considered.
by a transcendental equation corresponding to the determinant equation (6).

Numerous examples of this procedure, and of the corresponding treatment of forced oscillations, present themselves in theoretical acoustics. It must suffice here to consider the small oscillations of a mass hanging from a fixed extremity. If $x$ be measured upwards from the horizontal, the component of the tension $P$ at any point will be \( P \delta y / \delta x \), approximately, if $y$ denote the lateral displacement, forming the equation of motion of a mass element, $\rho \delta x$, we have

\[
\rho \ddot{x} - g = \frac{P}{\rho \delta x} \frac{\delta y}{\delta x}. \tag{38}
\]

Neglecting the vertical acceleration we have $P = g \delta x$, whence

\[
\frac{\ddot{x}}{x} = \frac{g}{\rho \delta x} \frac{\delta y}{\delta x}. \tag{39}
\]

Assuming that $y$ varies as $e^{\alpha t}$ we have

\[
\frac{\ddot{x}}{x} = \frac{g}{\rho \delta x} \frac{\delta y}{\delta x} e^{\alpha t}. \tag{40}
\]

provided $\alpha = \sqrt{\rho / \rho \delta x} \cdot \delta y / \delta x$. The solution of (40) which is finite for $\alpha = 0$ is readily obtained in the form of a series, thus

\[
y = C (1 - \frac{\alpha}{k^2} x^2 + \frac{\alpha^2}{k^4} x^4 - \cdots - \frac{\alpha^n}{k^n} x^n - \cdots), \tag{41}
\]

approximately, where the numbers tend to the form $\frac{\alpha}{k^2}$.

The frequency of the gravoist is that of a uniform bar in the ratio $g / \rho \delta x$. That this ratio should be less than unity agrees with the theory of "constrained" or "theoretical" values given in the higher normal modes of the isolated trees. Thus in the second mode there is a node at a distance $100 \ell$ from the lower end.

AUTHORSHIPS.—For indications as to the earlier history of the subject we refer to W. R. Ball, Short Account of the History of Mathematics; M. Cantor, Geschichte der Mathematik (Leipzig, 1880-1892, 1893-1908); C. J. J. Holtz, Mathematische Partielle Differentialgleichungen (Leipzig, 1880-1892); L. E. J. Whittaker, Analytical Dynamics (2nd ed., Cambridge, 1898); W. B. M. Stacey, Theorie des elastischen Systems (Darmstadt, 1892); A. E. H. Love, Theoretical Mechanics (2nd ed., Cambridge, 1904); P. G. Tait, Dynamics of Particles, 3rd ed. (London, 1898); C. J. J. Holtz, Lehrbuch der Statik (Leipzig, 1897), and Mechanik des Himmels; L. Poinsot, Éléments de statique (Paris, 1804), and Théorie nouvelle de la rotation des corps (Paris, 1834).

The literature of graphical statics and its technical applications is very extensive. We may mention K. Culmann, Graphische Statik (2nd ed., Berlin, 1805); F. J. Pflüger, Technische Mechanik; vol. ii. (Leipzig, 1875); L. Henneberg, Statik der starren Systeme (Darmstadt, 1886); M. Lévy, La statique graphique (2nd ed., Paris, 1886-1888); H. Müller-Breslau, Graphische Statik (3rd ed., Berlin, 1901). Sir R. S. Ball's highly original investigations in kinematics and dynamics were collected in the form of the present volume, the original of which it is hoped will be published under the title of Theory of Screws (Cambridge, 1900).

Detailed accounts of the developments of the various branches of the subject from the beginning of the 19th century to the present time, with full bibliographical references, are given in the fourth volume (edited by Professor F. Klein) of the Encyclopädie der mathematischen Wissenschaften (Leipzig). There is a French translation of this work. (See also DYNAMICS. (H. L.)

II.—APPLIED MECHANICS

§ 1. The practical application of mechanics may be divided into two classes, according as the assemblages of material objects to which they relate are intended to remain fixed or to move relatively to each other—the former class being comprehended under the term "Theory of Structures," and the latter under the term "Theory of Machines."

PART I.—OUTLINE OF THE THEORY OF STRUCTURES

§ 2. Support of Structures.—Every structure, as a whole, is maintained in equilibrium by the joint action of its own weight, of the weight of the loads to which it is subjected, and of the resistance of the material which supports it. A structure is supported either by resting on the solid crust of the earth, as buildings do, or by floating in a fluid, as ships do in water and balloons in air. The principles of the support of structures form an important part of Hydromechanics (q.v.). The principles of the support, as a whole, of a structure resting on the land, are so far identical with those which regulate the equilibrium and stability of the several parts of that structure that the theory which seems to require special mention here is one which comprises in one statement the power both of liquids and of loose earth to support structures. This was first demonstrated in a paper by T. Roux, "On the Stability of the Earth," read to the Royal Society in the 19th of June 1856 (Phil. Trans. 1856), as follows:

Let E represent the weight of the portion of a horizontal stratum of earth which is displaced by the formation of a structure. S the utmost weight of that structure consistently with the power of the earth to resist displacement. $\varphi$ the angle of repose of the earth; then

\[
\frac{S}{E} = \tan \theta.
\]

To apply this to liquids $\varphi$ must be made zero, and then $S/E = 1$, as is well known. For a proof of this expression see Rankine's Applied Mechanics, 17th ed., p. 219.

§ 3. Theory of Compression and Connection of Its Pieces.—A structure is composed of pieces,—such as the stones of a building in masonry, the beams of a timber framework, the bars, plates, and bolts of an iron bridge. Those pieces are connected at their points of support, or at their joints, or at both. If we apply to a joint (as dovetails, mortises, tenons) or by separate fastening pieces (as tenons, pins, spikes, nails, holdfasts, screws, bolts, rivets, hoops, straps and sockets).

§ 4. Stability and Strength.—A structure may be damaged or destroyed in three ways: first, by displacement of its parts from their proper positions relatively to each other or to the earth; secondly, by disfigurement of one or more of those pieces, owing to their being unable to preserve their proper shapes under the pressures to which they are subjected; thirdly, by breaking of one or more of those pieces. The power of resisting displacement constitutes stability, the power of each piece to resist disfigurement is its stiffness; and its power to resist breaking, its strength.

§ 5. Conditions of Stability.—The principles of the stability of a structure can be to a certain extent investigated independently of the stiffness and strength, by assuming, in the first instance, that the structure is subjected to some fixed set of conditions, which induce it to assume a certain form, and which can then be taken as the basis for determining the stiffesses and strengths required to prevent its being disfigured to an extent inconsistent with the purposes of the structure, by the greatest forces which are to be applied to it. The condition that each piece of the structure, and each of the resisting forces, shall be capable of yielding, must be answered by the condition that the external pressures applied to it, balanced by the resistances or pressures exerted between it and the contiguous pieces, furnishes the means of determining the magnitudes of the resistances and the resistances required to each joint in order to produce equilibrium; and the conditions of stability are: first, that the position and, secondly, that the direction, of the resistance required at each joint shall, under all the variations to which the structure may be subject, be such as to satisfy the equations of the action of the forces and of the moment of the movement, and of the conditions which are fulfilled by suitably adjusting the figures and positions of the joints, and the ratios of the gross loads of the pieces. As for the magnitude of the resistance, it is limited by conditions, not stability, but strength and stiffness, it is limited by the stiffness and strength of the materials of which they are composed, and by the principles of Engineering and Architecture, it is that which will actually be exerted—but are distinguished by an asterisk. Also, two short chapters which concluded the original article have been omitted—ch. iii., "Applied Energetics, and Theory of Prime Movers," because its subject matter is now treated in various special articles, e.g., "Hydraulics, Steam Engines, Gas Engine, Oil Engine, and fully developed in Rankine's The Steam Engine and Other Prime Movers (London, 1902). (Ed. E.B.)
because the resistances to displacement are the effect of a strained state of the pieces, which strained state is the effect of the load, and when the load is applied the strained state and the resistances produced by it increase until the resistances acquire just those magnitudes in which they are sufficient to balance the load, after which they increase no further.

This principle of least resistance renders determinate many problems in the statics of structures which were formerly considered indeterminate.

§ 7. Relations between Polygons of Loads and of Resistances.—In a structure where each piece is supported at two joints only, the well-known laws of statics state that the directions of the gross load on each piece and of the two resistances by which it is supported must lie in one plane, though the loads may be inclined to each other, and must bear to each other, if not parallel, the same proportion as the distances between the centres of load of any continuous series of pieces. This may be called a partial polygon of resistances. In considering its properties, the load at each centre of load is to be held to include the resistances of those joints which are not comprehended in the diagram. The resistances of the second piece, and so on, are the resultant of the resistance of all the forces acting between the joints and the resistances of all the others, and at each joint. The principle of the least resistance, the whole of the relations amongst the loads and resistances may be found.

§ 8. How the Earth's Resistance is to be treated. When the pressure exerted by a structure on the earth (to which the earth's resistance is equal and opposite) consists either of one pressure, which is necessarily the resultant of the weight of the structure and of all the other forces acting on it, or of two or more parallel vertical forces, whose amount can be determined by the method of superimposed forces, the resistance of the earth can be treated as one or more upward loads applied to the structure. But in other cases the earth is to be treated as one of the pieces of the structure, loaded with a force equal and parallel to the resultant of the weight of the structure and of the other pressures applied to it.

§ 9. Partial Polygons of Resistance.—In a structure in which there are pieces supported at more than two joints, a polygon be constructed of lines containing the centres of load of any continuous series of pieces. This may be called a partial polygon of resistances.

Further, in the first place, the case in which the load and the two resistances by which each piece is balanced meet in one point, which may be called the centre of load of the piece in question. The intersection of the three sides of a triangle; and they must be in the same plane, although the sides of the polygon of resistances may be in different planes.

According to a well-known principle of statics, because the loads or external pressures \( P_1, P_2, P_3 \), &c., balance each other, they must be proportional to the sides of a closed polygon drawn respectively parallel to their directions. In fig. 87, construct such a polygon by drawing the lines \( L_1, L_2, L_3, \) &c., parallel and proportional to, and joined end to end in the order of the gross loads on the structure. Then from the proportionality and parallelism of the loads and the resistances to each piece of the structure to the three sides of a triangle, there results the following theorem (originally due to Rankine):

As from the angles of the polygon of loads there be drawn lines (\( R_1, R_2, R_3, \) &c.), each of which is parallel to the resistance (as \( P_1, P_2, P_3, \) &c.) exerted at the joint between the pieces to which the two resistances are represented by the contiguous sides of the triangle, the resultant of the resistances at each joint is the point of intersection of the lines drawn respectively parallel to the resistances to the point of intersection of the lines drawn respectively parallel to the loads.

When the load on one of the pieces is parallel to the resistances which balance it, the polygon of resistances ceases to be closed, two of the sides becoming parallel to each other and to the load in question, and extending indefinitely. In the polygon of loads (such as \( L_1, L_2, L_3, \) &c.) are applied; then will all those lines meet in one point (O), and their length, measured from that point to the angles of the polygon, will represent the magnitudes of the resistances to the loads exerted on the joint at which the polygon of loads is drawn.

In the case of the pressures, the pressure is the weight of the block or slab acting through its centre of gravity, and therefore no other external force which may be acting on the block, and produce its line of action to cut the joint \( b \) in \( C_1 \), \( C_2 \) and \( C_3 \) will be the centre of pressure for the joint \( b \) and \( R \) is the total force acting there. Repeating this process for each block in succession there will be found the centres of pressure \( C_1, C_2, C_3, \) &c., and also the resultant pressures \( R_1, R_2, R_3, \) &c., at these respective centres. The centres of pressure at the joints are also called centres of resistance, and the curve passing through these points is called a line of resistance. Let all the resultants acting at the several points be treated as one in a series of points so as to form an unclosed polygon. This polygon is the partial polygon of resistance. A curve tangential to all the sides of the polygon is the line of pressures.

§ 11. Stresses and Strains of Friction.—The resistances at the several joints having been determined by the principles set forth in §§ 6, 7, 8, 9 and 10, not only under the ordinary load of the structure, but under all the variations to which the load is subject as to amount and distribution, the joints are now to be placed and operated in practice. The joints shall not suffer relative displacement under any of those loads. The relative displacement of the two pieces which abut against each other at a joint may take place either horizontally, or vertically, or both, and the stress shall be so distributed as to cause the strain to be proportional to the stress. Then let the relation between stress and strain be expressed by the following equation:

\[ \sigma = E \varepsilon \]

where \( \sigma \) is the stress, \( \varepsilon \) is the strain, and \( E \) is the modulus of elasticity.

The stress in the structure may be divided into two parts: (1) a normal stress which is parallel to the plane of the members and is due to the normal load, and (2) a tangential or frictional stress which is at right angles to the plane of the members and is due to the frictional resistance of the earth against the movement. The former is called the direct stress, and the latter the shearing stress.
MECHANICS [THEORY OF STRUCTURES]

by turning or by sliding. Safety against displacement by turning is called stability of position; safety against displacement by sliding, stability of friction.

§ 13. Condition of Stability of Position.—If the materials of a structure were infinitely stiff and strong, the stability of position at any joint would be insured simply by making the centre of resistance fall within the joint under all possible variations of load. In order to allow for the finite stiffness and strength of materials, the least distance of the centre of resistance inward from the nearest edge of the joint is made to bear a definite proportion to the depth of the joint measured in the same direction, which proportion is fixed, sometimes empirically, sometimes by theoretical deduction from the laws of the strength of materials. That least distance is called byolley the moduli of stability, the ratio of the least distance of the centres of resistance of a joint to the depth of the joint, measured in the direction of the principal stress, is called the coefficient of stability. It is not to be confused with the coefficient of friction or the coefficient of resistance, which is the quotient of the resistance of a joint to sliding over the unit area of contact. The coefficient of stability may be increased by giving the joint a lip, by putting in a crown or parapet, or by blowing air bladders into the seam at the top of the joint. To determine whether a masonry joint is stable at a given point, it is necessary to take account of the planes in all possible positions, and determine which position gives the greatest obliquity to the total pressure exerted between the portions of the mass which abut against each other at the plane. The condition of stability is that this obliquity shall not exceed the angle of repose of the earth. The consequences of this principle are treated of in a paper, "On the Stability of Loose Earth," already cited in § 2.

§ 16. Parallel Projections of Figures.—If any figure be referred to a system of co-ordinates, rectangular or oblique, and if a second figure be constructed by means of a second system of co-ordinates, rectangular or oblique, and differing from the first one in rectangularity or obliquity, but so related to the co-ordinates of the first figure that for each point in the first figure there shall be a corresponding point in the second figure, the lengths of corresponding co-ordinates of the second figure in the two co-ordinates are the same as the corresponding co-ordinates of the first one. For such figures there are called parallel projections of one into the other. The properties of parallel projections of most importance to the subject of the present article are the following:

(1) A parallel projection of a straight line is a straight line.
(2) A parallel projection of a plane is a plane.
(3) A parallel projection of a straight line or a plane surface divided in a given ratio is a straight line or a plane surface divided in the same ratio.
(4) A parallel projection of a pair of equal and parallel straight lines, or plain surfaces, is a pair of equal and parallel straight lines, or plain surfaces, with the same relative position.
(5) That a parallel projection of a parallelogram is a parallelogram, and—or that a parallelogram is a parallelogram.
(6) That a parallel projection of a parallelepiped is a parallelepiped.
(7) A parallel projection of a pair of solids having a given ratio is a pair of solids having the same ratio.

Though not essential for the purposes of the present article, the following theorem will serve to illustrate the principle of parallel projections:

(8) A parallel projection of a curve, or of a surface of a given algebraical order, is a curve or a surface of the same order.

For example, all ellipsoids refer to a given parallelogram parallel to any three conjugate diameters are parallel projections of each other and of a sphere referred to rectangular co-ordinates.

§ 17. Parallel Projections of Systems of Forces.—A balanced system of forces may be represented by a system of lines, then will every parallel projection of that system of lines represent a balanced system of forces.

For the condition of equilibrium of forces not parallel is that these shall be represented in direction and magnitude by the sides and diagonals of certain parallelograms, and of parallel forces that they shall divide certain straight lines in certain ratios; and the parallel projection of a parallelogram is a parallelogram, and that an straight line divided in a given ratio is a straight line divided in the same ratio.

The resultant of a parallel projection of any system of forces is the projection of their resultant; and the centre of gravity of a parallel projection of a solid is the projection of the centre of gravity of that solid.

§ 18. Principle of the Transformation of Structures.—Here we have the following theorem: If a structure of a given figure have stability of position under a system of forces represented by a given system of projections, then it will be in the same state if the figures are represented by a system of forces and of parallel forces represented by the corresponding projection of the first system of lines.

In the second structure the weights, external pressures, and resistances will balance each other as in the first structure; the weights of the pieces and all other parallel systems of forces will have the same ratios as in the first structure; and the several centres of resistance and the plane positions of the joints in the same proportions as in the first structure.

If the first structure have stability of friction, the second structure will have stability of friction also, so long as the effect of the transformation is not to increase the obliquity of the resistance at any point beyond the angle of repose.

The lines representing the forces in the second figure show their relative directions and magnitudes. To find their absolute directions and magnitudes, a vertical line is to be drawn in the first figure, as to the angles at the positions of the points of application of the forces. Then will the projection of that line in the projected figure indicate the vertical direction, and represent the weight of the part of the second structure corresponding to the before-mentioned portion of the first.

The foregoing "principle of the transformation of structures" was first announced, though in a somewhat less comprehensive form, to the Royal Society on the 6th of March 1856. It is useful in connexion with the conditions of equilibrium and stability of structures of complex and unsymmetrical figures from those of structures of simple and symmetrical figures. By its aid, for example, the whole of the properties of
elliptical arches, whether square or skew, whether level or sloping in their span, are at once deduced by projection from those of symmetrical circular arches, and the properties of elliptical and ellipticoidal arches and the properties of hemispherical and circular-arched domes. The arches in the form of an arch of earth, which is less horizontally than vertically in a certain given ratio, can be deduced by a projection from those of arches fitted to resist the thrust of a liquid, which is of equal intensity, horizontally and vertically.

§ 19. Conditions of Stiffness and Strength.—After the arrangement of the pieces of a structure and the size and figure of their joints or surfaces of contact have been determined so as to fulfil the conditions of stiffness and strength, the next step is the determination of the resultant or total load on each piece, and the absolute magnitude of the loads on the different pieces—the dimensions of each piece singly have to be adjusted so as to fulfil the conditions of stiffness and strength; and it is then necessary to determine whether or not the stresses will exceed the absolute magnitude of the load on each piece, and of the resistances by which it is balanced, but also on the mode of distribution of the load over the piece, and of the resistances over the joints.

The effect of the pressures applied to a piece, consisting of the load and the supporting resistances, is to force the piece into a state of strain or disfigurement, which increases until the elasticity, resistance to strain, of the material causes it to exert a stress, or effort to recover its figure, equal and opposite to the system of applied pressures. The condition of stiffness is that the strain or disfigurement shall not be greater than is consistent with the purposes of the structure; and the condition of strength is that the stress shall not exceed that which will immediately cause a fracture or safety against breaking. The ratio in which the utmost stress before breaking exceeds the safe working stress is called the factor of safety, and is determined empirically. It varies from three to twelve for various materials and structures. (See STRENGTH OF MATERIALS.)

PART II. THEORY OF MACHINES

§ 20. Parts of a Machine: Frame and Mechanism.—The parts of a machine may be divided into two principal divisions,—the frame, or fixed parts, and the mechanism, or moving parts. The frame is the framework which supports the pieces of the mechanism, and to a certain extent determines the nature of their motions. The form and arrangement of the pieces of the frame depend upon the arrangement and the motions of the mechanism; the dimensions of the frame are those which give it the required safety and stiffness; the stiffness and strength are determined from the pressures applied to it by means of the mechanism. It appears therefore that in general the mechanism is to be designed first and the frame afterwards, and that the designing of the frame regulates the dimensions of the frame of the mechanism; and the dimensions of the frame, and of the strength and stiffness of materials, are taken as being adapted to the frame, and the frame to the most severe load which can be thrown upon it at any period of the action of the mechanism.

Excess of weight is independent of the stiffness and dimensions of the frame; and its dimensions are to be adapted, according to the principles of the strength and stiffness of materials, to the most severe load to which it can be subjected during the action of the machine.

§ 21. Definition and Division of Machines.—From what has been said in the last section it appears that the art of designing machines has reference to the stability of the frame and to the stiffness and strength of the frame and mechanism is a branch of the art of designing single machines. It is therefore, to be considered from the theory of machines, properly speaking, which has reference to the action of machines considered as moving. In the application of a machine the following three things take place:—

Firstly, Some natural source of energy communicates motion to force to a pair of pieces of the mechanism, called the receiver of power or prime mover. Secondly, The motion and force are transmitted from the prime mover through the train of mechanism to the working pieces or parts, and the force and motion are modified in amount and direction, so as to be rendered suitable for the purpose to which they are to be applied. Thirdly, The working piece or pieces by their motion, or by their motion and force, produce the useful effect.

Such are the phenomena of the action of a machine, arranged in the order of causation. But in studying or treating of the theory of machines, the order of simplicity is the reverse, and in this the first subject is the modification of motion and force by the train of mechanism; the next the effect or purpose of the machine; and the last, or most complex, is the action of the prime mover.

The modification of motion and the modification of force take place together, and are connected by certain laws; but in the study of the theory of machines, as well as in that of pure mechanics, much advantage has been gained in point of clearness and simplicity by separating the two subjects. But before the principles of the combined modification of motion and force, which are founded both on geometry and on the laws of dynamics, the separation of kinematics from dynamics is due mainly to G. Monge, Ampère and R. Willis.

The theory of machines in the present article will be considered under the following heads:—

I. Pure Mechanism, or Applied Kinematics; being the theory of machines considered simply as modifying motion.

II. Applied Dynamics; being the theory of machines considered as modifying both motion and force.

CHAP. I. ON PURE MECHANISM

§ 22. Division of the Subject.—Proceeding in the order of simplicity, the subject of Pure Mechanism, or Applied Kinematics, may be thus divided:—

Division 1.—Motion of a point.
Division 2.—Motion of the surface of a fluid.
Division 3.—Motion of a rigid solid.
Division 4.—The motion of a train of connected pieces, or of an "elementary combination" in mechanism.
Division 5.—Motions of trains of pieces of mechanism.
Division 6.—Motions of sets of more than two connected pieces, or "aggregates.

A point is the boundary of a line, which is the boundary of a surface, which is the boundary of a volume. Points, lines and surfaces have no independent existence, and consequently those divisions of this chapter which relate to their motions are only preliminary to the subsequent divisions, which relate to the motions of bodies.

Division 1. Motion of a Point.

§ 23. Comparative Motion.—The comparative motion of two points is the relation which exists between their motions, without having regard to their absolute magnitudes. It consists of two elements: the velocity ratio, which is the ratio of any two magnitudes bearing to each other the proportions of the respective velocities of the two points at a given instant, and the directional relation, which is the relative bearing of these two directions of the motions of the two points at the same given instant.

It is obvious that the motions of a pair of points may be varied in any manner, whether by direct or by lateral deviation, and yet the comparative motion may remain constant, in consequence of the deviations taking place in the same proportions, in the same directions and at the same instants for both points.

Robert Willis (1800–1875) has the merit of having been the first to think considerably the theory of pure mechanism, by pointing out that that branch of mechanics relates wholly to comparative motions.

The comparative motion of two points at a given instant is capable of being completely expressed by one of Sir William Hamilton’s Quaternions—the "tensor" expressing the velocity ratio, and the "versor" the directional relation.

Graphical methods of analysis founded on this way of representing velocity and acceleration were developed by R. H. Smith in a paper communicated to the Royal Society of Edinburgh in 1865, and illustrations of the method will be found below.

Division 2. Motion of the Surface of a Fluid Mass.

§ 24. General Principle.—A mass of fluid is used in mechanism to transmit motion and force between two or more movable portions called the "fluid" or "medium." If the fluid be contained in an envelope which prevents the fluid from flowing, and if the fluid is not contained in any envelope, the fluid is said to be free, and if the fluid is contained in an envelope which prevents the fluid from flowing, the fluid is said to be confined, and if it is contained in an envelope which permits the fluid to flow, the fluid is said to be moving. Fluids are then of three kinds, and the fluid mass is either of the kind said to be confined, free or moving.

Let a represent the area of the section of a piston made by a plane perpendicular to its direction of motion, and v its velocity, which is to be considered as positive when outward, and negative when inward. Then the variation of the cubic contents of the vessel in a unit of time by reason of the motion of one piston is av. The condition that the volume of the fluid mass shall remain unchanged requires that there shall be more than one piston, and that the areas and the piston shall be connected by the equation

\[ \Sigma a = \text{constant}. \]

(1)

§ 25. Comparative Motion of Two Pistons.—If there be but two pistons, whose areas are \( a_1 \) and \( a_2 \), and their velocities \( v_1 \) and \( v_2 \), their comparative motion is expressed by the equation

\[ \frac{v_1}{v_2} = \frac{a_2}{a_1}; \]

(2)

that is to say, their velocities are opposite as to inwards and outwards and inversely proportional to their areas.

§ 26. Applications: Hydraulic Press: Pneumatic Power-Transmitting: Use of the hydraulic press as a mode of applying a pressure to a piston, and of a passage connecting them having a valve opening towards the press-barrel. The action of the enclosed water in transmitting a pressure from one piston to the other when the valves are opened. The motion of the pump-plunger moves without a velocity which is less than the inward velocity of the pump-plunger, in the same ratio that the area of the pump-plunger is less than the area of the press-plunger. (See HYDRAULICS.)

In the pneumatic power-transmitter the motion of one piston is
transmitted to another at a distance by means of a mass of air contained in two cylinders and an intervening tube. When the pressure and temperature of the air can be maintained constant, this machine fulfills equation (2), like the hydraulic press. The amount and effect of the variations of pressure and temperature undergone by the air depend on the principles of the mechanical action of heat, or THERMODYNAMICS (q.v.), and are foreign to the subject of pure mechanism.

Division 3. Motion of a Rigid Solid.
§ 27. Motions Classified.—In problems of mechanism, each solid piece of the machine is supposed to be so stiff and strong as not to undergo any sensible change of figure or dimensions by the forces applied to it—a supposition which is realized in practice if the machine is skillfully designed. This being the case, the various possible motions of a rigid solid body may all be classed under the following heads: (1) Shifting or Translation; (2) Turning or Rotation; (3) Motions compounded of Shifting and Turning.

The most common forms for the paths of the points of a piece of mechanism, whose motion is simple shifting, are the straight line and the circle.

Shifting in a straight line is regulated either by a straight fixed guide, in contact with which the moving piece slides, or by combinations of link-work, called parallel motions, which will be described in the sequel. Shifting in a straight line is usually reciprocating; that is, to say, the piece, after shifting through a certain distance, returns to its original position by its own motion. Circular shifting is regulated by attaching two or more points of the shifting piece to ends of equal and parallel rotating cranks, or by combinations of wheel-work to be afterwards described. As an example of circular shifting, it may be cited the motion of the coupling rod, by which the parallel and equal cranks upon two or more axes of a locomotive engine are connected and made to rotate simultaneously. The coupling rod remains always parallel to itself, and all its points describe equal and similar circles relatively to the frame of the engine, and move in parallel directions with equal velocities at the same instant.

§ 28. Rotation about a Fixed Axis: Lever, Wheel, and Axle.—The fixed axis of a turning body is a line fixed relatively to the body and relatively to the space in which the body turns. In mechanism it is usually the central line either of a rotating shaft or axle having journals, gauges, or pivots turning in fixed bearings or a fixed centre round which a revolving piece rotates. It may be, however, that in any turning body, the fixed axis is not the central line, but some line is taken as the axis of the body then the motion is described about that fixed axis as the polar axis.

Let the angular velocity of the rotation be denoted by \( \omega = \frac{d\theta}{dt} \), then the linear velocity of any point \( A \) at the distance \( r \) from the axis is \( r\omega \); and the path of that point is a circle of the radius \( r \) described about the axis.

This is the principle of the modification of motion by the lever, which consists of a rigid body turning about a fixed axis called a fulcrum, and having two points at the same or different distances from the fulcrum, and having the same or different velocities. One receives motion and the other transmits motion, modified in direction and velocity according to the above law.

In the wheel and axle, motion is received and transmitted by two cylindrical surfaces of different radii described about their common fixed axis of turning, their velocity-ratio being that of their radii.

§ 29. Velocity Ratio of Components of Motion.—As the distance between any two points in a rigid body is invariably, the projections of their velocities upon the line joining them must be equal. Hence it follows that, if \( A \) in fig. 90 be a point in a rigid body \( CD \), rotating round the fixed axis \( F \), the component of the velocity of \( A \) in any direction \( AP \) parallel to the plane of rotation is equal to the total velocity of the point \( A \), in the line of direction of the line of projection of this velocity into the plane of the figure, being the line \( FM \) perpendicular to \( AP \), that is to say, is equal to \( a \cdot FM \).

Hence also the ratio of the components of the velocities of two points \( A \) and \( B \) in the directions \( AP \) and \( BW \) respectively, both in the plane of rotation, is equal to the ratio of the perpendiculars \( FM \) and \( Fm \).

§ 30. Instantaneous Axis of a Cylinder rolling on a Cylinder.—Let a cylinder \( bb \), whose axis of figure is \( B \) and angular velocity \( \gamma \), roll on the surface \( aa \), whose axis of figure is \( A \), and the direction of its motion be shown by the line \( AB \) (as in fig. 91), when the rolling will be towards the same hand as the rotation, or inside (as in fig. 92), when the rolling will be towards the opposite hand; and at a given instant let \( T \) be the line of contact of the two cylindrical surfaces, which is at their common intersection with the plane \( AB \) traversing the two axes of figure.

The line \( T \) on the surface \( bb \) has for the instant no velocity in a direction perpendicular to \( AB \); because for the instant it touches, without sliding, the line \( T \) on the fixed surface \( aa \).

The line \( T \) on the surface \( bb \) has also for the instant no velocity in the plane \( AB \), for it has just ceased to move towards the fixed surface \( aa \), and is just about to begin to move away from that surface.

The line of contact \( T \), therefore, on the surface of the cylinder \( bb \), is for the instant at rest, and is the "instantaneous axis" of the cylinder \( bb \) for the instant.

**Fig. 91.**

**Fig. 92.**

**Fig. 93.**
that is, the angular velocity about each axis is proportional to the sine of the angle between the other two.

Demonstration.—From C draw CF perpendicular to OA, and CG perpendicular to OE

Then \( CF = \frac{\text{area} \text{ECO}}{CE} \)

and \( CG = \frac{\text{area} \text{ECO}}{OE} \)

\( \therefore \ CG : CF :: CE = OD : OE \)

Let \( t_a \) denote the linear velocity of the point C. Then

\( t_a = \alpha \cdot CE \)

which is one part of the solution above stated. From E draw EH perpendicular to OB, and EK to OA. Then it can be shown as before that

\( \text{EK} : \text{EH} :: \text{OC} : \text{OD} \).

Let \( v_a \) be the linear velocity of the point E fixed in the plane of axes AOB. Then

\( v_a = \beta \cdot PQ \).

Now, as the line of contact OT is for the instant at the rolling cone as well as at the fixed cone, the linear velocity of the point E fixed to the plane AOB relatively to the rolling cone is the same with its velocity relatively to the fixed cone. That is to say,

\( \beta \cdot \text{EH} = \alpha \cdot \text{EK} \); therefore

\( \alpha \cdot \beta \cdot \text{EH} = \beta \cdot \text{EK} : \text{OC} :: \text{OD} : \text{OC} \),

which is the remainder of the solution.

The path of a point P in or attached to the rolling cone is a spherical epicycloid lying on the surface of a sphere of the radius OP. From P draw PQ perpendicular to the instantaneous axis. Then the motion of P is perpendicular to the plane OPQ, and its velocity is

\( v_a = \gamma \cdot PQ \).

The whole of the foregoing reasonings are applicable, not merely when A and B are actual regular cones, but also when they are the osculating regular cones of a pair of irregular conical surfaces, having a common apex O. O.

§ 32. Screw-like or Helical Motion.—Since any displacement in a plane can be represented in general by a rotation, it follows that the only combination of translation and rotation, in which a complex movement which is not a mere rotation is produced, occurs when there is a translation perpendicular to the plane and parallel to the axis of rotation.

Such a complex motion is called screw-like or helical motion; for each point in the body describes a helix or screw round the axis of rotation, fixed or instantaneous as the case may be. To cause a body to move in this manner it is usually made of a helical or screw-like figure, and moved in a plane of a corresponding figure. Helical motions, and screws adapted to it are said to be right- or left-handed according to the appearance presented by the rotation to an observer looking towards the direction of translation. Thus the screw G in fig. 94 is right-handed.

The translation of a body in helical motion is called its advance. Let \( v_a \) denote the velocity of advance at a given instant, which of course is common to all the particles of the body; \( a \) the angular velocity of the rotation at the same instant; \( 2\pi \cdot 62582 \) nearly, the circumference of a circle of the radius unity. Then

\( T = \frac{2\pi}{a} \)

is the time of one turn at the rate \( a \); and

\( p = \frac{v_a}{T} = \frac{2\pi a}{a} \)

is the pitch or advance per turn—a length which expresses the comparative motion of the translation and the rotation.

The pitch of a screw is the distance, measured parallel to its axis, between two successive turns of the same thread or helical projection. Let \( r \) be the perpendicular distance of a point in a body moving helically from the axis. Then

\( t_v = ar \)

is the component of the velocity of that point in a plane perpendicular to the axis, and its total velocity is

\( v = \sqrt{v_a^2 + v_p^2} \).

\( \therefore \)

(13)

The ratio of the two components of that velocity is

\( \frac{v_p}{v_a} = \frac{\beta}{2\pi a} = \tan \theta \).

\( \therefore \)

(14)

where \( \theta \) denotes the angle made by the helical path of the point with a plane perpendicular to the axis.

Division 4. Elementary Combinations in Mechanism

§ 33. Definitions.—An elementary combination in mechanism consists of two pieces whose kinds of motion are determined by their connexion with the frame, and their comparative motion by their connexion with each other—that connexion being effected either by direct contact of the pieces, or by a connecting piece, which is not connected with the frame, and whose motion depends entirely on the motions of the pieces which it connects.

The piece whose motion is the cause is called the driver; the piece whose motion is the effect is called the follower.

The connexion of each of those two pieces with the frame is in general such as to determine the path of every point in it. In the investigation, therefore, of the comparative motion of the driver and follower, in an elementary combination, it is unnecessary to consider relations of angular direction, which are already fixed by the connexion of each piece with the frame; so that the inquiry is confined to the determination of the velocity ratio, and of the direction of motion, so far only as it expresses the connexion between forward and backward movements of the driver and follower. When a continuous motion of the driver produces a continuous motion of the follower, forward or backward, and a reciprocating motion a reciprocating motion at the same instant, the direction of motion is said to be constant. When a continuous motion produces a reciprocating motion, or vice versa, or when a reciprocating motion produces a motion not reciprocating at the same instant, the directional relation is said to be variable.

The line of action or of connexion of the driver and follower is a line traversing a pair of points in the driver and follower respectively, which are so connected that the component of their velocity relatively to each other, resolved along the line of connexion, is null. There may be several or an indefinite number of lines of connexion, or there may be but one; and a line of connexion may connect either the same pair of points or a succession of different pairs.

§ 34. General Principle.—From the definition of a line of connexion it follows that the components of the velocities of a pair of connected points along their line of connexion are equal. And from this, and from the property of a rigid body, already stated in \( \S \) 29, it follows, that any line of connexion along which the components of the velocities of the points traversed by that line, whether in the driver or in the follower, are equal; and consequently, that the velocities of any pair of points traversed by a line of connexion are to each other inversely as the cosines, or directly as the sines, of the angles made by the paths of those points with the line of connexion.

The general principle stated above in different forms serves to solve every problem in which—the mode of connexion of a pair of pieces is given—its connexion is required to find their comparative motion at a given instant, or vice versa.

§ 35. Application to a Pair of Shifting Pieces.—In fig. 95, let \( P_1V_1 \) be the line of connexion of a pair of pieces, each of which has a motion of translation given. Through any point \( T \) in that line draw \( TV_T \), \( TV_2 \), respectively parallel to the simultaneous direction of motion of the pieces; through any other point \( A \) in the line of connexion draw a plane perpendicular to that line, cutting \( TV_T \), \( TV_2 \) in \( V_T \), \( V_2 \); then, velocity of piece 1: velocity of piece 2 :: \( TV_T \) : \( TV_2 \).

Also TA represents the equal components of the velocities of the pieces parallel to their line of connexion, and the line \( V_TV_2 \) represents their velocity relatively to each other.

§ 36. Application to a Pair of Turning Pieces.—Let \( a_1, a_2 \) be the angular velocities of a pair of turning pieces; \( \theta_1, \theta_2 \) the angles which their line of connexion makes with their respective planes of rotation; \( r_1, r_2 \) the common perpendiculars let fall from the line of connexion upon the respective axes of rotation of the pieces. Then the equal components, along the line of connexion, of the velocities of the points where those perpendiculars meet that line are

\[ a_1 \cos \theta_1 = a_2 \cos \theta_2 \]

consequently, the comparative motion of the pieces is given by the equation

\[ \frac{a_1}{a_2} = \frac{\cos \theta_1}{\cos \theta_2} \]

\( \therefore \)

(15)

§ 37. Application to a Shifting Piece and a Turning Piece.—Let a shifting piece be connected with a turning piece, and at a given instant let be the angular velocity of the turning piece, \( a_1 \) the angular velocity of the shifting piece, \( \theta_1 \) the angle made by the line of connexion with the plane of rotation, \( \theta_2 \) the angle made by the line of connexion with the direction of motion of the shifting piece, \( v_2 \) the linear velocity of that piece. Then

\[ a_1 \cos \theta_1 = v_2 \cos \theta_2 \]

\( \therefore \)

(16)

which equation expresses the comparative motion of the two pieces.

§ 38. Classification of Elementary Combinations in Mechanism.—The first systematic classification of elementary combinations in mechanism was that founded by Monge, and fully developed by Lanz and Bétancourt, which has been generally received, and has been adopted in most treatises on applied mechanics. But that classification is founded on the absolute instead of the comparative
motions of the pieces, and is, for that reason, defective, as Willis pointed out in his admirable treatise On the Principles of Mechanism. Willis's classification is founded, in the first place, on comparative motion, as expressed by velocity ratio and direction relation, and in the second place, on the mode of connexion of the driver and follower. He divides the elementary combinations in mechanism into three classes, of which the characters are as follows:—

Class A: Directional relation constant; velocity ratio constant.

Class B: Directional relation changing periodically; velocity ratio constant or varying.

Each of these classes is subdivided by Willis into five divisions, of which the characters are as follows:

Division A: Connecting by rolling contact.

In the Reuleaux system of analysis of mechanisms the principle of comparative motion is generalized, and mechanisms apparently very diverse in character are shown to be founded on the same sequence of elementary combinations forming a kinematic chain. A short account of this system is given in § 80, but it is not in the article the principle of Willis's classification is followed mainly. The arrangement is, however, modified by taking the mode of connexion as the basis of the primary classification, and by removing the series of connected reducing gear arrangements known as the plan of wheels. This modified arrangement is adopted as being better suited than the original arrangement to the limits of an article in an encyclopaedia; but it is not disputed that the original arrangement is the most useful for the purposes of designing gear mechanisms, and it will be found most frequently used in the following treatment of the subject.

§ 39. Rolling Contact; Smooth Wheels and Racks.—In order that two pieces may move in rolling contact, it is necessary that each pair of points in the two pieces which touch each other should at the same time move in the same direction with the same velocity. In the case of two shifting pieces this would involve equal and parallel velocities for all the points of each piece, so that there could be no rolling, and, in fact, the two pieces would move like one; hence, in the case of rolling contact, either one or both of the pieces must be moveable.

The direction of motion of a point in a turning piece being perpendicular to a plane passing through its axis, the condition that each pair of points in contact with each other must move in the same direction with the same velocity is, therefore:

I. That, when both pieces rotate, their axes, and all their points of contact, lie in the same plane.

II. That, when one piece rotates, and the other slides, the axis of the sliding piece, and all the points of contact, lie in a plane perpendicular to the direction of motion of the shifting piece.

The condition that the velocity of each pair of points of contact must be equal leads to the following consequences:

IV. That the linear velocity of every point in the turning pieces in rolling contact must be inversely as the perpendicular distances of any pair of points of contact from the respective axes.

V. That the linear velocity of a point in the turning piece is equal to the product of the angular velocity of the turning piece by the perpendicular distance from its axis to a pair of points of contact. The line of contact is the line in which the points of contact are all the second order. This is confirmed by the above Principles I. and IV. and lead to the following conclusions:

V. That for a pair of turning pieces with parallel axes, and for a turning piece and a shifting piece, the line of contact is straight, and parallel to the axes or axis; and hence that the rolling surfaces are either plane or cylindrical (the term "conical" including all surfaces generated by the motion of a straight line parallel to itself).

VI. That for a pair of turning pieces with intersecting axes the line of contact is also straight, and traverses the point of intersection of the axes; and hence that the rolling surfaces are conical, with a common apex (the term "conical" including all surfaces generated by the motion of a straight line which traverses a fixed point).

Turning pieces in rolling contact are called smooth or toothless wheels. Shifting pieces in rolling contact with turning pieces may be called smooth or toothless racks.

§ 40. Cylindrical Wheels and Smooth Racks.—In designing cylindrical wheels and smooth racks, and determining their comparative motions, it is sufficient to consider the case of the pair of pieces made by a plane perpendicular to the axis or axis.

The points where axes intersect the plane of section are called centres; the point where the line of contact intersects it, the point of contact, or pitch-point; and the wheels are described as circular, elliptical, &c., according to the form of their sections made by that plane.

When the point of contact of two wheels lies between their centres, they are said to be in outside gearing; when beyond their centres, in inside gearing, because the rolling surface of the larger wheel must in this case be turned inward or towards its centre.

From Principle III. of § 39 it appears that the angular velocity-ratio of a pair of wheels is the inverse ratio of the distances of the point of contact from the centres respectively.

For outside gearing that ratio is negative, because the wheels turn contrary ways; for inside gearing it is positive, because they turn the same way.

If the velocity ratio is to be constant, as in Willis's Class A, the wheels must be circular; and this is the most common form for wheels. The velocity ratio is then to be variable, as in Willis's Class B, the figures of the wheels are a pair of rolling curves, subject to the condition that the distance between their poles (which are the centres of rotation) shall be constant.

The following is the equation which must exist between such a pair of curves:

\[ \frac{\text{OC}_1}{\text{OC}_2} = r_1 \]

Let \( \text{OC}_1, \text{OC}_2 \) (fig. 96) be the poles of a pair of rolling curves; \( \text{T}_1, \text{T}_2 \) any pair of points of contact; \( \text{U}_1, \text{U}_2 \) any other pair of points of contact.

Then, for every possible pair of points of contact, the two following equations must be simultaneously fulfilled:

\[ \sum \text{rad} \cdot \text{rad} = \text{constant} \]

\[ \text{dr}_1 \cdot \text{dr}_2 = \text{ds} \]

which is the differential equation of a pair of rolling curves whose poles are at a constant distance apart.

For full details as to rolling curves, see Willis's work already mentioned, and Clerk Maxwell's paper on Rolling Curves, Trans. Roy. Soc. Edinb. 1849.

A rack, to work with a circular wheel, must be straight. To work with a wheel of any other figure, its section must be a rolling curve, subject to the condition that the perpendicular distance from the curve to the curve shall be equal and contrary; or, designating by \( r_1, r_2 \) the radii- vectores of the given pair of points of contact, and \( s \) the length of the equal arcs measured from a certain fixed pair of points of contact,

\[ r_1 \cos \theta = s \]

is the differential equation of the pair of rolling curves.

To illustrate this subject, it may be mentioned that an ellipse rolling about one focus rolls completely round in outside gearing with a pitch curve, and establishing about one focus, the distance between the axes of rotation being equal to the major axis of the ellipses, and the velocity ratio varying from \(+1\)-eccentricity to \(-1\)-eccentricity; an hyperbola rotating about its further focus rolls inside the ellipse, through a limited arc, with an equal and similar hyperbola rotating about its nearer focus, the distance between the axes of rotation being equal to the axis of the hyperbolas, and the velocity ratio varying between \(+1\)-eccentricity and \(-1\)-eccentricity; and a parabola rotating about its focus rolls with an equal and similar parabola, shifting parallel to its directrix.

§ 41. Conical or Bevel and Disk Wheels.—From Principles III. and VI. of § 39 it appears that the angular velocities of a pair of wheels whose axes meet in a point are to each other inversely as the distances of the axes of the wheels and the axis of the wheel with the line of contact. Hence we have the following construction (figs. 97 and 98).

Let \( O \) be the apex or point of intersection of the two axes \( OC_1, OC_2 \). The angular velocity ratio being given, it is the problem of the line of contact. On \( OC_1, OC_2 \) take lengths \( OA, OB \) respectively, proportional to the angular velocities of the pieces on which the contact is taken. Complete the parallelogram \( OAE_1A' \); the diagonal \( OET \) will be the line of contact required.

Subsequently, when the velocity ratio is variable, the line of contact will shift its position in the planes \( OC_1, OC_2 \), and the wheels will be cones, with eccentric or irregular bases. In every case which occurs in practice, however, the velocity ratio is constant; the line of contact is constant in position, and the rolling surfaces of the wheels are regular circular cones (when they are called bevel wheels); or one of a pair of wheels may have a flat disk
sliding takes place between them in a direction across their lines of contact.

The pitch-surfaces of a pair of toothed wheels are the ideal smooth surfaces which would assume the shape of motion between the contact that the actual wheels have by the sliding contact of their teeth. The pitch-circles of a pair of circular toothed wheels are sections of their pitch-surfaces, made for spur-wheels (that is, for wheels whose axes are supposed to be parallel or collinear) by a plane normal to the pitch-surface of the cooperating wheels, and for bevel wheels by a sphere described about the common apex. For a pair of skew-bevel wheels the pitch-circles are a pair of contiguous rectangular sections of the pitch-surfaces.

The pitch-point is the point of contact of the pitch-circles.

The direction, measured along the pitch-circle, from the face of one tooth to the face of the next, is called the pitch. The pitch and the number of teeth in wheels are regulated by the following principles:

1. In wheels which rotate continuously for one revolution or more, it is obviously necessary that the pitch should be an aliquot part of the circumference.

In wheels which reciprocate without performing a complete revolution this condition is not necessary. Such wheels are called

II. In order that a pair of wheels, or a wheel and a rack, may work correctly together, it is in all cases essential that the pitch should be the same in each.

III. Hence, in any pair of circular wheels which work together, the numbers of teeth in a complete circumference are directly as the radii and inversely as the angular velocities.

IV. Hence also, in any pair of circular wheels which rotate continuously for one revolution or more, the ratio of the numbers of teeth and the angular velocity must be expressible in whole numbers.

From this principle arises problems of a kind which will be referred to in treating of Trains of Mechanism.

D. The numbers of teeth in a pair of wheels, N being the greater. Let t, T be a pair of teeth in the smaller and larger wheel respectively, which at a particular instant work together. It is required to find, first, how many pairs of teeth there are of the pitch-circles of which the tooth t and T work together again (let this number be called c); and, secondly, how many different teeth of the larger wheel the tooth t will work at different times (let this number be called d); finally, with how many parallel teeth of the smaller wheel the tooth T will work at different times (let this be called e).

CASE 1. If n is a divisor of N,
\[ a = N; b = N/n - 1. \]

CASE 2. If the greatest common divisor of N and n be d, a number less than n, so that \( n = md, N = Md \); then
\[ a = mN = M = M - bd; b = M - cm. \]

CASE 3. If N and n be prime to each other,
\[ a = nN; b = N; c = n. \]

It is desirable that by millwrights, with a view to the preservation of the shape of the pitch of each pair of wheels, that each given tooth in one wheel should work with such different teeth in the other wheel as possible. They therefore study that the numbers of teeth in each pair of wheels which work together shall either be prime to each other, or shall have their greatest common divisor as small as is consistent with a velocity ratio suitable for the purposes of the machine.

§ 45. Sliding Contact: Forms of the Teeth of Spur-wheels and Racks.

A line of contact is a piece of a pitch-surface in which two points of contact are in a line perpendicular to the pitch-surface at point where they touch. Bearing this in mind, the principle of the comparative motion of a pair of teeth belonging to a pair of spur-wheels, or to a spur-wheel and a rack, is found by applying the principles stated generally in §§ 36, 37 to the case of the line of contact of a pair of spur-wheels, and to the case of an axis perpendicular to the direction of shifting for a wheel and a rack.

In fig. 101, let C1, C2 be the centres of a pair of spur-wheels; B1, B2, B3 points of their pitch-circles, touching at 1, the pitch-point. Let the wheel 1 be driven, and the wheel 2 the follower.
Let $D_1T$, $B_2A_2$, $D_2T$, $B_1A_1$ be the positions, at a given instant, of the teeth in the driver and follower respectively, touching each other at $T$; the line of connexion of $D_1T$, $B_2A_2$ is called the line of contact which is parallel to their surfaces at $T$. Let $C_1P$, $C_2P_2$ be perpendiculars let fall from the centres of the base-circles to the line of contact. Then, by § 36, the angular velocity is

$$\omega = \frac{a_2 - a_1}{C_1P_1/C_2P_2}$$

(23)

The following principles regulate the forms of the teeth and their relative motions:

I. The angular velocity ratio due to the sliding contact of the teeth will be the same with that due to the rolling contact of the pitch-circles, if the line of centres of the teeth $P_1P_2$ at the pitch-point.

For, let $P_1P_2$ cut the line of centres at $T$; then, by similar triangles,

$$a_1 = C_1P_1 = C_2P_2 = C_1I : C_1I$$

(24)

which is also the angular velocity ratio due to the rolling contact of the circles $B_1B_2$.

This path is bounded by the forms of all teeth of spur-wheels. It also determines the forms of the teeth of straight racks, if one of the centres be removed, and a straight line $EIE'$, parallel to the direction of motion of the rack, and perpendicular to $C_1C_2$, be substituted for a pitch-circle.

II. The component of the velocity of the point of contact of the teeth $T$ along the line of connexion is

$$a_3 = C_1P_1 = C_2P_2$$

(25)

The relative velocity perpendicular to $P_1P_2$ of the teeth at their point of contact—that is, their velocity of sliding on each other—is found by supposing one of the wheels, such as $1$, to be fixed; the line of centres $C_1C_2$ to rotate backwards round $C_1$ with the angular velocity $a_3$ and the point $P_1$ made to slide along $C_1C_2$ with the angular velocity $a_3$ relatively to the line of centres $C_1C_2$ so as to have the same motion as if its pitch-circle rolled on the pitch-circle of the first wheel. Thus the relative motion of the wheels is unchanged; but $1$ is considered as fixed, and $2$ has a relative motion, that is, a rotation about the instantaneous axis $I$, with the angular velocity $a_3$. Hence the velocity of sliding is that due to this rotation about $1$, with the radius $IT$; that is to say, its value is

$$a_3 + a_3 = IT$$

(26)

so that it is greater the farther the point of contact is from the line of centres, and at the instant when that point passes the line of centres, and coincides with the pitch-point, the velocity of sliding is null, and the action of the teeth is, for the instant, that of rolling contact.

IV. The path of contact is the line traversing the various positions of the point $T$. If the line of connexion preserves always the same position relative to the path of contact coincides with it, and is straight; in other cases the path of contact is curved.

It is divided by the pitch-point into two parts—the arc or line of approach described by $T$ in approaching the line of centres, and the arc or line of recess described by $T$ after having passed the line of centres.

During the approach, the flank $B_1A_1$ of the driving tooth drives the face $D_1B_1$ of the following tooth, and the teeth are sliding towards each other, and vice versa; but when the position of the teeth is exemplified in the figure by curves marked with accented letters), the face $B_1A_1$ of the driving tooth drives the flank $D_1B_1$ of the following tooth, and the teeth are sliding from each other.

In practice it is found desirable that the mean value of the obliquity of action during the contact of teeth should not exceed $15^\circ$, nor the maximum value $30^\circ$.

It is unnecessary to give separate figures and demonstrations for inside gearing. The only modification required in the formula is that in equation (26) the difference of the angular velocities should be substituted for their sum.

§ 45. Involute Teeth.—The simplest form of tooth which fulfils the conditions of § 45 is obtained in the following manner (see fig. 102). Let $C_1$, $C_2$ be the centres of two wheels, $B_1B_1'$, $B_2B_2'$ their pitch-circles, $I$ the pitch-point; let the obliquity of action of the teeth be constant, so that the same straight line $P_1P_2$ shall represent at once the constant line of connexion of teeth and the path of contact. Draw $C_1P_1$, $C_2P_2$ perpendicular to $P_1P_2$, and with those lines as radii describe about the centres of the wheels the circles $C_1C_1'$, $C_2C_2'$. It is evident that the radii of the base-circles bear to each other the same proportions as the radii of the pitch-circles, and also that

$$C_1B_1 = C_1C_1' \cos \text{obliquity}$$

(27)

$C_2B_2 = C_2C_2' \cos \text{obliquity}$

(The obliquity which is found to answer best in practice is about $14^\circ$; its cosine is about $0.995$, and its sine about $0.129$. These values though not absolutely exact, are near enough to the truth for practical purposes.)

Suppose the base-circles to be a pair of circular pulleys connected by means of a cord whose course is such as to pull the pulley from the left towards the right.

As the line of connexion of those pulleys is the same as that of the proposed teeth, they will rotate with the required obliquity. Now, suppose a tracing-point $T$ to be fixed to the cord, so as to be carried along the path of contact $P_1P_2$, that point will trace a circle rotating about the point $I$ of the base-circle $D_2D_2'$, and on a plane perpendicular to the axis $C_2C_2$ of the involute of the base-circle $D_2D_2'$; and the two curves so traced will always touch each other at the required point of contact $T$, and will therefore fulfil the condition required by Principle I. of § 45.

Consequently, one of the forms suitable for the teeth of wheels is the involute of a circle; and the obliquity of the action of such teeth is the angle whose cosine is the ratio of the radius of the base-circle to that of the pitch-circle of the wheel.

All involute teeth of the same pitch work smoothly together.

To find the length of the path of contact on either side of the pitch-point, it is to be observed that the distance between the pitch-point and the centres of contact, as measured along $P_1P_2$, is less than the pitch in the ratio of cos obliquity = $1.0$; and consequently that, if distances equal to the pitch be marked off either way from $I$ towards $P_1$ and $P_2$ respectively, as the extremities of the path of contact, and are connected with the path $P_1P_2$, the base-circles will be described through the points so found, there will always be at least two pairs of teeth in action at once.

In practice it is usual to make the path of contact somewhat longer, viz. about twice the length of the pitch; but the teeth so formed will be incorrect, and the obliquity already mentioned of $14^\circ$, the addendum is about $3^\circ$ of the pitch.

The teeth of a rack, to work correctly with wheels having involute teeth, should have plane surfaces perpendicular to the line of connexion, and coincident with the direction of motion of the rack; thus an addendum of $1^\circ$ or $2^\circ$ centimetres on the base-circles of the teeth and obliquity of action of $1^\circ$ or $2^\circ$ will be sufficient to prevent any possible contact, viz. the straight line $AT$ with the length of path, and the obliquity so formed figures will be assumed for the path of contact, and the corresponding forms of the teeth found by determining what curves have the same point $T$, moving along the assumed path of contact, will trace on two teeth rotating round the centres of the wheels with velocities bearing that relation to the component velocity of $T$ along $TI$, which is given by Principle II. of § 45, and by equation (25). This method of finding the forms of the teeth of wheels forms the subject of an elaborate and most interesting treatise by Edward Sang.

All wheels having teeth of the same pitch, traced from the same path of contact, work correctly together, and are said to belong to the same form.

§ 48. Teeth traced by Rolling Curves.—If any curve $R$ (fig. 103) be rolled on the inside of the pitch-circle $BB'$ of a wheel, it appears, from § 30, that the instantaneous axis of the rolling curve at any instant will be at the point $I$, where it touches the pitch-circle for the moment, and consequently the line $AT$, traced by a tracing-point $T$, fixed to the rolling curve at the point $I$, of the wheel, will be everywhere perpendicular to the straight line $TI$; so that the same traced line will be suitable for the flank of a tooth, in which $T$ is the point of contact corresponding to the position $I$ of the pitch-point. If the
same rolling circle R, with the same tracing-point T, be rolled on the outside of any other pitch-circle, it will have the face of a tooth suitable to work with the flank AT.

In like manner, if either the same or any other rolling curve R' be rolled on the pitch-circle of the same rolling circle BB, so that the tracing point T' shall start from a, it will trace the flank AT' of a tooth suitable to work with a flank traced by rolling the same curve R' with the same tracing-point T' inside any other pitch-circle BB'.

The figure of the path of contact is that traced on a fixed plane by the tracing-point, when the rolling curve is rotated in such a manner as always to touch a fixed straight line EIE (or ET'E'), as the case may be, at a fixed point I.

If the same rolling curve and tracing-point be used to trace both the faces and the flanks of the teeth of a number of different sizes but of the same pitch, all those wheels will work correctly together and will form a set. The teeth of a rack, of the same set, are traced by rolling the rolling curve on both sides of a straight-line.

The teeth of wheels of any figure, as well as of circular wheels, may be traced by rolling curves on their pitch-surfaces; and all teeth of the same pitch, traced by the same rolling curve with the same tracing-point, will work together correctly if their pitch-surfaces are in rolling contact.

§ 49. Epicycloidal Teeth.—The most convenient rolling curve is the circle. The path of contact will be such that the rolling curve is tangent to itself; and the flanks of the teeth are internal and their faces external epicycloids for wheels, and both edges and faces are epicycloids for a rack.

For a pitch-circle of twice the radius of the rolling or describing circle (as it is called) the internal surface of the epicycloid is a straight line, being, in fact, a diameter of the pitch-circle, so that the flanks of the teeth formed by a pitch-circle are planes radiating from the axis. For a smaller pitch-circle the flanks would be convex and incurved or under-cut, which would be disadvantageous; therefore the smallest wheel of a set should have its pitch-circle of twice the radius of the describing circle, so that the flanks of the teeth formed by it shall be a straight line.

The obliquity of the action in the passing line of the centres is nothing; the maximum obliquity is the angle EID = EID'; and the mean obliquity is one-half of that angle.

It appears from experience that the mean obliquity should not exceed 15°; therefore the maximum obliquity should be about 30°; therefore the equal arcs DI and ID' should each be one-sixth of a circumference; therefore the circumference of the describing circle should be six times the pitch.

It follows that the smallest pinion of a set in which pinions the flanks are straight should have twelve teeth.

§ 50. Nearly Epicycloidal Teeth; Willis's Method.—To facilitate the drawing of epicycloidal teeth in practice, Willis showed how to approximate to their figure means of two circular arcs—one concave for the flank, and the other convex, for the face—and each having for its radius the mean radius of curvature of the epicycloidal arc. Willis's formulae are founded on the following properties of epicycloids:

Let R be the radius of the pitch-circle; r that of the describing circle; θ the angle made by the normal TI to the epicycloid at a given point T, with a tangent to the circle at 1—that is, the obliquity of the action at T.

Then the radius of curvature of the epicycloid at T is:

For an internal epicycloid, \( r' = 2r \sin \theta \)

For an external epicycloid, \( r' = 2r \cos \theta \)

Also, to find the position of the centres of curvature relatively to the pitch-circle, we have, denoting the chord of the describing circle TI by c, \( c = 2r \sin \theta \); and therefore

For the flank, \( r - c = 2r \sin \theta \)

For the face, \( r - c = 2r \cos \theta \)

For the proportions of the epicycloids by Willis, sin \( \theta = \frac{1}{2} \) nearly; \( r = \rho \) (the pitch) nearly; \( c = \frac{3}{2} \rho \) nearly; and, if \( N \) be the number of teeth in the wheel, \( r/R = 6/N \) nearly; therefore, approximately,

\[
\rho - c = \rho - 2r \sin \theta = 2r \sin \theta \approx \frac{6}{N} \approx \frac{3}{N} \\
\rho - c = \rho - 2r \cos \theta = 2r \cos \theta \\
\rho - c = \rho - 2r \sin \theta = 2r \sin \theta \
\]

Hence the following construction (fig. 105). Let BB' be part of the pitch-circle, and e the point where a tooth is to cross it. Set off \( ab = ae = \frac{1}{2}p \). Draw radii \( bd, ce \); draw \( fb, cg \), making angles of \( \frac{3}{2} \rho \) with those radii, make \( fb = \rho - c \), and from \( f, \) with the radius \( fs, \) draw the circular arc \( ak \); from \( g, \) with the radius \( ga, \) draw the circular arc \( ak \). Then the arc \( ak \) is the face and \( ak \) the flank of the tooth required.

To facilitate the application of this rule, Willis published tables of \( \rho - c \) and \( r - c \), and invented an instrument called the "odograph."

§ 51. Trunclides and Pin-Wheels.—If a wheel or trunclide have cylindrical pins or staves for teeth, the faces of the teeth of a wheel or trunclide is two on the pitch-circle, and the driving in and out of the teeth is facilitated by first tracing two epicycloids, by rolling the pitch-circle of the pin-wheel or trunclide on the pitch-circle of the driving wheel, with the centre of a face for a tracing-point, and then drawing curves parallel to, and within the epicycloids, at a distance from them equal to the thickness of a stave. Trunclides having only six staves will work with large wheels.

§ 52. Backs of Teeth and Spaces.—Toothed wheels being in general inverted curves, to calculate exactly the backs of the teeth are made similar to the fronts. The space between two teeth, measured on the pitch-circle, is made about \( \frac{1}{10} \) part wider than the thickness of the tooth on the pitch-circle—that is to say,

Thickness of tooth = \( \frac{1}{10} \) pitch.

Width of space = \( \frac{1}{10} \) pitch.

The difference of \( \frac{1}{10} \) of the pitch is called the backlash. The clearance allowed between the points of teeth and the bottoms of the spaces between the teeth of the other wheel is about one-tenth of the pitch.

§ 53. Bevelled and Helical Teeth.—R. J. Hook invented the making of the fronts of teeth in a series of steps with a view to increase the smoothness of action. A wheel thus formed resembles in shape a series of equal and similar toothed disks placed side by side, with the teeth of each a little behind those of the preceding disk. He also invented, with the same object, teeth whose fronts, instead of being parallel to the line of contact of the pitch-circles, cross it obliquely, so as to be of a screw-like or helical form. In wheel-work of this kind the contact of each pair of teeth commences at the commencement of the helix and terminates at the after end; and the helix is of such a pitch that the contact of one pair of teeth shall not terminate until that of the next pair has commenced.

Bevelled and helical teeth have the desired effect of increasing the smoothness of motion, but they require more difficult and expensive workmanship than common teeth; and helical teeth are, besides, open to the objection that they exert a laterally oblique pressure, which increases the obliquity of the action and unduly strains the machinery.

§ 54. Teeth of Bevel-Wheels.—The acting surfaces of the teeth of bevel-wheels are of the conical kind, generated by the motion of a line passing through the common apex of the pitch-comes, while its surface is carried round the outline of the cross section of the teeth made by a sphere described about that apex.

The operations of describing the exact figures of the teeth of bevel-wheels, whether by involutes or by rolling curves, are in every respect analogous to those for describing the figures of the teeth of spur-wheels, except that in the case of bevel-wheels all those operations are to be performed on the surface of a sphere described about the apex instead of on a plane, substituting poles for centres, and great circles for straight lines.

In consideration of the practical difficulty, especially in the case of large wheels, of obtaining an accurate spherical surface, and of drawing upon it when obtained, the following approximate method, proposed originally by Tredgold, is generally used:

Let \( O \) (fig. 106) be the common apex of a pair of bevel-wheels; \( Oa, Ob \), their pitch-comes; \( Oc, Oc' \), their axes; \( OI \) their line of contact. Perpendicular to \( OI \) draw \( A1A2 \), cutting the axes in \( A1, A2 \); make the outer rims of the patterns and of the wheels
portions of the cones $A_1B_1, A_2B_2$, of which the narrow zones occupied by the teeth will be sufficiently near to a spherical surface described about $O$ for practical purposes. To find the figures of the teeth, draw on a flat surface circular arcs $1D_1, 1D_2$, with the radii $A_1, A_2$, the relation between the arcs of the pitch-circles $B_1B_2$, $B_3B_2$ when the conical surfaces $A_1B_1, A_2B_2$ are spread out flat. Describe the figures of teeth for the developed arcs as for a pair of spur-wheels; then wrap the developed arcs on the cones, so as to make the teeth with the pitch-circles, and trace the teeth on the conical surfaces.

§ 55. Teeth of Skew-Bewel Wheels.—The crests of the teeth of a skew-bevel wheel are parallel to the generating straight line of the hyperboloidal pitch-surface; and the transverse sections of the teeth at a given point may be found similar to those of the tooth of a bevel wheel whose pitch surface is a cone touching the hyperboloidal surface at the given circle.

§ 56. Cams.—A cam is a single tooth, either rotating continuously or oscillating, and the sliding or turning piece either constantly or at intervals. All the principles which have been stated in § 45 as being applicable to teeth are applicable to cams; but in designing cams it is not usual to determine or take into consideration the form of the ideal pitch-surface, which would give the same comparative motion by rolling contact that the cam gains by sliding contact.

§ 57. Screws.—The figure of a screw is that of a convex or concave cylinder, with one or more helical projections, called threads, winding round it. Convex and concave screws are distinguished technically by the respective names of male and female; a short concave screw is called a nut; and when a screw is spoken of without qualification a convex screw is usually understood.

The angle $\alpha$, called the pitch, and the rotation, which compose the motion of a screw working in contact with a fixed screw or helical guide, has already been demonstrated in § 32; and the same relation exists between the magnitudes of the rotation of a screw about a fixed axis and the advance of a shifting nut in which it rotates. The advance of the nut takes place in the opposite direction to that of the advance of the screw in the case in which the nut is fixed. The pitch or axial pitch of a screw has the meaning assigned to it in that section, viz. the distance, measured parallel to the axis, between the corresponding points in two successive turns of the same thread.

If, therefore, the screw has several equidistant threads, the true pitch is equal to the divided axial pitch, as measured between two adjacent threads, multiplied by the number of threads.

If a helix be described round the screw, each turn of the thread at right angles, the distance between two corresponding points on two successive turns of the same thread, measured along this normal helix, may be called the normal pitch; and when the screw has more than one thread, the pitch from thread to thread may be called the normal divided pitch.

The distance from thread to thread, measured on a circle described about the axis of the screw, called the pitch-circle, may be called the circumferential pitch; for a screw of one thread it is one circumference; for a screw of $n$ threads, $\frac{n}{\pi}$ circumference.

Let $r$ denote the radius of the pitch circle; $n$ the number of threads; $\theta$ the obliquity of the threads to the pitch circle, and of the normal helix to the axis; then:

\[ p_n = p \cot \theta = p \cos \theta \]
\[ p_n = p \sec \theta = p \tan \theta \]
\[ p = \frac{\pi r}{2} \]
\[ p_n = \frac{\pi r}{2} \sin \theta \]

If a screw rotates, the number of threads which pass a fixed point in one revolution is the number of threads in the screw.

A pair of convex screws, each rotating about its axis, are used as an elementary combination to transmit motion by the sliding contact of their threads. Such screws are commonly called endless screws. At the point of contact of two of these screws their pitch circles will be parallel; and their line of connexion is the common perpendicular to the acting surfaces of the threads at their point of contact.

Hence the following principles:

1. If the threads of the two screws be both right-handed or both left-handed, the angle between the directions of their axes is the sum of their obliquities; if one is right-handed and the other left-handed, that angle is the difference of their obliquities.

2. The normal pitch for a screw of one thread, and the normal divided pitch for a screw of more than one thread, must be the same in each screw.

III. The angular velocities of the screws are inversely as their numbers of threads.

Hooke's wheels with oblique or helical teeth are in fact screws of many threads, and of large diameters as compared with their lengths.

The ordinary position of a pair of endless screws is with their axes at right angles to each other. When one is of considerably larger diameter than the other, the larger is commonly called in practice the lead screw, and the smaller the lead, or "wheel," of the pair. When the larger screw is in a slot in the other and moves relatively to both the two are helically toothed, the pair becomes a screw cutting tool; the larger screw, or "wheel," is carried at the axis of the required figure; the larger screw and the lead screw are fitted up in their proper relative position, and made to rotate in contact with each other by turning the lead screw, which cuts the threads of the larger screw to their correct form.

To make the teeth of a pair of endless screws fit correctly and work smoothly, a hardened steel screw is made of the figure of the lead screw, with threads notched so as to form a cutting tool; the larger screw, or "wheel," is carried at the axis of the required figure; the larger screw and the lead screw are fitted up in their proper relative position, and made to rotate in contact with each other by turning the lead screw, which cuts the threads of the larger screw to their correct form.

§ 58. Coupling of Parallel Axes.—Oldham's Coupling.—A coupling is a mode of connecting a pair of shafts so that they shall rotate in the same direction with the same angular velocity. If the axes of the shafts are in the same straight line, the coupling consists in so connecting their contiguous ends that they shall rotate as one piece; but if the axes are not in the same straight line combinations of mechanism are required. A coupling for parallel shafts which acts by sliding contact was invented by Oldham, and is represented in Fig. 107. C, C₂ are the axes of the two parallel shafts; D₁, D₂ two disks facing each other, fixed on the ends of the shafts respectively; E₁E₂, a bar sliding in a diametral groove in the face of D₁; E₂E₃ a bar sliding in a diametral groove in the face of D₂; those bars are fixed together at A, so as to form a rigid cross. The angular velocities of the bars are the same; and if the cross is revolved by the middle point of the cross, at A, revolves in the dotted circle described upon the line of centres C₃C₄ as a diameter twice for each turn of the disks and cross; the instantaneous axis of rotation of the cross is always in a line diametrically opposite to A.

Oldham's coupling may be used with advantage where the axes of the shafts are intended to be as nearly in the same straight line as is possible, but where there is some doubt as to the practicability or permanency of their exact coincidence.

§ 59. Wrapping Connectors.—Belts, Cords and Chains.—Flat belts of leather or of gutta percha, round cords of catgut, hemp or other material, and metal strips, used as wrapping connectors to transmit rotatory motion between pairs of pulleys and drums.

Belts (the most frequently used of all wrapping connectors) require nearly cylindrical pulleys. A belt tends to move towards that end of a pulley which is in its own plane that has the greatest pitch; pulleys for belts therefore, are usually slotted in the middle, in order that the belt may remain on the pulley, unless forcibly shifted. A belt when in motion is shifted off a pulley, or from one pulley on to another without being alongside it, by pressing against that part of the belt which is moving towards the pulley.

Cords require either cylindrical drums with ledges or grooved pulleys.

Wrapping pulleys or drums, grooved, notched and toothed, so as to fit the links of the chain.

Wrapping connectors for communicating continuous motion are endless.

Wrapping connectors for communicating reciprocating motion have usually their ends made fast to the pulleys or drums which they connect, and which in this case may be sectors.

The line of connexion of two pieces connected by a wrapping connector is the centre line of the belt, cord or chain; and the comparative motions of the pieces are determined by the principles of § 56 if both pieces turn, and of § 37 if one turn and of § 38 if other shifts, in which latter case the motion must be reciprocating.

The pitch-line of a pulley or drum is the circle about which the pitch of the connexion is always a tangent—that is, it is a curve parallel to the acting surface of the pulley or drum, and differing from it by half the thickness of the wrapping connector.

Pulleys and drums for communic-ating a constant velocity ratio are circular. The effective radius, or radius of the pitch-circle of a circular pulley or drum, is equal to the real radius added to half the thickness of the connector. The
angular velocities of a pair of connected circular pulleys or drums are inversely as the effective radii.

A crossed belt, as in fig. 108, A, reverses the direction of the rotation communicated; an uncrossed belt, as in fig. 108, B, preserves that direction.

The length L of an endless belt connecting a pair of pulleys whose effective radii are r\(_1\), r\(_2\), with parallel axes whose distance apart is c, is given by the following formulae, in each of which the first term, containing the radical, expresses the length of the straight parts of the belt, and the remainder of the formula the length of the curved parts.

For a crossed belt:  
\[ L = 2\sqrt{r_1^2 + (r_1 + r_2)^2} - 2\sin^{\frac{1}{2}}(\frac{r_1 + r_2}{c}) \]

and for an uncrossed belt:  
\[ L = 2\sqrt{r_1^2 + (r_1 - r_2)^2} + 2(r_1 - r_2)\sin^{\frac{1}{2}}(\frac{r_1 - r_2}{c}) \]

in which r\(_1\) is the greater radius, and r\(_2\) the less.

When the axes of a pair of pulleys are not parallel, the pulleys should be so placed that the part of the belt which is approaching each pulley shall be in the plane of each pulley that of the small end.

§ 60. Speed-Cones.—A pair of speed-cones (fig. 109) is a contrivance for varying and adjusting the velocity ratio communicated between a pair of parallel shafts by means of a belt. The speed-cones are either continuous cones or conoids, as A, B, whose velocity ratio can be varied gradually while they are in motion by shifting the belt, or sets of pulleys whose radii vary by steps, as C, D, in which case the velocity ratio can be changed by shifting the belt from one pair of these to another.

In order that the belt may fit accurately in every possible position on a pair of speed-cones, the quantity L must be constant, in equations (32 A) or (32 B), according as the belt is crossed or uncrossed.

For a crossed belt, as in A and C, fig. 109, L depends solely on c and on r\(_1\) + r\(_2\). As constant connecting axes are parallel; therefore the sum of the radii of the pitch circles connected in every position is constant.

That condition is fulfilled by a pair of continuous cones generated by the intersection of two straight lines inclined opposite ways to their respective axes at equal angles.

For an uncrossed belt, the quantity L in equation (32 B) is to be made constant. The exact fulfilment of this condition requires the solution of a transcendental equation; but it may be fulfilled with accuracy sufficient for practical purposes by using, instead of (32 B), the following approximate equation:

\[ L \text{nearly } 2c + r_1 + r_2 + (r_1 - r_2)\sqrt{\frac{c}{2}} \]

The following is the most convenient practical rule for the application of this equation.

Let the speed-cones be equal and similar conoids, as in B, fig. 109, but with their large and small ends turned opposite ways. Let r\(_1\) be the radius of the large end of each; r\(_2\) that of the middle; and let v be the sagitta, measured perpendicular to the axes, of the arc by which the revolution each of the conoids is generated, or, in other words, the bulging of the conoids in the middle of their length. Then

\[ v = r_2 - (r_1 + r_2)/2 = (r_1 - r_2)/2\sqrt{c} \]

(34) \[ 2r = 6 - 28.32 \]

but 6 may be used in most practical cases without serious error.

The radii at the middle and ends being thus determined, make the generating curve an arc either of a circle or of a parabola.

§ 61. Linkwork in General.—The pieces which are connected by links are called cranks, beams, and levers. The link by which they are connected is a rigid rod or bar, which may be straight or of any other figure; the straight figure being the most favourable to strength, is always used when there is no special reason to the contrary. The link is named by various names in various circumstances, such as connecting rod, crank-rod, eccentric-rod, &c. It is attached to the pieces which it connects by two pins, about which it is free to turn.

The effect of the link is to maintain the distance between the axes of those pins invariable; hence the common perpendicular of the axis of the pins is the line of connexion, and its extremities may be called the connected points. In a turning piece, the perpendicular let fall from its connected point upon its axis of rotation is the arm or crank-arm.

The axes of rotation of a pair of turning pieces connected by a line are always almost parallel, and perpendicular to the line of connexion, and in which case the angular velocity ratio at any instant is the reciprocal of the ratio of the common perpendiculars let fall from the line of connexion upon the respective axes of rotation.

If at any instant the direction of one of the crank-arms coincides with the line of connexion, the common perpendicular of that line of connexion and the axis of that crank-arm vanishes, and the directions of rotation of the motions becomes indeterminate. The position of the connected point of the crank-arm in question at such a moment is indeterminate, but it is not a dead-point at such a moment.

The velocity of the other connected point at such an instant is zero, and this is the case of connexion is in the plane of the two axes of rotation, in which case the velocity ratio vanishes. For determining the examples of dead-points, and of the means of preventing the inconvenience which they tend to occasion, will appear in the sequel.

§ 62. Coupling of Parallel Axes.—Two or more parallel shafts (such as those of a steam-engine, with two or more pairs of driving wheels) are made to rotate with constant equal angular velocities by having equal cranks, which are maintained parallel by a coupling-rod of such a length that the line of connexion is equal to the sum of the lengths of the crank-arm. The cranks pass their dead-points simultaneously. To obviate the inconvenience which this tends to cause, the shafts are provided with a second set of cranks at right angles to the first, connected by means of a similar coupling-rod, so that one set of cranks pass their dead points at the instant when the other set pass theirs.

§ 63. Comparative Motion of Connected Points.—As the link is a rigid body, it is obvious that its action in communicating motion may be determined by finding the comparative motion of the connected points, and this is often the most convenient method of proceeding.

If a connected point belongs to a turning piece, the direction of its velocity at any instant is perpendicular to the plane containing the axis and crank-rod of the piece.

If a connected point belongs to a shifting piece, the direction of its motion at any instant is given, and a plane can be drawn perpendicular to that direction.

The intersection of the planes perpendicular to the paths of the two connected points at a given instant is the instantaneous axis of the link at that instant; and the velocities of the connected points are directly as the distances from this axis.

In drawing on a plane surface, the two planes perpendicular to the paths of the connected points are represented by two lines (being their sections by a plane normal to them), and the instantaneous axis by a point (fig. 110); and, should the length of two straight lines render it impracticable to produce them until they actually intersect, the velocity ratio of the connected points may be found by the principle that it is equal to the ratio of the segments which a line parallel to the line of connexion cuts off from the two lines drawn from a given point, perpendicular respectively to the paths of the connected points.

To illustrate this by one example. Let C\(_1\) be the axis, and T\(_1\) the connected point of the beam of a steam-engine; T\(_2\) the connecting or crank-rod; T\(_3\) the other connected point, and the centre of the crank-pin; C\(_2\) the axis of the crank and its shaft. Let v\(_1\) denote the velocity of T\(_1\) at any given instant; v\(_2\) that of T\(_2\). To find the ratio of these velocities, produce C\(_1\)T\(_1\), C\(_2\)T\(_3\) till they intersect in K; K is the instantaneous axis of the connecting rod, and the velocity ratio is

\[ v_1/v_2 = \frac{C_1K}{K_2} \]

Should K be inconveniently far off, draw any triangle with its sides respectively parallel C\(_1\)T\(_1\), C\(_2\)T\(_2\) and C\(_2\)T\(_3\); the ratio of the two first mentioned will be the velocity ratio required. For example, draw C\(_2\)A parallel to C\(_1\)T\(_1\), cutting C\(_2\)T\(_2\) in A; then

\[ v_1/v_2 = \frac{C_2A}{C_1T_1} \]

(35) \[ 64. Eccentric.—An eccentric circular disk fixed on a shaft, and used to give a reciprocating motion to a rod, is in effect a crank-pin of sufficiently large diameter that the eccentric is contained in the weakening of the shaft which would arise from bending it so as to form an ordinary crank. The centre of the eccentric is its connecting point; its eccentricity, or the distance from that centre to the axis of the shaft, is its crank-arm.

An eccentric may be made capable of having its eccentricity altered by means of an adjusting screw, so as to vary the extent of the reciprocating motion which it communicates.

§ 65. Reciprocating—Dead-points.—The distance between the extremities of the path of the connected point in a reciprocating piece (such as the piston of a steam-engine) is called the stroke or length of stroke of that piece. When it is connected with a continuously turning piece (such as the crank of a steam-engine) the ends of the stroke of the reciprocating piece correspond to the
lead-points of the path of the connected point of the turning piece, where the line of connection is continuous with or coincides with the crank-arm.

Let $S$ be the length of stroke of the reciprocating piece, $L$ the length of the line of connection, and $R$ the crank-length of the continuously turning piece. Then, if the two ends of the stroke be in one straight line with the axis of the crank,

$$ S = 2R; \quad (37) $$

and if these ends be not in one straight line with that axis, then $S$, $L$, $R$, and $L-R$, are the three sides of a triangle, having the angle opposite $S$ at that axis; so that, if $b$ be the supplement of the arc between the dead-points,

$$ S^2 = (L + R)^2 - 2(L + R) \cos \theta - (L - R)^2 - 2(L - R) \cos \theta $$

$$ \cos \theta = \frac{2L^2 + 2R^2 - S^2}{2(L - R)} \quad (38) $$

§ 66. Coupling of Intersecting Axes—Hooke’s Universal Joint.—

Intersecting axes are coupled by a contrivance of Hooke’s, known as the “universal joint,” which belongs to the class of linkwork (see Fig. 111). Let $O$ be the point of intersection of the axes $OC_1$, $OC_2$, and $\theta$ their angle of inclination to each other. The pair of shafts $C_1$, $C_2$ terminate in a pair of forks $F_1$, $F_2$ in bearings at the extremities of which turn the gudgeons at the ends of the arms of a rectangular cross, having its centre at $O$. This cross is the link; the connected points are the centres of the bearings $F_1$, $F_2$. At each instant, each of those parts moves at right angles to the central plane of its shaft and fork, therefore the line of intersection of the central planes of the two forks at any instant is the perpendicular axis of the cross, and the velocity ratio of the points $F_1$, $F_2$ (which, as the forks are equal, is also the angular velocity ratio of the shafts) is equal to the ratio of the distances of those points from that instantaneous axis. The mean value of that velocity ratio is that of equality, for each successive quarter-turn is made by both shafts in the same time; but its actual value fluctuates between the limits:

$$ a_1 = \frac{1}{\cos \theta} \quad \text{when} \quad F_1 \quad \text{is the plane of} \quad OC_1 \quad \text{axis}, \quad (39) $$

and

$$ a_2 = \cos \theta \quad \text{when} \quad F_2 \quad \text{is in that plane}. $$

Its value at intermediate instants is given by the following equations: let $\phi_1$, $\phi_2$ be the angles respectively made by the central planes of the forks and shafts with the plane $OC_1$ at a given instant; then

$$ \cos \theta = \tan \phi_1 \tan \phi_2 $$

$$ a_1 = - \frac{d \phi_1}{d \phi_2} \tan \phi_1 + \cot \phi_2 $$

$$ a_2 = - \frac{d \phi_2}{d \phi_1} \tan \phi_2 + \cot \phi_1 \quad (40) $$

§ 67. Intermittent Linkwork—Click and Ratchet.—A click acting upon a ratchet-wheel or rack, when it engages or pulls through a certain arc at each forward stroke and leaves at rest each backward stroke, is an example of intermittent linkwork. During the forward stroke the action of the click is governed by the principles of linkwork during the backward stroke that action ceases. A catch or pull, turning on a fixed axis, prevents the ratchet-wheel or rack from reversing its motion.

Division 5.—Trains of Mechanism.

§ 68. General Principles.—A train of mechanism consists of a series of such pieces of each of which a follower to that which drives it and driver to that which follows it.

The comparative motion of the first and last follower is obtained by combining the proportions expressing by their terms the velocity ratios of the several elementary combinations of which the train consists.

§ 69. Trains of Wheelwork.—Let $A_1$, $A_2$, $A_3$, etc., $A_{m-1}$, $A_m$ denote a series of axes, and $a_1$, $a_2$, $a_3$, etc., $a_{m-1}$, $a_m$ their angular velocities. Let the axis $A_1$ carry a wheel of $N_1$ teeth, driving a wheel of $N_2$ teeth on the axis $A_2$, and so on; the numbers of teeth in drivers being denoted by $N$, and in followers by $n$, and the axes to which the wheels are fixed are denoted by numbers. Then the resulting velocity ratio is denoted by

$$ a_1 = a_2 = a_3 = \ldots = a_{n_1} = a_{n_2} = a_{n_3} = \ldots = a_{n_m} \quad (41) $$

that is to say, the velocity ratio of the last and first axes is the ratio of the product of the numbers of teeth in the drivers to the product of the numbers of teeth in the followers.

Supposing all the wheels to be in outside gearing, then, as each elementary combination reverses the direction of rotation, and as the number of elementary combinations $m-1$ is one less than the number of axes $m$, it is evident that if $m$ is odd the direction of rotation is preserved, and if even reversed.

It is often a question of importance to determine the number of teeth in a train of wheels best suited for giving a determinate velocity ratio to two axes. It was shown by Youst that to do this with the least total number of teeth, the velocity ratio of each elementary combination should approximate as nearly as possible to $3:59$. This would in many cases give too many axes; and, as a useful practical arrangement may be laid down, the velocity ratio of an elementary combination in wheelwork.

The smallest number of teeth in a pinion for epicyclical teeth ought to be twelve (see § 49)—but it is better, for smoothness of motion, not to go below fifteen; and for involute teeth the smallest number is about twenty-four.

Let $B/C$ be the velocity ratio required, reduced to its lowest terms, and let $B$ be greater than $C$. If $B/C$ is not greater than 6, and $C$ lies between 2 and 4, the back-gear (or derringer) of the combination may be called $1$ and its double $2$, then one pair of wheels will answer the purpose, and $B$ and $C$ will themselves be the numbers required. Should $B$ and $C$ be inconveniently large, they are, if possible, to be resolved into factors, and those factors (or if they are too small, and $B$ and $C$ are themselves prime numbers), an approximate velocity ratio, found by the method of continued fractions, is to be substituted for $B/C$ as before.

So far as the resultant velocity ratio is concerned, the order of the two wheels is unimportant and does not secure the so-called involute tooth, of which a number of different shapes and effects of wear may be taken. Hence the tooth may be defined as having the same ratio, which has been shown in § 44, that the wheels ought to be so arranged that, for each elementary combination, the greatest common divisor of $N$ and $n$ shall be either $1$, or as small as possible. $70$. Double Hooke’s Couplings.—It has been shown in § 66 that the velocity ratio of a pair of shafts coupled by Hooke’s joint fluctuates between the limits $\cos \theta$ and $1/\cos \theta$.

Hence one or both of the shafts must have a vibrating and unsteady motion, injurious to the mechanism and framework. To obviate this evil a short link is introduced, making the relative motion in the first shaft and last shaft, coupled with each of them, and having its own two shafts in the same plane. Let $a_1$, $a_2$, $a_3$ be the angular velocities of the first, intermediate, and last shaft in this train; then Hooke’s coupling. Then, from the equation $a_2$ it is evident that at each instant $a_3/a_1 = a_3/a_2$ and consequently that $a_3 = a_1$; so that the fluctuations of angular velocity ratio caused by the first coupling are exactly neutralized by the second, and the first and last shafts all have the same angular velocity at each instant.

§ 71. Converging and Diverging Trains of Mechanism.—Two or more trains of mechanism may converge into one—as when two or more trains of mechanism may diverge into two or more—as when a single shaft, driven by a prime mover, carries several pulleys, each of which drives a different machine.

The principles of comparative motion in such converging and diverging trains are the same as in simple trains.

Division 6.—Aggregate Combinations.

§ 72. General Principles.—Willis designated as “aggregate combinations” those assemblages of pieces of mechanism in which the velocity and position of any one of the component motions impressed on it by more than one driver. Two classes of aggregate combinations may be distinguished which, though not different in their actual nature, differ in the data which they present to the designer and in the method of solution to be followed in questions respecting them.

Class I. comprises those cases in which a piece $A$ is not carried directly by the frame $C$, but by another piece $B$, relatively to which the piece $A$ is at rest; the case of a shaft carried on the frame $C$ being also given. Then the motion of $A$ relatively to the frame $C$ is the resultant of the motion of $A$ relatively to $B$ and that resultant relatively to $C$; and that resultant is to be found by the principles already explained in Chapter IV.

Class II. comprises those cases in which the motions of three points in one follower are determined by their connections with two or with three different drivers.

This classification is founded on the kind of problems arising from the combinations. Willis adopts another classification founded on the objects of the combinations, which objects he divides into two classes, viz. (1) to produce aggregate velocity, or a velocity which is the resultant of two or more components in the same plane, and (2) to produce an aggregate path—that is, to make a given point
in a rigid body move in an assigned path by communicating certain motions to other points in that body.

It is seldom that one of these effects is produced without the same time producing the other; but the classification of Willis depends upon whether these two effects, even suppose them to occur together, is the practical object of the mechanism.

§ 73. Differential Windlass.—The axis C (fig. 112) carries a larger barrel AE and a smaller barrel DB, rotating as one piece with the angular velocity $\omega_1$ in the direction AE. The pulley or sheave FG has a weight W hung to its centre. A cord has one end made fast and wrapped round the barrel AE; it passes from A under the sheave FG, and has the other end wrapped round and made fast to the barrel BD. Required the relation between the velocity of translation $\nu$ of W and the angular velocity $\omega_1$ of the differential bar CB.

In this case $\nu$ is an aggregate velocity, produced by the joint action of the two drivers AE and BD, transmitted by wrapping connectors to FG, and combined by that sheave so as to act on the lower W, whose motion is the same with that of the centre of FG.

The velocity of the point F is $\omega_1 AC$, upward motion being considered positive. The velocity of the point G is $-\omega_1 AC$, CB, downward motion being negative. Hence the instantaneous axis of the sheave FG is in the diameter FG, at the distance

$$FG = \frac{AC-BC}{2}$$

from the centre towards G; the angular velocity of the sheave is $\omega_1 = \frac{AC + BC}{2}$, and, consequently, the velocity of its centre is

$$\nu = \frac{FG}{2}$$

or the mean between the velocities of the two vertical parts of the cord.

If the cord be fixed to the framework at the point B, instead of being wound on a barrel, the velocity of point C is

$$\omega_1 = \frac{AC + BC}{2}$$

A case-containing several sheaves is called a block. A fall-block is attached to a fixed cord; a running-block is movable to and from a fall-block, with which it is connected by two or more plies of a rope. The whole combination is called a block or pulley. (See PULLEYS for practical applications of these principles.)

§ 74. Differential Screw.—On the same axis let there be two screws of the respective pitches $p_1$ and $p_2$, made in one piece, and rotating with the angular velocity $\omega_1$. Let this piece be called $C$. Let the first screw turn in a fixed nut $C$, and the second in a sliding nut A. The velocity of advance of B relative to C is (according to § 32) $p_1 \omega_1$, and of A relatively to B (according to § 57) $-p_2 \omega_1$; hence the velocity of A relatively to C is

$$\omega_1 = \frac{p_1}{p_2}$$

being the same with the velocity of advance of a screw of the pitch $p_1 - p_2$. This combination, called Hunter's or the differential screw, combines the strength of a large thread with the slowness of motion due to a small one.

§ 75. Epicyclic Trains.—The term epicyclic train is used by Willis to denote a train of wheels carried by an arm, and having certain rotations relatively to that arm, in straight guides along the line either driven by the wheels or assist in driving them. The comparative motions of the wheels and of the arm, and the aggregate paths traced by points on the wheels, are determined by the principles of the composition of rotations, and of the description of rolling curves, explained in §§ 30, 31.

§ 76. Link Motion.—A slide valve operated by a link motion receives an aggregate motion from the mechanism driving it. (See STEAM-ENGINE for a description of this and other types of mechanism of this class.)

§ 77. Parallel Motions.—A parallel motion is a combination of turning pieces in mechanism designed to guide the motion of a corresponding piece from the direct path of a single piece either exactly or approximately in a straight line, so as to avoid the friction which arises from the use of straight guides for that purpose. Fig. 113 represents an exact parallel motion, first proposed, it is believed, by Scott Russell. The arm CD turns on the axis C, and is connected by the device D to the middle of the bar ADB, whose length is double of that of CD, and one of whose ends B is jointed to a slider, sliding in a straight guide along the line CB. Draw BE perpendicular to CB, cutting CD produced in E, then the straight line AC. While the stroke of A is AC, extending to equal distances on either side of C, and equal to twice the chord of the arc DD, the stroke of B is only equal to twice the sagitta; and thus A is guided through a comparatively long stroke by the sliding of B through a comparatively short stroke, and by rotatory motions at the joints C, D, B.

§ 78.* An example of an approximate straight-line motion composed of three bars fixed to a frame is shown in fig. 114. It is due to P. L. Tchebichev of St Petersburg. The links AB and CD are equal in length and are centred respectively at A and C. The ends D and B are joined by a link the respective lengths are in the proportions $AC:CD = 1:1:3:3:4$ the middle point E of DB will describe an approximately straight line parallel to AC within limits of length about equal to AC. C. N. Peaucellier, a French engineer officer, was the first, in 1864, to invent a linkwork with which an exact straight line could be drawn. The linkwork is shewn in fig. 115, from which it is seen that a rhombus of four equal bars ABCD, joined at opposite corners with two equal bars BE and DE. The seventh link AF is equal in length to half the distance EA when the mechanism is in its central position. The points E and F are fixed. It can be proved that the point C always moves in a straight line at right angles to the line EF. The more general property of the mechanism correspond to proportions between the lengths FA and EF other than that of equality is that the curve described by the point C is the inverse of the curve described by A. There are other arrangements of bars giving straight-line motions, and these arrangements together with the general properties of mechanisms of this kind are discussed in How to draw a Straight Line by H. Kempe (London 1876).

§ 79.* The Pantograph.—If a parallelogram of links (fig. 116), be fixed at any one point a in any one of the links produced in either direction, and if any straight line be drawn from a, the points D and E will be in a straight line for all positions of the mechanism, and if the point b is guided in any curve whatever, the point c will trace a similar curve, but in the ratio ab : ac.

This property of the parallelogram is utilized in the construction of the pantograph, an instrument used for obtaining a copy of a map or drawing on a different scale. The motion of one piece is said to be completely constrained relatively to the other piece. Again, the pieces A and B (fig. 117) are paired together as a slide, and the only relative motion possible between them is that of sliding, and therefore the motion of one relatively to the other is completely constrained. The pieces may be paired
MECHANICS

Fig. 118.

Fig. 119.

Fig. 120.

Fig. 121.

Fig. 122.

pairs which have surface contact are classified as lower pairs. Kinematic pairs in which contact takes place along a line only are classified as higher pairs. A pair of spur wheels in gear is an example of a higher pair, because the wheels have contact between their teeth along lines only.

A kinematic link of the simplest form is made by joining up the halves of two kinematic pairs by means of a rigid link. Thus if $A_1B_1$ be the turning pair and $A_2B_2$ a second turning pair, the rigid link formed by joining $B_1$ to $B_2$ is a kinematic link. Four links of this kind are shown in fig. 120 joined up to form a closed kinematic chain.

In order that a kinematic chain may be made the basis of a mechanism, every point in any link of it must be completely constrained with regard to every other link.

Thus in fig. 120 the motion of a point $a$ in the link $A_1A_2$ is completely constrained with regard to the link $B_1B_2$ by the turning pair $A_1$ and $B_1$, and it can be proved that the motion of $a$ relative to the non-adjacent link $A_2A_3$ is completely constrained, and therefore the four-bar chain, as it is called, can be and is used as the basis of many mechanisms. Another way of considering the question of constraint is to imagine any one link of the chain fixed; then, however the chain is moved, the path of a point, as $a$, will always remain the same. In a five-bar chain, if $a$ is a point in a link non-adjacent to a fixed link, its path is indeterminate. Still another way of stating the matter is to say that if any one link of the chain is fixed and be fixed, any point in the chain must have only one degree of freedom. In a five-bar chain a point, as $a$, in a link non-adjacent to the fixed link has two degrees of freedom and the chain cannot therefore be used for a mechanism. These principles may be applied to examine any possible combination of links forming a kinematic chain in order to test its suitability for use as a mechanism. Compound chains are formed by the super-position of two or more simple chains, and in these more complex chains links will be found carrying three, or even more, halves of kinematic pairs. The Joy valve gear mechanism is a good example of a compound kinematic chain.

A chain built up of three turning pairs and one sliding pair, known as the slider crank chain, is shown in fig. 121. It will be seen that the piece $A_1$ can only slide relatively to the piece $B_1$, and these two pieces therefore form the sliding pair. The piece $A_1$ carries the pin $B_1$, which is one half of the turning pair $B_1B_2$. The piece $A_2$ together with the pin $B_4$ therefore form a kinematic link $A_2B_4$. The other links of the chain are $B_2A_2$, $B_3A_3$. In order to convert a chain into a mechanism it is necessary to fix one link in it. Any one of the links may be fixed. It follows therefore that there are as many possible mechanisms as there are links in the chain. For example, there is a well-known mechanism corresponding to the fixing of three of the four links of the slider crank chain (fig. 122). If the link $d$ is fixed the chain at once becomes the mechanism of the ordinary steam engine; if the link $e$ is fixed the mechanism obtained is that of the oscillating cylinder steam engine; if the link $c$ is fixed the mechanism becomes either the Whitworth quick-return motion or the slot-bar motion, depending upon the proportions between the lengths of the links $c$ and $e$. These different mechanisms are called

inversions of the slider crank chain. What was the fixed framework of the mechanism in one case becomes a moving link in an inversion.

The Reuleaux system, therefore, consists essentially of the analysis of every mechanism into a kinematic chain, and since each link of the chain may be the fixed frame of a mechanism quite diverse mechanisms are found to be merely inversions of the same kinematic chain. The Reuleaux’s Kinematics of Machinery, translated by Sir A. B. W. Kennedy (London, 1876), is the book in which this system is set forth in all its completeness. In Mechanics of Machinery, by Sir A. B. W. Kennedy (London, 1886), the system was used for the first time in an English textbook, and now it has found its way into most modern textbooks relating to the subject of mechanism.

§ 81. Centres of Rotation. Centres, Instantaneous Centres, Velocity, Image. Diagram. — Problems concerning the relative motion of the several parts of a kinematic chain lead naturally to a consideration of the way hitherto used in this article and based on the principle of § 34. The first is by the method of instantaneous centres, already exemplified in § 65, and rolling centroids, developed by Reuleaux in connection with his proofs of the curvedads of Professor R. H. Smith’s method already referred to in § 23.

Method 1.—By reference to § 30 it will be seen that the motion of a cylinder rolling on a fixed cylinder is one of rotation about an instantaneous axis $l$, and that the velocity both as regards direction and magnitude is the same as if the rolling piece $B$ were for the instant turning about a fixed axis coincident with the instantaneous axis. If the rolling cylinder $B$ and its path $A$ now are assumed to receive a common plane motion, what was the character of the point $P$ becomes the velocity of $P$ relative to the cylinder $A$, since the motion of $B$ relatively to $A$ still takes place about the instantaneous axis $O$. If $B$ stops rolling, then the cylinders continue to move as though they were parts of a rigid body, and notice that the shape of either rolling curve (fig. 91 or 92) may be found by considering each fixed in turn and then tracing out the locus of the instantaneous axis. These rolling cylinders are sometimes called axoids, and a section of an axoid in a plane parallel to the plane of motion is called a centrode. The axoid is hence the locus of the instantaneous axis, whilst the centrode is the locus of the instantaneous centre in any plane parallel to the plane of motion. There is no restriction on the shape of the centrode, so long as there is any shape consistent with rolling (that is, no slipping is permitted), and the relative velocity of a point $P$ is still found by considering it with regard to the instantaneous centre. The centrode shows the relative motion of any pair of non-adjacent links of a kinematic chain is determined by the rolling together of two ideal circular surfaces (cylindrical being used here in the general sense), each of which may be assumed to be formed by the extension of the material of the link to which it corresponds. These surfaces have contact at the instantaneous axis, which is now called the instantaneous axis of the two links concerned. To find the form of these surfaces corresponding to a particular pair of non-adjacent links, consider each of these links as being in turn the fixed link, and then the locus of the instantaneous axis is the axode corresponding to the fixed link, or, considering a plane of motion only, the locus of the instantaneous centre is the centrode corresponding to the fixed link.

To find the instantaneous centre for a particular link corresponding to any given configuration of the kinematic chain, it is only necessary to know the direction of motion of any three points in the link, since through these points respectively at right angles to their directions of motion intersect in the instantaneous centre.

To illustrate this principle, consider the four-bar chain shown in fig. 122 made up of the four links $a, b, c, d$, let $a$ be the fixed link, and consider the link $c$. Its extremities are moving respectively in directions at right angles to the links $b$ and $d$; hence produce the links $b$ and $d$ to meet in the point $O$. This point is the instantaneous centre of the motion of the link $c$ relatively to the fixed link $a$, a fact indicated by the suffix $ac$ placed after the letter $O$. The process is repeated for different values of the angle $\theta$ the curve through the several points $O_{ac}$ which might be imagined as formed by an extension of the line $O_{ac}$ as far as the desired point. The method is analogous to measuring the normals to the cylinder at a certain point $O_{ac}$ the axis $b$ and $d$ can be found as before. The axis about which a pair of adjacent links turn is a permanent axis, and is of course the axis

[THEORY OF MACHINES]
of the pin which forms the point. Adding the centres corresponding to these several axes to the figure, it will be seen that there are six centres in connexion with the four-bar chain of which four are permanent and two are instantaneous or virtual centres; and, further, that motion may be made up of the configuration of the chain these centres govern themselves into three sets of three, each set lying on a straight line. This peculiarity is not an accident or a special property of the four-bar chain, but is an illustration of a general law regarding the subject discussed by Gillet. A. A. Mechanics, p. 142 quoted above. Having obtained the set of instantaneous centres for a chain, suppose a is the nearest point to the chain and c any other point; then Oa is the instantaneous centre of the two links and may be considered for the instant as the trace of an axis fixed to an extension of the link a about which e is turning, and thus problems of instantaneous velocity concerning the links are solved as though the link e were merely rotating for the instant about a fixed axis coincident with the instantaneous axis.

Method 2.—The second method is based upon the vector representation of velocity. In this diagram, the vector of the velocity of the point B having given the vector of the point C. The principle upon which questions regarding acceleration. That is to say, although the instantaneous centre is a centre of no velocity for the instant, it is not a centre of no acceleration, and in fact the centre of no acceleration is in general a quite different point. The general principle lies in the fact that if a vector CB (fig. 125) have plane motion and the acceleration of any point C be given in magnitude and direction, the acceleration of any point e must be given upon the diagram, and the acceleration of C, the acceleration of B about C and the tangential acceleration of B about C. Let A be any origin, and let Ac represent the acceleration of the point C, at the radial acceleration of B about C which must be directed parallel to BC, and tb the tangential acceleration of B about C which must of course be at right angles to tb; then the vector sum of these three magnitudes is Ab, and this vector represents the acceleration of the point B. The directions of the radial and tangential accelerations of the point B are always known when the position of the point is assigned, since these are to be drawn respectively parallel to and at right angles to the link itself. The magnitude of that point of the acceleration vector p/Bc, v being the velocity of the point B about the point C. This velocity can always be found from the velocity diagram of the chain of which the link forms a part. If dw/dt is the angular acceleration of the point C, and the several members of C and B can be drawn. The direction of tb, the third vector in the diagram, is also known, so that the problem is reduced to the condition that b is somewhere on the line tb. Then other conditions consequent upon the fact that the link A is a rigid body can be ensured to enable b to be fixed. These methods are set forth and exemplified in "Mechanics," by J. H. Smith (London, 1886). Examples, completely worked out, of velocity and acceleration diagrams for the slider crank, which clearly illustrate the principle of the mechanism of the lever are found in ch. vi. of "Valves and Valve Gear Mechanism," by W. E. Dalby (London, 1906).

Chapter II. On Applied Dynamics

§ 83. Laws of Motion.—The action of a machine in transmitting force and motion simultaneously, or performing work, is governed, in common with the phenomena of moving bodies in general, by two "laws of motion."

Division 1. Balanced Forces in Machines of Uniform Velocity.

§ 84. Application of Force to Mechanism.—Forces are applied in units of weight; and the unit most commonly employed in Britain is the pound avoirdupois. The action of a force applied to a body must be considered as having some definite space, either a volume of three dimensions or a surface of two. An example of a force distributed throughout a volume is the weight of the body itself, which acts on every particle, however small. The pressure exerted between two bodies at their surface of contact, or between the surface of one body and the bottom of a vessel, or the like, is an example of a force distributed over a surface. The mode of distribution of a force applied to a solid body requires to be considered when its stiffness and strength are treated of; but, in questions respecting the action of a force upon a rigid body considered as a whole, the resultant of the distributed force, determined according to the principles of statics, and considered as acting in a single line and applied at a single point, may, for the occasion, be substituted for the force itself. When the forces are applied, for example, in a machine is treated as acting wholly at its centre of gravity, and each pressure applied to it as acting at a point called the centre of pressure of the surface to which the pressure is really applied.

§ 85. Forces applied to Mechanism Classed.—If θ be the obliquity of a force F applied to a piece of a mechanism—that is, the angle made by the direction of the force with the direction of motion of its point of application—then by the principles of statics, F may be resolved into two rectangular components, viz.:—

\[ P = F \cos \theta \]
\[ Q = F \sin \theta \]

Along the direction of motion, \( P = F \cos \theta \)
Across the direction of motion, \( Q = F \sin \theta \)
If the component along the direction of motion acts with the motion, it is called an effort; it against the motion, a resistance. The component across the direction of motion is a lateral pressure; the unbalanced lateral pressure on any piece, or part of a piece, is deflecting force. A lateral pressure may increase resistance by deflecting friction; the friction so caused acts against the motion, and is a resistance, but the lateral pressure causing it is not a resistance. Resistances are distinguished into useful and prejudicial, according as they arise from the useful effect produced by the machine or from other causes.

§ 86. Work.—Work consists in moving against resistance. The work is said to be performed, and the resistance overcome. Work is measured by the distance through which its point of application is moved. The unit of work commonly used in Britain is a resistance of one pound weight through a distance of one foot, and is called a foot-pound.

When two different points of application of the same magnitude of work, and in the same direction, are performed, the work is the sum of the work done at each point, as is performed by any machine or in overcoming prejudicial resistance.

§ 57: Energy: Potential Energy.—Energy means capacity for performing work. The energy of an effort, or potential energy, is measured by the product of the effort into the distance through which its point of application is capable of being moved. The unit of energy is the same with the unit of work.

When the point of application of an effort has been moved through a given distance, energy is said to have been exerted to an amount expressed by the product of the effort into the distance through which its point of application has been moved.

§ 88. Variable Effort and Resistance.—If an effort has different magnitudes and motion different ppoint of its point of application through a given distance, let each different magnitude of the effort P be multiplied by the length $\Delta s$ of the corresponding portion of the point of the point of application; the sum

$$ P\Delta s $$

is the whole energy exerted. If the effort varies by insensible gradations, the energy exerted is the integral or limit towards which that sum approaches continually as the divisions of the path are made smaller and more numerous, and is expressed by

$$ \int P\Delta s $$

Similar processes are applicable to the finding of the work performed in overcoming a varying resistance.

The work done by a machine can be actually measured by means of a dynamometer (a dynamometer).

§ 89. Principle of the Equality of Energy and Work.—From the first law of motion it follows that in a machine whose pieces move with uniform velocities the efforts and resistances must balance each other in magnitude. The principle of statics is known, that in order that a system of forces applied to a system of connected points may be in equilibrium, it is necessary that the sum formed by putting together the products of the forces by the respective distances through which they are applied be equal to the sum of all products of weights moving in an opposite direction, each along the direction of the force applied to it, shall be zero, products being considered positive or negative according as the direction of the force and the positive motions of their points of application are alike or opposite.

In other words, the sum of the negative products is equal to the sum of the positive products. This principle, applied to a machine whose parts move with uniform velocities, is equivalent to saying that if at any given interval of time the energy exerted is equal to the work performed.

The symbolical expression of this law is as follows: let efforts be applied to one or any number of points of a machine; let any one of these efforts be represented by $P$, and the distance traversed by its point of application in a given interval of time by $ds'$; let resistances be overcome at one or any number of points of the same machine; let any one of these resistances be denoted by $R$, and the distance traversed by its point of application in the $s''$ of the time interval by $ds$; then

$$ \Sigma Pds = \Sigma Rs $$

The lengths $ds, ds'$ are proportional to the velocities of the points to which they are applied, and the proportions of these velocities to other are deducible from the action of the machine by the principles of pure mechanism explained in Chapter I.

§ 90. Static Equilibrium of Mechanisms.—The principle stated in the preceding section, namely, that the energy exerted is equal to the work done, enables to compute the forces acting in the respective directions of motion at two points of a mechanism, one being the point of application of the effort, and the other the point of application of the resistance, to be readily found. This principle is expressed by the equation:

$$ \Sigma Pds = \Sigma Rs $$

where $s$ is the point to which two or more efforts are applied, and $d$ is the point of application of a resistance, and $ds$ and $ds'$ are the distances through which the respective small displacements $ds$ and $ds'$ were made, it becomes $Pds = Rds'$, that is, $P = \frac{Rds'}{ds}$, which shows that the force ratio is the inverse of the velocity ratio. It follows at once that any method which may be available for the determination of the velocity ratio is equally available for the determination of the force ratio, being clearly understood that the forces involved are the components of the actual forces resolved in the direction of motion of the points. The relation between the effort and the resistance may be found by means of this principle for all kinds of mechanisms, when the friction produced by the components of the forces across the direction of motion of the two points is neglected. Consider the following example:

A four-bar chain having the configuration shown in fig. 126 supports a load $P$ at the point $x$. What load is required at the point $y$ to maintain the configuration shown?

Let the instantaneous centre of $O_{A}$ and $O_{D}$ be connected by the line through the respective directions of motion of the points $x$ and $y$; then there are obtained the components $P \cos \theta$ and $R \cos \phi$. Let the machine have a small motion; then, for the instant, the line $s$ is turning about its instantaneous centre $O_{B}$, and, if $w$ is its angular velocity, the velocity of the point $x$ is $w$, and the velocity of the point $y$ is $w$. Hence, from the principle just stated, $P \cos \theta = R \cos \phi \times w$. But, $P$ and $R$ being respectively the perpendiculars to the lines of action of the forces, this equation reduces to $P = R$, which shows that the ratio of the two forces may be found by taking moments about the instantaneous centre of the link on which they act.

The forces $P$ and $R$ may, however, act on different links. The general problem may be thus stated: Given a mechanism of which $r$ is the fixed link, and $s$ and $t$ any other two links, given also a force $f_{s}$ acting on the link $s$, to find the force $f_{t}$ acting in a given direction on the link $t$, which will keep the mechanism in static balance. The graphic solution of this problem may be effected thus:

1. Find the three virtual centres $O_{B}$, $O_{C}$, $O_{D}$, which must be three points in a line.
2. Resolve $f_{s}$ into two components, one of which, namely, $f_{s}$, passes through $O_{B}$, and may be neglected, and the other $f_{t}$ passes through $O_{C}$.
3. Find the point $M$, where $f_{s}$ joins the given direction of $f_{t}$, and resolve into two components, of which one is in the direction of $O_{D}$, and the other is in the given direction of $f_{t}$; and therefore the force required.

This statement of the problem and the solution is due to Sir A. B. Kennelly and given in ch. 8 of his Mechanics of Machinery. Another general solution of the problem is given in the Proc. Lond. Math. Soc. (1875-1876), by the same author. An example of the method of solution stated above, and taken from the Mechanics of Machinery, is illustrated by the mechanism fig. 127, which is an epicurean train of three wheels with the first wheel $s$ fixed. Let it be required to find the vertical force $f_{s}$ which must act at the pitch radius of the last wheel $t$ to balance exactly a force $f_{t}$ acting vertically downwards at the arm at the point indicated in the figure. The two links concerned are the last wheel $t$ and $s$, and the centre $O_{D}$ being the fixed link of the mechanism.

The virtual centres $O_{B}$, $O_{C}$, $O_{D}$ are at the respective axes of the wheels $s$ and $t$, and the centre $O_{D}$ divides the line through these two points externally in the ratio of the train of wheels. The figure sufficiently indicates the various steps of the solution.

The relation between the effort and the resistance in a machine to include the effect of friction at the joints has been investigated in a paper by Professor Fleeming Jenkin, "On the application of graphic methods to the determination of the efficiency of machinery."
MECHANICS

(Trans. Roy. Soc. Ed., vol. 28.) It is shown that a machine may at any instant be represented by a frame of links the stresses in which are identical with the pressures at the joints of the mechanism. This self-strained frame is called the dynamic frame of the machine. The calculation of the forces is given to the reader by means of lines called the dynamic frame, and when the frame with its elastic links is drawn the stresses in the several members of it may be determined by means of reciprocal figures. Incidentally the method gives the expression of the work done by the machine.

§ 91. Efficiency.—The efficiency of a machine is the ratio of the useful work to the total work—that is to say, the energy exerted—and is represented by

$$\eta = \frac{\sum R_{d} s}{\sum R_{d} s + \sum R_{p} s}$$

($$R_{d}$$ being taken to represent useful and $$R_{p}$$ prejudicial resistances. The reason this efficiency of a machine approaches to unity is the better the machine.

§ 92. Power and Effect.—The power of a machine is the energy exerted, and the effect the useful work performed, in some interval of time of definite length, such as a second, an hour, or a day.

The unit of power, called conventionally a horse-power, is 550 foot-pounds per second, or 33,000 foot-pounds per minute, or 1,900,000 foot-pounds per hour.

§ 93. Modulus of a Machine.—In the investigation of the properties of a machine, the useful resistances to be overcome and the useful work to be performed are usually given. The prejudicial resistances are generally functions of the weights of the parts of the machine, and having been determined, serve for the computation of the lost work, which, being added to the useful work, gives the expenditure of energy required. The result of this investigation, expressed in the manner of this energy and useful work, is called by Moseley the modulus of the machine. The general form of the modulus may be expressed thus—

$$E = U + (U, A) + \psi(A),$$

where $$A$$ denotes some quantity or set of quantities depending on the form, arrangement, weight and other properties of the mechanism. Moseley has pointed out that in most cases this equation takes the much simpler form of

$$E = (1 + A)U + B,$$

where $$B$$ and $$A$$ are constants, depending on the form, arrangement and weight of the mechanism. The efficiency corresponding to the last equation is

$$\eta = \frac{U + A}{U + B}$$

§ 94. Trains of Mechanism.—In applying the preceding principles to a train of mechanism, it may either be treated as a whole, or it may be considered in sections consisting of single pieces, or of any convenient portion of the train—each section being treated as a machine, and the mechanism of the train being considered as a couple of forces acting it, and of the angular velocity. The ordinary British unit of moment is a foot-pound; but it is to be remembered that this is a foot-pound of a sort from the unit of energy and work.

If a force be applied to a turning piece in a line not passing through its axis, the axis will press against its bearings with an equal and parallel force, and the equal and opposite reaction of the bearings will constitute, together with the first-mentioned force, a couple of forces acting in the plane of the axis and its plane of the line of action of the first force.

A couple is said to be right or left handed with reference to the observer, according to the direction in which it tends to turn the body upon which it is applied, according as its tendency is with or against that of the actual rotation.

Let $$dt$$ be an interval of time, $$a$$ the angular velocity of the piece; then $$adt$$ is the angle through which it turns in the interval $$dt$$, and $$aw$$ is the distance travelled in the point of application of the force moves. Let $$P$$ represent an effort, so that if $$P$$ is a driving couple, then

$$P = Pdt = Prad = Mat$$

(57) is the energy exerted by the couple $$M$$ in the interval $$dt$$; and a similar equation gives the work performed in overcoming a resisting couple. When several couples act on one piece, the resultant of their moments is to be multiplied by the common angular velocity of the whole piece.

§ 95. Reduction of Forces to a given Point, and of Couples to the Axis of a given Piece.—In computing resistances machines it is often convenient to substitute for a force applied to a given point, or a couple applied to a given piece, the equivalent force or couple applied to some other point or piece; that is to say, the force or couple, which, if applied to the other point or piece, would exert equal energy or employ equal work. The principles of this reduction are that the ratio of the given to the equivalent force is the reciprocal of the ratio of the velocities of their points of application, and that the ratio of the given to the equivalent couple is the reciprocal of the ratio of the angular velocities of the pieces to which they are applied.

These velocity ratios are known by the construction of the mechanism, and are independent of the absolute speed.

§ 96. Balanced Lattices and annuities.—The most important part of the lateral pressure on a piece of mechanism is the reaction of its guides, if it is a sliding piece, or of the bearings of its axis, if it is a turning piece; and the balanced portion of this reaction is that part of it which is represented by the forces applied to the piece, its own weight included. There may be or may not be an unbalanced component in this pressure, due to the deviated motion. Its laws will be considered in the sequel.

§ 97. Friction.—The most important kind of resistance in machines is the friction or rubbing resistance of surfaces which slide over each other. The direction of the resistance of friction is opposite to that in which the sliding takes place, its magnitude is the product of the normal pressure or force which presses the rubbing surfaces together in a direction perpendicular to themselves into a specific constant already mentioned in § 14, as the coefficient of friction, which depends on the nature and condition of the surfaces in contact and on the fluid with which they are covered. The total pressure exerted between the rubbing surfaces is the resultant of the normal pressure and of the friction, and its obliquity, or inclination to the common perpendicular of the surfaces, is the angle of friction, whose tangent is the coefficient of friction. Thus, let $$N$$ be the normal pressure, $$R$$ the friction, $$f$$ the total pressure, $$\theta$$ the angle of friction, and $$\phi$$ the angle of repose; then

$$f = \tan \phi \{ R = N \tan \theta = \tan \theta \}$$

(58)

Experiments on friction have been made by Coulomb, Samuel Vince, John Rennie, James Wood, D. Rankine and others. The most complete and elaborate experiments are those of Morin, published in his Notions de mécanique, and republished in Britain in the works of Moseley and Gordon.

The experiments of Beauchamp Tower ("Report of Friction Experiments," Proc. Inst. Mech. Eng., 1883) showed that when oil is used to a journey of means of an oil lubrication, the coefficient of friction varies nearly inversely as the load on the bearing, thus making the product of the load on the bearing and the coefficient of friction a constant. Mr. Tower's experiments were carried out by the constant temperature of the oil, the coefficient of Friction of friction being the sum or integral of the moments of friction of their several portions.

When the relative motion of the rubbing surfaces is one of rotation, the work of friction in a unit of time, for a portion of the rubbing surfaces at a given distance from the axis of rotation, may be found by multiplying together the friction of that portion, its distance from the axis, and the angular velocity. The product of the force of friction by the distance at which it acts from the axis of rotation is called the moment of friction. The total moment of friction of a machine is the sum integral of the moments of friction of its several portions.

To express this symbolically, let $$du$$ represent the area of a portion of a pair of rubbing surfaces at a distance $$r$$ from the axis of their rotation; $$f$$ be the coefficient of energy in the area, and $$br$$ the moment of area; and $$f$$ the coefficient of friction. Then the moment of friction of the portion

$$du = fbr$$

(59) is the total moment of friction of the portion; and the work performed in a unit of time by overcoming friction when the area is $$du$$ is

$$fbr$$

It is evident that the moment of friction, and the work lost by being performed in overcoming friction, are less in a rotating piece as the bearings are of smaller radius. But a limit is put to the reduction of friction by the nature of the rubbing surfaces and the condition of the lubrication, as well as by the conditions of strength and stiffness.

§ 100. Total Pressure between Journal and Bearing.—A single piece, rotating with a given angular velocity, has four mutually balanced forces applied to it: (1) the effort exerted on it by the piece which drives it; (2) the resistance of the piece which follows it—may be considered for the purposes of the present question as useful resistance; (3) its weight; and (4) the reaction of its own cylindrical bearings. There are given the following data—
The direction of the effort.
The direction of the useful resistance.
The weight of the piece and the direction in which it acts.
The magnitude of the useful resistance.
The radius of the bearing, \(r\).
The angle of repose, \(\phi\), corresponding to the friction of the journal on the bearing.
And there are the required following:

- The direction of the reaction on the bearing.
The magnitude of that reaction.
The magnitude of the effort.

Let the useful resistance and the weight of the piece be compounded by the principles of statics into one force, and let this be called the given force.

The directions of the effort and of the given force are either parallel or meet in a point. If they are parallel, the direction of the reaction of the bearing is also parallel to them; if they meet in a point, the direction of the reaction traverses the same point.

Also, let AAA, fig. 128, be a section of the bearing, and C its axis; then the direction of the reaction, at the point where it intersects the circle AAA, must make the angle \(\phi\) with the radius of that circle; that is to say, it must be parallel to PT touching the smaller circle BB, whose radius is \(r\), sin \(\phi\).

The side on which it touches that circle is determined by the fact that the obliquity of the reaction is such as to oppose the rotation.

Thus it is determined the direction of the reaction of the bearing; and the magnitude of that reaction and of the effort are then found by the principles of the equilibrium of three forces already stated in \(\S\) 79.

The work lost in overcoming the friction of the bearing is the same as that which would be performed in overcoming at the circumference of the small circle \(BB\) a resistance equal to the whole pressure between the journal and bearing.

In order to diminish that pressure to the smallest possible amount, the effort, and the resultant of the useful resistance, and the weight of the piece (called above the “given force”) ought to be opposed to each other as directly as is practicable consistent with the purposes of the machine.

An investigation of the forces acting on a bearing and journal lubricated by an oil bath will be found in a paper by Osborne Reynolds in the *Phil. Trans.*, p. 1 (1886). (See also Bearings.)

\(\S\) 101. Friction of Pins and Collars.—Let there be a shaft upon which a force is acting at a point, which is not coincident with the axis of the shaft; the direction of the reaction this force has upon the shaft will be determined by the friction of the bearing in the pivot, which is a friction of one point in a surface.

Now, \(\phi\) is the frictional angle, and \(r\) is the radius of the pivot; the work accomplished by the friction of the bearing is the product of the frictional angle and its radius, and this is the only force acting on the pivot that does not meet in its direction with the direction of the force acting on the pivot.

\(\Sigma\) 102. Friction of Teeth.—Let \(N\) be the normal pressure exerted between a pair of teeth of a pinion and gear; \(r\) the total distance through which they slide upon each other; \(n\) the number of pairs of teeth which pass the plane of axis in a unit of time; then

\[
n' \frac{N}{r} \sin \theta
\]

is the work lost in unit of time by the friction of the teeth. The sliding \(s\) is composed of two parts, which take place during the approach and recess respectively. Let \(s_1\), \(s_2\), and \(r_1\), \(r_2\) be those quantities.

\(\sin \theta\) is the velocity of sliding at any instant has been given, viz. \(u = c (a_1 + a_2)\), where \(u\) is that velocity, \(c\) the distance \(T\) at any instant from the point of contact of the teeth with the pitch-circle, and \(a_1, a_2\) the respective angular velocities of the wheels.

Let \(v\) be the common velocity of the two pitch-circles, \(r_1, r_2\), their radii; then the above equation becomes

\[
\frac{1}{r_1} + \frac{1}{r_2} = \frac{1}{r}
\]

To apply this to involute teeth, let \(c\) be the length of the approach, \(s_1\) the length of the recess, \(u_1\) the mean velocity of sliding during the approach, \(u_2\) during the recess; then

\[
u_1 = \frac{c (1 + \frac{1}{r_1})}{2 (1 + \frac{1}{r_2})}, \quad u_2 = \frac{c (1 + \frac{1}{r_1})}{2 (1 + \frac{1}{r_2})}
\]

also, let \(\theta\) be the obliquity of the action; then the times occupied by the approach and recess are respectively

\[
\frac{r_2}{r_1} \cos \theta \quad \frac{r_2}{r_1} \cos \theta
\]

giving, finally, for the length of sliding between each pair of teeth,

\[
s = s_1 + s_2 = \frac{c^2 + c^2 (1 + \frac{1}{r_1})}{2 (1 + \frac{1}{r_2})}
\]

which, substituted in equation (63), gives the work lost in a unit of time by the friction of involute teeth. This result, which is exact for involute teeth, is approximately true for teeth of any figure.

Inside gearing, if \(r_1\) be the less radius and \(r_2\) the greater,

\[
\frac{1}{r_1} + \frac{1}{r_2} = \frac{1}{r_t}
\]

is to be substituted for \(\frac{1}{r_1} + \frac{1}{r_2}\).

\(\S\) 103. Friction of Cords and Belts.—A flexible band, such as a cord, rope, belt or strap, may be used either to exert an effort or a resistance upon a pulley round which it wraps. In either case the relation of the effort or resistance exerted between the band and the pulley is their mutual friction, caused by and proportional to the normal pressure between them.

Let \(T\) be the tension of the free part of the band at that side towards which the tension tends to draw the pulley, or to from which the pulley tends to draw it; \(T_1\) the tension of the free part at the other side; \(T\) the tension of the band at any intermediate point of its arc of contact with the pulley; \(\theta\) the ratio of the length of that arc to the radius of the pulley; \(d\Phi\) the radius of that infinitely small element of that arc to the radius of the pulley; \(F = T_1 - T_2\) the total friction between the band and the pulley; \(d\Phi\) the elementary portion of that friction due to the elementary arc \(d\Phi\); \(T\) the coefficient of friction between the materials of the band and pulley.

Then, according to a well-known principle in statics, the normal pressure at the elementary arc \(d\Phi\) is \(T d\Phi\), \(T\) being the mean tension of the band at that elementary arc; consequently the friction on that arc is \(d\Phi T d\Phi\). Now that friction is also the difference
between the tensions of the band at the two ends of the elementary arc, or $dF = dF_0 = dF_1$; which equation, being integrated throughout the entire arc of contact, gives the following formulæ:

$$T_1 = T_2 = \frac{T_0}{\log \frac{T_1}{T_2}} = \frac{T_0}{\log \frac{1}{r}} = \frac{T_0}{\log \frac{1}{r}}$$

When a belt connecting a pair of pulleys has the tensions of its two sides equal, the pulleys being at rest, and when the pulleys are next set in motion, so that one of them drives the other by means of the belt, it is found that the advancing side of the belt is exactly as much tightened as the returning side is slackened, so that the mean tension remains unchanged. Its value is given by this formula—

$$T_1 + T_2 = 2T_0$$

which is useful in determining the original tension required to enable a belt to transmit a given force between two pulleys. The equations 65 and 66 are applicable to a kind of brake called a friction-strap, used to stop or moderate the velocity of machines by being tightened round a pulley. The strap is usually of iron, and the pulley of hard wood.

Let $a$ denote the arc of contact expressed in terms of fractions of a turn; then

$$\theta = 6.2832a$$

where $\theta$ is the angle in radians whose common logarithm is $2.7288fa$.

See also Dynamometer for illustrations of the use of what are essentially friction-straits of different forms for the measurement of the brake horse-power of an engine or motor.

§ 104. Stiffness of Ropes.—Ropes offer a resistance to being bent, and, when bent, to being straightened again, which arises from the mutual friction of their fibres. It increases with the sectional area of the rope, and is inversely proportional to the radius of the curve into which it is bent.

The work lost in pulling a given length of rope over a pulley is found by multiplying the length of the rope in feet by its stiffness in pounds. The stiffness is defined as the excess of the tension at the leading side of the rope above that at the following side, which is necessary to bend it into a curve fitting the pulley, and then to straighten it again.

The following empirical formulae for the stiffness of hempen ropes have been deduced by Morin from the experiments of Coulomb:

Let $F$ be the stiffness in pounds avoidopus; $d$ the diameter of the rope in inches, $n = 48^2$ for white ropes and $35^2$ for tarred ropes; $r$ the radius of the pulley in inches; $T$ the tension in pounds.

Then for white ropes, $F = \frac{r}{d^2} 
\left[ \begin{array}{l}
0.0002 + 0.000026d - 0.00012T \\
\end{array} \right]$

for tarred ropes, $F = \frac{r}{d^2} 
\left[ \begin{array}{l}
0.0006 + 0.000139d - 0.00016T \\
\end{array} \right]$

§ 105. Friction-Couplings.—Friction is useful as a means of communicating motion where sudden changes either of force or velocity take place, because, being limited in amount, it may be so adjusted as to limit the forces which strain the pieces of the mechanism with which it comes in contact. Among the contrivances for effecting this object are friction-cones. A rotating shaft carries upon a cylindrical portion of its figure a wheel or pulley turning loosely on it, and consequently capable of remaining at rest when the shaft is in motion. The wheel is in reality an annulus, and has for its purpose a small frustum of a hollow cone. At a small distance from the pulley the shaft carries a small frustum of a solid cone accurately turned to fit the hollow cone. This frustum is made always to turn along with the shaft, so that friction always goes along with the shaft; but when the shafts are disengaged, the pulley is free to turn still. The angle made by the sides of the cone with the axis should not be less than the angle of repose. In the friction-clutch, a pulley loose on the shaft, or made of hoop or gland made to embrace it more or less tightly by means of a screw; this hoop has short projecting arms or ears. A fork or clutch rotates along with the shaft, and is capable of being moved longitudinally by a handle. When the clutch is moved towards the hoop, its arms catch those of the hoop, and cause the hoop to rotate concomitantly with the frictional resistance by friction. There are many other contrivances of the same class, but the two just mentioned may serve for examples.

§ 106. Heat of Friction: Unguents.—The work lost in friction is employed in heating the solid bodies with which it comes in contact. This has been observed in a remote period, but the exact determination of the proportion of the work lost to the heat produced, and the experimental proof that that proportion is the same under all circumstances and with all materials, solid and liquid, and gasous, are comparatively recent achievements of J. P. Joule. The quantity of work which produces a British unit of heat (or so much heat as elevates the temperature of one pound of pure water, at or near ordinary atmospheric temperatures, by $1^\circ F.$) is 772 foot-pounds. This constant, now designated as “Joule's equivalent,” is the principal experimental datum of the science of thermodynamics. In a recent paper, (Phil. Trans., 1887), by Osborne Reynolds and W. M. Mooney, gives 778 as the mean value of Joule's equivalent through the range of 32° to 212° F. See also the papers of Rowland in the Proc. Amer. Acad. (1879), and Griffiths, Phil. Trans. 1893.)

The heat produced by friction, when moderate in amount, is useful in softening and liquefying thick unguents; but when excessive it is prejudicial, by decomposing the unguents, and sometimes even by softening the metal of the bearings, and raising their temperature so high as to set fire to neighboring combustible matters.

Excessive heating is prevented by a constant and copious supply of a good unguent. The elevation of temperature produced by the friction of a journal is sometimes used as an experimental test of the quality of unguents. For modern methods of forced lubrication see bearings.

§ 107. Rolling Resistance.—By the rolling of two surfaces over each other without sliding a resistance is caused which is called the "rolling friction," but more correctly rolling resistance. It is of the nature of a couple, resisting rotation. Its moment is found by multiplying the normal pressure between the rolling surfaces by an arm, whose length depends on the nature of the rolling surfaces, and the work is lost in a direction of overcoming it is the product of its moment by the angular velocity of the rolling surfaces relatively to each other. The following are approximate values of the arm in decimals of a foot:—

<table>

§ 108. Reciprocating Forces: Stored and Restored Energy.—When a force acts on a machine alternately as an effort and as a resistance, it may be called a reciprocating force. Of this kind is the weight of any piece in the mechanism whose centre of gravity alternately rises and falls; for during the rise of the centre of gravity that weight exerts a resistance, and during the fall it acts as an effort. The resultant effect expressed by the product of the weight by the angular height of its rise; and during the fall of the centre of gravity the weight acts as an effort, and exerts in assisting to perform the work of the mechanism the product of the weight by the angular descent of the piece, and by the sine of the angle in which the piece had previously been employed in lifting it. Thus the amount of energy is not lost, but has its operation deferred; and it is said to be stored when the weight is lifted, and restored when it falls.

In a machine of which the weight is to move with a uniform velocity, if the effort and the resistance be constant, the weight of each piece must be balanced on its axis, so that it may produce lateral pressure only, and not act as a reciprocating force. But if the weight of each piece is alternately used as a couple to overcome the uniformity of speed may still be preserved by so adjusting some moving weight in the mechanism that when the effort is in excess it may be lifted, and so balance and employ the excess of effort, and that when the resistance is in excess it may fall, and so balance and employ the excess of resistance—thus storing the periodical excess of energy and restoring that energy to perform the periodical excess of work.

Other forces besides gravity may be used as reciprocating forces for storing and restoring energy—for example, the elasticity of a spring. In most of the derrive machines commonly called "perpetual motions," of which so many are patented in each year, and which are expected by their inventors to perform work without receiving any energy from external sources, the fundamental fallacy consists in an expectation that some reciprocating force shall restore more energy than it has the means of storing.

Division 2. Deflecting Forces.

§ 109. Deflecting Force for Translation in a Curved Path.—In machinery, deflecting force is supplied by the tenacity of some piece, such as a crank, which guides the deflect body in its curved path. This is called self-balancing or (commonly) self-acting, so employed in performing deflexion, and not in balancing another force.

§ 110. Centrifugal Force of a Rotating Body.—The centrifugal force exerted by a rotating body on its axis of rotation is the same in magnitude as if the mass of the body were concentrated at its centre of gravity, and acts in a plane passing through the axis of rotation and the centre of gravity of the body.

The particles of a rotating body exert centrifugal forces on each other, which strain the body, and tend to tear it asunder, but these forces balance each other. The resultant centrifugal force exerted on the axis of rotation is nothing.1

1 This is a particular case of a more general principle, that the motion of the centre of gravity of a body is not affected by the mutual actions of its parts.
centrifugal force will cause strains, vibration and increased friction, and a tendency of the shafts to jump out of their bearings.

§ 111. Centrifugal Couples of a Rotating Body.—Besides the tendency (if any) of the combined centrifugal forces of the particles of a rotating body to shift the axis of rotation, and therefore to cause the shafts to jump out of their bearings, there is a tendency for the force line of the centrifugal force on the frame of the machine to which the weight belongs. In the particular case where the motion is of the kind known as “simple harmonic” the disturbing force on the frame due to the reciprocating weight is equal to the component of the centrifugal force in the line of stroke due to a weight equal to the reciprocating weight supposed concentrated at the crank pin. Using this principle the method of finding the balance weights to be added to a given reciprocating mass is essentially the same as that for the reciprocating forces on the frame continuously in equilibrium is exactly the same as just explained for a system of revolving weights, because for the purpose of finding the balance weights each reciprocating weight may be supposed attached to the crank pin which operates it, thus forming an equivalent revolving system. The balance weights found as part of the equivalent revolving system when reciprocated by their respective crank pins form the balance weights for the given reciprocating system. These conditions may be exactly realized by a system of weights reciprocated by slotted bars, the crank shaft driving the slotted bars rotating uniformly. In practice reciprocation is usually effected through a connecting rod, as in the reciprocating engine, but the principle is the same. To balance a steam engine it is often sufficiently accurate to consider the motion of the pistons as simple harmonic, and the effect on the framework of the acceleration of the connecting rod may be approximately allowed for by adding an equivalent weight at the crank pin. In practice, the weight of the piston inversely as the centre of gravity of the rod divides the distance between the centre of the head pin and the centre of the crank pin. The moving parts of the engine are then divided into two independent systems, the first, for compensating the reciprocating weights consisting of crank pins, crank arms, &c., attached to and revolving with the crank shaft, and the second system of reciprocating weights consisting of the pistons, cross-heads, &c., supposed to be moving in its line of stroke with simple harmonic motion. The balance weights are to be separately calculated for each system, the one set being added to the crank shaft as revolving weights, and the second set being included with the reciprocating weights and operated on as placed. If the first set of balance weights added in this way to a set of reciprocating weights are sometimes called bob-weights. In the case of locomotives the balance weights required to balance the pistons are added as revolving weights to the crank shaft system; and in fact are generally combined with the weights required to balance the revolving system so as to form one weight, the counterpoise referred to in the preceding section, which is seen between the spokes of the wheels of a locomotive. Although this rule on the balance of the horizontal reciprocating engine is very generally in practice, it allows the pull of the engine on the train to be exerted without the variation due to the reciprocation of the pistons, yet the force balanced horizontally is introduced vertically and appears as a system of pressures on the axle. In practice about the hanger the reciprocating weight is balanced in order to keep this variation of rail pressure within safe limits. The assumption that the pistons of an engine move with simple harmonic motion is increasingly gravitation of the system from the axis of revolution a force acts on the shaft tending to deflect it, and varies as the deflexion and as the square of the speed. If the shaft is therefore to revolve stably, this force must be balanced at any instant by the elastic resistance of the shaft to deflexion. To take a simple case, suppose a shaft,
If the rod of a revolving pendulum be jointed, as in fig. 132, not to a point in the vertical axis, but to the end of a projecting arm AC, the position in which the bob will revolve will be the same as if the rod were jointed to the point AB, where its prolongation cuts the vertical axis.

A revolving pendulum is an essential part of most of the contrivances called governors, for regulating the speed of prime movers, of particular which is the steam engine.

§ 115. General Principles.—In order that the velocity of every piece of a machine may be uniform, it is necessary that the forces acting on each piece should be always exactly balanced. Also, in order that the forces acting on each piece of a machine may be always exactly balanced, it is necessary that the velocity of that piece should be uniform.

An excess of the effort exerted on any piece, above that which is necessary to balance the resistance, is accompanied with acceleration; a deficiency of the effort, with retardation.

When a machine is being started from a state of rest, and brought by degrees up to its proper speed, the effort must be in excess; when it is being retarded for the purpose of stopping it, the resistance must be in excess.

An excess of effort above resistance involves an excess of energy exerted above work performed; that excess of energy is employed in producing acceleration.

An excess of velocity above effort involves an excess of work performed above energy expended; that excess of work is performed by means of the retardation of the machine.

When a machine undergoes alternate acceleration and retardation, so that at certain instants of time, occurring at the end of intervals called periods or cycles, it returns to its original speed, then in each of these periods or cycles the alternate excesses of energy and of work neutralize each other; and at the end of each cycle the principle of the equality of energy and work stated in § 87, with all its consequences, is verified exactly as in the case of machines of uniform speed.

At intermediate instants, however, other principles have also to be taken into account, which are deduced from the second law of motion, as applied to direct derivation, or acceleration and retardation.

§ 116. Energy of Acceleration and Work of Retardation for a Shifting Body.—Let w be the weight of a body which has a motion of translation in any path, and in the course of the interval of time \( \Delta t \) let its velocity be increased at a uniform rate of acceleration from \( v_1 \) to \( v_2 \). The rate of acceleration will be

\[
\frac{dv}{dt} = \text{const} = (v_2 - v_1) / \Delta t;
\]

and to produce this acceleration a uniform effort \( P \) will be required, expressed by

\[
P = w(v_2 - v_1) \Delta t
\]

The product \( w v_2 / g \) of the mass of a body by its velocity is called its momentum; so that the effort required is found by dividing the increase of momentum by the time in which it is produced.

To find the energy which has to be produced and therefore the rate of production of the acceleration from \( v_1 \) to \( v_2 \) it is to be observed that the distance through which the effort \( P \) acts during the acceleration is

\[
\Delta s = (v_2 + v_1) / 2 \Delta t
\]

consequently, the energy of acceleration is

\[
P \Delta s = w(v_2 - v_1) / 2 (v_2^2 - v_1^2) / 2g
\]

being proportional to the increase in the square of the velocity, and independent of the time.

In order to produce a retardation from the greater velocity \( v_2 \) to the less velocity \( v_1 \), it is necessary to apply to the body a resistance connected with the retardation and timed by an equation identical in every respect with equation (71), except by the substitution of a resistance for an effort; and in overcoming that resistance the body performs work to an amount determined by equation (72), putting \( Rd \) for \( P \).

§ 117. Energy Stored and Restored by Deviations of Velocities.—Thus a body alternately accelerated and retarded, so as to be brought back to its original position, is capable of producing work during its retardation exactly equal in amount to the energy exerted upon it during its acceleration; so that that energy may be considered as stored during the acceleration, and restored during the retardation, in a manner analogous to the operation of a spring (§ 108).

Let there be given the mean velocity \( V = (v_2 + v_1) / 2 \), the velocity deviation, the rise and fall of velocity of \( v_2 - v_1 \), and the extreme velocities \( v_1, v_2 \), which that body must, in order to accomplish this, produce in order to restore and amount of energy \( E \). By equation (72) we have

\[
E = w(v_2 - v_1)^2 / 2g
\]

which, being divided by \( V = (v_2 + v_1) / 2 \), gives

\[
E / V = w(v_2 - v_1)^2 / 2g;
\]

and consequently

\[
v_2 - v_1 = \sqrt{2gE / w}
\]
The ratio of this fluctuation to the mean velocity, sometimes called the 
unsteadiness of the motion of the body, is 
\( \frac{\langle v^2 - \bar{v}^2 \rangle}{\bar{v}^2} \). (74)

\( \S 118. \) Actual Energy of a Shifting Body.—The energy which must be exerted on a body of the weight \( w \), to accelerate it from a state of rest up to a given velocity of translation \( v \), and the equal amount of work done by the body is capable of performing by overcoming resistance while retarded from the same velocity of translation \( v \) to a state of rest, is 
\[ \frac{wv^2}{2g}. \] (75)

This is the actual energy of the motion of the body, and is half the quantity which in some treaties is called \( \omega v^2 \).

The energy stored or restored, as the case may be, by the deviations of velocity of a body or a system of bodies, is the amount by which the actual energy is increased or diminished.

\( \S 119. \) Conservation of Energy in Machines.—The following principle, expressing the general law of the action of machines with a velocity uniform or varying, includes the law of the equality of energy and work stated in \( \S 89 \) for machines of uniform speed.

In any given interval during the working of a machine, the energy exerted added to the energy restored is equal to the energy stored added to the work performed.

\( \S 120. \) Actual Energy of Circular Translation—Moment of Inertia.—Let \( P \) be the weight of the body about an axis passing through it, and \( E \) the angular velocity. The actual energy of the revolving body is equal to the potential energy \( EP \) of the body when placed as \( P \) is at rest.

\( \S 121. \) Flywheel.—A flywheel is a rotating piece in a machine, generally shaped like a wheel (that is to say, consisting of a rim with spokes), and suited to store and restore energy by the periodical variations in its angular velocity.

The principles according to which variations of angular velocity store and restore energy are the same as those of \( \S 117 \), only substituting moment of inertia for mass, and angular for linear velocity.

Let \( W \) be the weight of a flywheel, \( R \) its radius of gyration, \( a_2 \) its maximum, \( a_1 \) its minimum, and \( A = \frac{1}{2}(a_2 + a_1) \) its mean angular velocity. Let

\[ S = (a_2 - a_1)/A \]
denote the unsteadiness of the motion of the flywheel; the denominator of this fraction is called the steadiness. Let \( e \) denote the quantity by which the energy exerted in each cycle of the working of the machine is alternately exerted and of the work of the short work of the periodical variations, and which has consequently to be alternately stored by acceleration and restored by retardation of the flywheel.

The value of this periodical excess is—
\[ e = RW^2(a_2^2 - a_1^2)/2g, \] (77)
from which, dividing both sides by \( A^2 \), we obtain the following equations:
\[ e = \left\{ \frac{RW^2(a_2^2 - a_1^2)}{2g} \right\}, \]
\[ RWA^2/2g = Se/2. \] (78)

The latter of these equations may be thus expressed in words: The actual energy due to the rotation of the flywheel, with its mean angular velocity, is equal to one-half of the periodical excess of energy multiplied by the steadiness.

In ordinary machinery \( S \) is about 32; in machinery for fine purposes \( S \) is from 50 to 60; and when great steadiness is required \( S = 100 \) to 150.

The periodical excess \( e \) may arise either from variations in the effort exerted by the prime mover, or from variations in the resistance of the work, or from both these causes combined. But when a flywheel is used, it should be placed in as direct connection as possible with the body of the mechanism where the greatest amount of the periodical excess originates; but when it originates at two or more points, it is best to have a flywheel in connexion with each of these points. For example, in a machine-work, the steam-throwing end and the water-bear of the engine; in ringing a bell, the flywheel on the crank-shaft to store and restore the periodical excess of energy arising from the variations in the effort exerted by the connecting-rod upon the crank; and each of the cutting machines, provided an eccentric centre; and other tools have a flywheel of its own to store and restore energy, so as to enable the very different resistances opposed to those tools at different times to be overcome without too great unsteadiness of motion. For tools performing useful work at intervals, and having only their own friction to overcome during the intermediate intervals, \( e \) should be assumed equal to the whole work performed at each separate operation.

\( \S 122. \) Brakes.—A brake is an apparatus for stopping and diminishing the velocity of a machine by friction, such as the friction-strap already referred to in \( \S 103 \). To find the distance \( s \) through which a brake, exerting the friction \( F \), must run in order to stop a machine having the total actual energy \( E \) at the moment when the brake begins to act, reduce, by the principles of \( \S 96 \), the various efforts and other resistances of the machine which act at the same time with the friction of the brake to the rubbing surface of the brake, and let \( R \) be their resultant—positive if resistance, negative if effort preponderates. Then
\[ s = E/(F + R). \] (79)

\( \S 123. \) Energy distributed between two Bodies: Projection and Propulsion.—Hitherto the effort by which a machine is moved has been treated as a force exerted between a movable body and a fixed body, so that the work done by the machine can be ascribed to the movable body, and none upon the fixed body. This conception is sensibly realized in practice when one of the two bodies between which the effort acts is either so heavy as compared with the other, or has so great a resistance opposed to its motion, that it may, without sensible error, be treated as fixed. But there are cases in which the motions of both bodies are appreciable, and must be taken into account—such as the projection of projectiles, where the velocity is inversely proportional to their weights, according to the principle of dynamics, already quoted in a note to \( \S 110 \), that the mutual actions of a system of bodies do not affect the motion of their common centre of gravity.

For example, if the weight of a gun be 160 times that of its ball, the energy exerted by the powder in exploding will be employed in propelling the ball, and in producing the recoil of the gun, provided the gun up to the instant of the ball’s quitting the muzzle meets with no resistance to its recoil except the friction of the ball.

\( \S 124. \) Centre of Percussion.—It is obviously desirable that the deviations or changes of motion of oscillating pieces in machinery should, as far as possible, be effected by forces applied at their centres of percussion.

If the deviation be a translation—that is, an equal change of motion of all the particles of the body—the centre of percussion is obviously the centre of gravity of the body. According to the law of the principle of dynamics, already quoted in a note to \( \S 116 \), the moment of percussion is the energy exerted by the powder in exploding; and this is the centre of percussion.

If the deviation be a rotation about an axis traversing the centre of gravity, there is no centre of percussion; for such a deviation can only be produced by a couple of forces, and not by any single force. Let \( \alpha \) be the deviation of angular velocity to be produced by the couple \( M \) and the distance \( d \), and let \( \alpha a \) be the inertia of the body about an axis through its centre of gravity; then
\[ 1/2 \alpha \alpha = 1/2 \alpha a \alpha \]

is the variation of the body’s actual energy. Let \( M \) be the moment of the unbalanced couple required to produce the deviation; then
\[ \alpha = M \alpha a \alpha \]

and the work in the interval \( dt \) is \( Md \alpha \), which, being equated to the variation of energy, gives
\[ M = \frac{\alpha^2}{a} \]

\( \S 125. \) The radius of gyration of the body with regard to an axis through its centre of gravity.

Now (fig. 133) let the required deviation be a rotation of the body BB about an axis O, not traversing the centre of gravity G, \( d \alpha \)
being, as before, the deviation of angular velocity to be produced in the interval $dt$. A rotation with the angular velocity $\omega$ about an axis $O$ may be considered as compounded of a rotation with the same angular velocity about an axis through $O$ parallel to $O$ and a translation with the velocity $v$, $O$, $O$ being the perpendicular distance between the two axes. Hence the required deviation may be regarded as compounded of a deviation of translation $dv=Og$. $da$, to produce which there would be required, according to equation (82), a force applied at $C$ perpendicular to the plane $OC$—

$$F = \frac{W}{OC} \cdot da$$

(84)

and a deviation $da$ of rotation about an axis drawn through $G$ parallel to $O$, to produce which there would be required a couple of the moment $M$ given by equation (83). According to the principles of statics, the resultant of the force $p$, applied at $C$ perpendicular to the plane $OG$, and the couple $M$ is force equal and parallel to $F$, but applied at a distance $GC$ from $G$, in the prolongation of the perpendicular $OG$, whose value is

$$GC = \frac{M}{p} = \frac{R^2}{OG}.$$

(85)

Thus determined the position of the centre of percussion $C$, corresponding to the axis of rotation $O$. It is obvious from this equation that, for an axis of rotation parallel to $O$ traversing $G$, the centre of percussion is at the point where the perpendicular $OG$ meets $O$.

§ 125.* To find the moment of inertia of a body about an axis through its centre of gravity experimentally.—Suspend the body from any conveniently selected point near the centroid of its volume of bob. Adjust the length of the plumb-line until it and the body oscillate together in unison. The length of the plumb-line, measured from its point of suspension to the centre of the bob, is for all practical purposes equal to the length of the bob being the centre of percussion corresponding to the selected axis $O$. From equation (85)

$$R^2 = CG \times OG = (OC - CG)OG.$$

The position of $G$ can be found experimentally; hence $OG$ is known, and therefore $R^2$ can be calculated from which and the ascertained weight $W$ of the body the moment of inertia about an axis through $G$, namely, $Wg \times R^2$, can be computed.

§ 126.* To find the force competent to produce the instantaneous acceleration of any link of a mechanism.—In many practical problems it is necessary to know the magnitude and position of the forces acting to produce the accelerations of the several links of a mechanism. For a given link, this force is the resultant of all the accelerating forces distributed through the substance of the links which is required to produce the acceleration of each particle, and the determination of this force depends upon the principles of the two preceding sections. The investigation of the distribution of the forces through the material and the stress consequently produced belongs to the subject of the Strength of Materials. Let $Bk$ (fig. 134) be any link moving in any manner in a plane, and let $G$ be its centre of gravity. Then its motion may be analysed into (1) a translation of its centre of gravity; and (2) a rotation about an axis through its centre of gravity perpendicular to its plane of motion. Let $a$ be the acceleration of the centre of gravity and let $A$ be the angular acceleration about the axis through the centre of gravity; then the force required to produce the translation of the centre of gravity is $F=Wa$, and the couple required to produce the angular acceleration about the centre of gravity is $M=IA$, where $I$ is being supposed the moment of inertia of one point $K$ known completely. The acceleration of a second point, usually taken at the centre of the crosshead pin, can be found by the principle of § 82, but several special geometrical constructions have been devised for this purpose, notably the construction of Kicin, discovered also independently by Kirsch. But probably the most convenient is the construction due to G. T. Bennett which is as follows: Let $OK$ be the crank and $KB$ the connecting rod, and let $K$ be a point on the connecting rod such that $KL \times KB = KO$. Then, the crank standing at any angle with the line of stroke, draw $LP$ at right angles to the connecting rod, $PN$ at right angles to the line of stroke $OB$ and $NA$ at right angles to the connecting rod. Then $AN$ is the acceleration of the point $B$ to the scale on which $KO$ represents the acceleration of the point $K$. The proof of this construction is given in The Balance of Engines.

The finding of $K$ may be continued thus: join $AK$, then $AK$ is the acceleration image of the rod, $OKA$ being the acceleration diagram. Through $G$, the centre of gravity of the rod, draw $Gg$ parallel to the line of stroke, thus dividing the image in $g$ in the proportion that the connecting rod is divided by $G$. Hence $Og$ represents the acceleration image of $g$ (the gravity centre) relative to the weight of the connecting

---

rod being ascertained, $F$ can be immediately calculated. To find a point in its line of action, take a point $Q$ on the rod such that $KQ \cdot QG = R^2$, $R$ having been determined experimentally by the method of § 125; join $G$ with $Q$ and through $Q$ draw a line parallel to $BQ$. The position of the action of the resultant force $F$; hence through $Z$ draw a line parallel to $QG$. The force $F$ acts in this line, and thus the problem is completely solved. The above construction for $Z$ is a corollary of the general theorem given in § 129. Impact. Impact or collision is a pressure of short duration exerted between two bodies.

The effects of impact are sometimes an alteration of the distribution of energy between the two bodies, and also a transfer of a portion of that energy, depending on the imperfection of the bodies, in permanently altering their figures, and producing heat. The determination of the actual energy after impact and the loss of energy is effected by means of the following principles:

I. The motion of the common centre of gravity of the two bodies is unaltered by the collision.

II. The loss of energy consists of a certain proportion of that part of the actual energy of the bodies which is due to their motion relatively to their common centre of gravity.

Unless there is some special reason for using impact in machines, it ought to be avoided, on account not only of the waste of energy which it causes, but from the damage which it occasions to the frame and mechanism.

(W. J. M. R.; W. E. D.)

MECHANICVILLE, a village of Saratoga county, New York, U.S.A., on the west bank of the Hudson River, about 20 m. N. of Albany; on the Delaware & Hudson and Boston & Maine railways. Pop. (1900), 4695 (702 foreign-born); (1905, state census), 5877; (1910), 6634. It lies partly within Stillwater and partly within Half-Moon townships, in the bottom-lands at the mouth of the Anthony Kill, about 1/2 m. S. of the mouth of the Hoosick River. On the north and south are hills reaching a maximum height of 200 ft. There is ample water power, and there are manufactures of paper, sash and blinds, fibre, &c. From a dam here power is derived for the General Electric Company at Schenectady. The first settlement in this vicinity was made in what is now Half-Moon township about 1680. Mechanicville (originally called Burrow) was chartered by the county court in 1839, and incorporated as a village in 1870. It was the birthplace of Colonel Ephraim Elmer Burrows (1837-1891), the first Federal officer to lose his life in the Civil War.

MECHITARIANS, a congregation of Armenian monks in communion with the Church of Rome. The founder, Mechitar, was born at Sebasta in Armenia, 1676. He entered a monastery, but under the influence of Western missionaries he became possessed with the idea of propagating Western ideas and culture in Armenia, and of converting the Armenian Church from its monophysitism and uniting it to the Latin Church. Mechitar set out for Rome in 1695 to make his ecclesiastical studies there, but he was compelled by illness to abandon the journey and return to Armenia. In 1696 he was ordained priest and for four years worked among his people. In 1700 he went to Constantinople and began to gather disciples around him. Mechitar formally joined the Latin Church, and in 1701, with sixteen companions, he formed a definitely religious institute of which he became the superior. Their Uniat propaganda encountered the opposition of the Armenians and they were persecuted, driven out, and scattered over the Venetian territory, and there built a monastery, 1706. On the outbreak of hostilities between the Turks and Venetians they migrated to Venice, and the island of St. Lazzaro was bestowed on them, 1717. This has since been the headquarters of the congregation, and here Mechitar died in 1749, leaving his institute firmly established. The rule followed at first was that attributed to St. Anthony; but when they settled in the West modifications from the Benedictine rule were introduced, and the Mechitarians are numbered among the lesser orders affiliated to the Benedictines. They have ever been faithful to their founder's programme. Their work has been fourfold: (1) they have brought out editions of important patriotic works, some Armenian, others translated into Armenian from Greek and Syriac originals no longer extant; (2) they print and circulate Armenian literature among the Armenians, and thereby exercise a powerful educational influence; (3) they carry on schools both in Europe and Asia, in which Uniat Armenian boys receive a good secondary education; (4) they send out Uniat missionaries in Armenia. The congregation is divided into two branches, one being at St. Lazzaro and Vienna. They have fifteen establishments in various places in Asia Minor and Europe. There are some 150 monks, all Armenians; they use the Armenian language and rite in the liturgy.

See Vita del serio di Dio Mechitar (Venice, 1901); E. Boré, Saint-Lazare (1835); Max Heimbucher, Orden u. Kongregenionen (1907) I. § 57, and the articles in Wetzer u. Welte, Kirchenlexicon (1902), R. Kahl, Rittergeschichte, R. Platemann (ed.), also articles by Festi, a Mechitari, in Rivaustria benedictina (1906), "La Congregazione Mechitari." (E. C. B.)

MECKENBURG, a territory in northern Germany, on the Baltic Sea, extending from 53° 4' to 54° 22' N. and from 10° 35' to 13° 57' E., unequally divided into the two grand duchies of Mecklenburg-Schwerin and Mecklenburg-Strelitz.

MECKENBURG-SCHWERIN is bounded N. by the Baltic Sea, W. by the principality of Ratzeburg and Schleswig-Holstein, S. by Brandenburg and Hanover, and E. by Pomerania and Mecklenburg-Strelitz. It embraces the dukedoms of Schwerin and Güstrow, the district of Rostock, the principality of Schwerin, and the barony of Wismar, besides several small enclaves (Ahrensburg, Rosston, Tretzelband, &c.) in the adjacent territories. Its area is 50,890 sq. m. Pop. (1905), 625,045.

MECKENBURG-STRELI SIZ is comprised of two detached parts, the duchy of Strelitz on the E. of Mecklenburg-Schwerin, and the principality of Ratzeburg on the W. The first is comprised by a tract of land ceded to Pomerania and Brandenburg, the second by Mecklenburg-Schwerin, Lauenburg, and the territory of the free town of Lübeck. The total area is 1130 sq. m. Pop. (1905), 193,431.

Mecklenburg lies wholly within the great North-European plain, and its flat surface is interrupted only by one range of low hills, intersecting the country from south-east to north-west, and forming the watershed between the Baltic Sea and the Elbe. Its highest point is on the higher Bergen (445 ft. above sea-level). The coast-line runs for 65 m. along the Baltic (without including the inlets) for the most part in flat sandy stretches covered with dunes. The chief inlets are Wismar Bay, the Salzhhaff, and the roads of Warnemünde. The rivers are numerous though small; most of them are the remains of the Elbe, which have been separated from the Mecklenburg. Several are navigable, and the facilities for inland water traffic are increased by canals. Lakes are numerous; about four hundred, covering an area of 50 sq. m., are reckoned in the two dukedoms. The climate of the northern Mecklenburg resembles that of Great Britain, but the winters are generally more severe; the mean annual temperature is 48° F., and the annual rainfall is about 26 in. Although there are long stretches of marshy soil along the coast, the soil is generally productive. About 57% of the total area of Mecklenburg-Schwerin consists of cultivated land, 18% of forest, and 13% of heath and pasture. In Mecklenburg-Strelitz the corresponding figures are 47, 21, and 10%. The produce of the land is largely consumed by a great many industries, the chief of which are shipbuilding, logging and the manufacture of timber, the making of bricks and distilleries, the baking of bread, the brewing of beer, and the making of tobacco. The horse and hog woods of Mecklenburg are of a fine sturdy quality and highly esteemed. Red deer, wild swine and various other game are found in the forests. The industrial establishments include a few iron foundries, a small shipbuilding yard, a large paper works, tanneries, brick-fields, soap-works, breweries, distilleries, numerous limekilns and tar-boiling works, tobacco and cigarette factories, and numerous mills of various kinds. Mining is insignificant, though the district is represented in the district. Amber is found on and near the Baltic coast. Rostock, Warnemünde and Wismar are the principal commercial centres. The chief exports are grain and other agricultural produce, live stock, spirits, wood and wood goods. The imports are coal, oil, fish, salt, tobacco, beer and tobacco. The horse and wool markets of Mecklenburg are largely attended by buyers from various parts of Germany. Fishing is carried on extensively in the numerous inland lakes.
MECKLENBURG

1019

Mecklenburg-Schwerin returns six members to the Reichstag and Mecklenburg-Strelitz one member.

In Mecklenburg-Schwerin the chief towns are Rostock (with a university), Schwerin, and Wismar the capital. The capital of Mecklenburg-Strelitz is Neustrelitz. The peninsula of Mecklenburg retains traces of their Slavonic origin, especially in speech, but their peculiarities have been much modified by amalgamation with German colonists. The townspeople and nobility are almost wholly of Saxon stock. The causes of the increase in population is chiefly accounted for by emigration.

History.—The Teutonic peoples, who in the time of Tacitus occupied the region now known as Mecklenburg, were succeeded in the 6th century by some Salvonic tribes, one of these being the Obozites, whose chief fortress was Michelenburg, the modern Mecklenburg, near Wismar; hence the name of the country. Though partly subdued by Charlemagne towards the close of the 8th century, they soon regained their independence, and until the 10th century no serious effort was made by their Christian neighbours to subject them. Then the German king, Henry the Fowler, reduced the Slavs of Mecklenburg to obedience and introduced Christianity among them. During the period of weakness through which the German kingdom passed under the later Ottos, however, they wrenched themselves free from this bondage; the 11th and the early part of the 12th century saw the eb and flow of the tide of conquest, and then came the effective subjugation of Mecklenburg by Henry the Lion, duke of Saxony. The Obozite prince Niklot was killed in battle in 1160 whilst resisting the Saxons, but his son Pribislaus (d. 1178) submitted to Henry the Lion, married his daughter to the son of the duke, embraced Christianity, and was permitted to retain his office. His descendants and successors, the present grand dukes of Mecklenburg, are the only ruling princes of Slavonic origin in Germany. Henry the Lion introduced German settlers and restored the bishoprics of Ratzeburg and Schwerin; in 1170 the emperor Frederick I. made Pribislaus a prince of the empire. From 1214 to 1227 Mecklenburg was under the supremacy of Denmark; then, in 1229, after it had been regained by the Germans, there took place the first of the many divisions of territory which with subsequent reunions constitute much of its complicated history. At this time the country was divided between four princes, grandsons of duke Henry Borwin, who had died two years previously. But in less than a century the families of two of these princes became extinct, and after dividing into three branches a third family suffered the same fate in 1436. There then remained only the line ruling in Mecklenburg proper, and the princes of this family, in addition to inheriting the lands of their dead kinsmen, made many additions to their territory, including the counties of Schwerin and of Strelitz. In 1532 the two princes of this family divided a division of their lands. Stargard being separated from the rest of the country to form a principality for John (d. 1393), but on the extinction of his line in 1471 the whole of Mecklenburg was again united under a single ruler. One member of this family, Albert (c. 1338-1412), was king of Sweden from 1364 to 1380. In 1438 the emperor Charles IV. had raised Mecklenburg to the rank of a duchy, and in 1418 the university of Rostock was founded.

The troubles which arose from the rivalry and jealousy of two or more joint rulers incited the prelates, the nobles and the burghers to form a union among themselves, and the results of this are still visible in the existence of the Landesunion for the whole country which was established in 1533. About the same time the teaching of Luther and the reformers was welcomed in Mecklenburg, although Duke Albert (d. 1547) soon reverted to Rome. In 1555, when he resisted the emperor Frederick I. more than the other dukes, he was deposed and the state religion; a little later the churches and schools were reformed and most of the monasteries were suppressed. A division of the land which took place in 1555 was of short duration, but a more important one was effected in 1611, although Duke John Albert I. (d. 1576) had introduced the principle of primogeniture and had forbidden all further divisions of territory. By this partition John Albert's grandson Adolphus Frederick I. (d. 1658) received Schwerin, and another grandson John Albert II. (d. 1636) received Güstrow. The town of Rostock "with its university and high court of justice" was declared to be common property, while the Diet or Landtag also retained its joint character, its meetings being held alternately at Sternberg and at Malchin.

During the early part of the Thirty Years' War the dukes of Mecklenburg-Schwerin and Mecklenburg-Gustrow were on the Protestant side, but about 1627 they submitted to the emperor Ferdinand II. This did not prevent Ferdinand from promising their land to Wallenstein, who, having driven out the dukes, was invested with the duchies in 1629 and ruled them until 1631. In this year the former rulers were restored by Gustavus Adolphus of Sweden, and in 1635 they came to terms with the emperor and signed the peace of Prague, but their land continued to be ravaged by both sides until the conclusion of the war. In 1638 by the Treaty of Westphalia, Wismar and some other parts of Mecklenburg were surrendered to Sweden, the recompense assigned to the duchies including the secular bishoprics of Schwerin and of Ratzeburg. The sufferings of the peasants in Mecklenburg during the Thirty Years' War were not exceeded by those of any other part of Germany; most of them were reduced to a state of serfdom and in some cases whole villages vanished. Christian Louis who ruled Mecklenburg-Schwerin from 1658 until his death in 1692 was, like his father Adolphus Frederick, frequently at variance with the estates of the land and with members of his family. He was a Roman Catholic and a supporter of Louis XIV., and his country suffered severely during the wars waged by France and her allies in Germany.

In June 1692 when Christian Louis died in exile and without sons, a dispute arose about the succession to his duchy between his brother Adolphus Frederick and his nephew Frederick William. The emperor and the rulers of Sweden and of Brandenburg took part in this struggle which was intensified when three years later, on the death of Duke Gustavus Adolphus, the family ruling over Mecklenburg-Gustrow became extinct. At length the partition Treaty of Hamburg was signed on the 8th of March 1701, and a new division of the country was made. Mecklenburg was divided between the two claimants, the shares given to each being represented by the existing duchies of Mecklenburg-Schwerin, the part which fell to Frederick William, and Mecklenburg-Strelitz, the share of Adolphus Frederick. At the same time the principle of primogeniture was again asserted, and the right of summoning the joint Landtag was reserved to the ruler of Mecklenburg-Schwerin.

Mecklenburg-Schwerin began its existence by a series of constitutional struggles between the duke and the nobles. The heavy debt incurred by Duke Charles Leopold (d. 1747), who had joined Russia in a war against Sweden, brought matters to a crisis; the emperor Charles VI. interfered and in 1728 the imperial court of justice declared the duke incapable of governing and his brother Christian Louis was appointed administrator of the duchy. Under this prince, who became ruler de jure in 1747, there was signed in April 1755 the convention of Rostock by which a new constitution was framed for the duchy. By this instrument all power was in the hands of the duke, the nobles and the upper classes generally, the lower classes being entirely unrepresented. During the Seven Years' War Duke Frederick (d. 1783) took up a hostile attitude towards Frederick the Great, and in consequence Mecklenburg was occupied by Prussian troops, but in other ways his rule was beneficial to the country. In the early years of the French revolutionary wars Duke Frederick Francis I. (1756-1837) remained neutral, but in 1807 was taken possession of by Napoleon's army, which had overthrown the French government. By the Treaty of Paris of 1815 the French were driven out and the duchy was restored to the Duke. At the Convention of Rostock in 1812 a league of dukes was formed, who were to be elected by the townsmen, but in 1814 the duchy was annexed by Prussia. In 1815 the Duke was restored by the Congress of Vienna.
made to the democracy were withdrawn and further restrictive measures were introduced in 1851 and 1852.

Mecklenburg-Strelitz adopted the constitution of the sister duchy by an act of September 1755. In 1806 it was spared the infliction of a French occupation through the good offices of the king of Bavaria; in 1808 its duke, Charles (d. 1816), joined the confederation of the Rhine, but in 1813 he withdrew therefrom. Having been a member of the alliance against Napoleon he joined the Germanic confederation in 1815 and assumed the title of grand duke.

In 1866 both the grand dukes of Mecklenburg joined the North German confederation and the Zollverein, and began to pass more and more under the influence of Prussia, who in the war with Austria had been aided by the soldiers of Mecklenburg-Schwerin. In the Franco-German War also Prussia received valuable assistance from Mecklenburg, Duke Frederick Francis II. (1823-1883), an ardent advocate of German unity, holding a high command in her armies. In 1871 the two grand duchies became states of the German Empire. There was now a renewal of the agitation for a more democratic constitution, and the German Reichstag gave some countenance to this movement. In 1897 Frederick Francis IV. (b. 1882) succeeded his father Frederick Francis III. (1851-1897) as grand duke of Mecklenburg-Schwerin, and in 1904 Adolphus Frederick (b. 1848) a son of the grand duke Frederick William (1819-1904) and his wife Augusta Carolina, daughter of Adolphus Frederick, duke of Cambridge, became grand duke of Mecklenburg-Strelitz. The grand dukes still style themselves princes of the Wends.
